Finer's approach emphasizes the *accountability* in administrative responsibility. Above all he wants an answer to the question, responsible to whom? A formal understanding of authority emphasizes a story about democracy. Through elections, citizens choose who will wield lawful authority and delegate certain powers to the elected officials. Through lawmaking, elected officials constitute authority and delegate certain powers to appointed or civil servant officials. The delegation continues, sometimes downward through hierarchical organizations, to other levels of government (with their own procedures for constituting authority), and sometimes to private actors who carry out the work of public authorities. Let us stipulate that these features of bureaucratic authority are, to use Weber's term, ideal/typical relationships, rather than the result of empirical analysis of the operation of bureaucracies. Finer was part of a movement in public administration that sought to find principles of administration that could be applied anywhere.

As such, the Finer position does not have a clear place to put questions raised by the other dimensions suggested above. Whether our concern is with organizational performance, with effects on some features of democracy, or broader questions of the representativeness of the controlling institutions, these are herded into a general category of oversight of bureaucratic management. The questions about context are taken as givens or not asked at all.

Friedrich wanted to emphasize the many departures from the ideal/typical relationships. He was a political theorist who emphasized the need to understand the critical methods of historical research and this at a time when the discipline outside of political theory was moving away from this position. The way Dwight Waldo put it, "despite occasional claims that public administration is a science of universal validity, American public administration has evolved political theories unmistakably related to unique economic, social, governmental, and ideological facts" (Waldo 1948, p. 3.). Standards of appropriate behavior are going to be negotiated over time among political actors, actors we refer to in the twenty-first century as *stakeholders*. Constituencies are not simply made up of voters, but also of neighbors, of the news media, fellow professionals, and other parts of the social fabric that confer expectations, reputation, and tools for critical reflection. These change over time. The changes were the focus of much of Friedrich's empirical work on governments.

One way to characterize the different positions is by discipline. Part of public administration is strongly influenced by political science and its focus on power (Henry 1987). Explanations with that focus usually employ concepts that draw attention to elections, changes of administration, shifts in public mood, ideological distribution of elected officials, pressure group campaigns, feedback on existing programs, and crises and other focusing events that prompt action by officials in positions of authority. Students of administrative responsibility have tended to examine the ways these many strands influence professional and personal values of administrators.

Occasionally academic gatherings have attempted to bring more conceptual coherence to the field – the Minnowbrook Conference and publication of the Blacksburg Manifesto were two – but public administration is very far from having a consensus theoretical core.

One way out of the difficulty of defining the relationship between bureaucracy and democracy is to develop more knowledge of how bureaucracies are constituted and shaped by authorities, how management matters, and how bureaucratic values and norms shape outcomes (Meier and O'Toole 2006). Out of that knowledge, a current focus of the field will perhaps emerge a better understanding of how we actually work through the tension. Such knowledge is essential to an informed discussion of administrative responsibility.

But more likely is that the original answers of Wilson, Weber, and Friedrich pointed to irresolvable tensions. There is no problem to fix aside from the central dilemma of representative governments. Represent *whom*? Woodrow Wilson clearly did not envision representation for many people we now recognize as full citizens in a democracy. But he also believed in vigorous antitrust laws and their enforcement and would likely be appalled by the oligarchic nature of today's politics in the USA. Administrative responsibility has several dimensions.

Wilson had his blind spots. We have ours.

## Size and Complexity

The size and scope of government activities increased dramatically in the twentieth century. In all of the wealthy capitalist countries, the largest impetus to growth was war, followed by responses to crises like the Great Depression, the demands of formerly excluded citizen groups, and growing recognition of problems like industrial pollution. The dynamic of growth shifted the grounds of political participation (Pierson and Skocpol 2007). The growth of activist government helped to bring about a change in patterns of civic voluntarism toward more professionally managed organizations. The *public* in public life became more bureaucratized, encouraging widespread policy changes but with no concomitant popular mobilization. A conservative reaction to the new activist roles of government included organizing across class boundaries to produce a populist base for a newly invigorated Republican party, in the case of the USA. So while the scope and size of government grew, by the last quarter of the twentieth century, so did the organized opposition to the new activist government presence.

In the USA, this was complicated by its separation of powers constitution, which does not define administrative functions or powers at all. The early creation of somewhat independent regulatory agencies and the later creation and expansion of executive branch departments present problems of control less readily answered than under parliamentary systems in which elected officials are typically installed as heads of agencies. Some contemporary government powers are simply beyond anything remotely on the minds of people who wrote various clauses and amendments. To take an extreme example, the President of the USA is never more than a few yards from a person that carries a machine that enables the President to launch nuclear weapons on another country. Less extreme are the hundreds of agencies that carry out the new roles of government, but are set up and run in that strange new context of reconfigured activism and civic participation.

The Minerals Management Service was one such example. It was responsible for approving leases and drilling plans for offshore oil drilling, both the management of the lease process and the safety of the operations. As it turned out, the agency was much better at the former than the latter. The well blowout that polluted the Gulf of Mexico in 2010 was entirely preventable, but the Minerals Management Service accepted the judgment of the drilling companies that their procedures were adequate. An additional half-million-dollar piece of equipment would have stopped the blowout very soon after it occurred. Not long after the episode, the agency was divided into several parts, with one responsible for encouraging drilling and a separate part responsible for safety.

It takes bitter experience to persuade elected officials to take administrative responsibility seriously. The political context rarely permits such clarity of focus on the part of government organizations.

Another contemporary complication in the administrative state is the increasing use of private corporations to do the work of government. This is largely due to an ideological shift in our politics, and it raises significant accountability issues. Is there less access for democratic control of the public's business? Is the revolving door between government and the private sector a conduit for improper influence over public resources? Here are two examples of the shift in styles of governance.

The original Tacoma Narrows Bridge was a classic disaster, and film footage of its collapse is widely available. It was built as a piece of public infrastructure, opening within months of the Friedrich/Finer debate, to facilitate automobile and truck traffic. But it catastrophically collapsed, largely because engineers had little experience with the particular design features of this bridge, although the lessons of the failure have influenced the design of every long bridge built since. The $6.4 million construction cost and one dog were casualties of the collapse. The second bridge was also a piece of public infrastructure, built and owned by government, and maintained by government employees. It opened a decade after the Friedrich/Finer debate. Its costs were covered by bonds to be paid off by tolls, which exceeded the estimated revenues. The tolls were dropped 13 years earlier than expected. A decision to build a third bridge beside the second was made in the late 1990s. The bridge was put beside the old one because the political opposition was small compared to other preferred locations and because the tolls were collected in a place where drivers had no practical alternatives, in effect a captive audience. The newest was built through a "public/private partnership," a new arrangement connected to the state transportation department through a commission and a citizens' advisory group. The latter is made up of unpaid members of the public, appointed by the Governor, whose role is to look at the various costs of paying for bridge maintenance and debt service and to recommend toll raises when the costs exceed the current toll revenue. This indirect public involvement is assigned a bureaucratic, not a democratic role. The head of the state transportation department at the time of this deal was a former member of Congress who actively pushed the new model of public/private partnerships that promised a continuing revenue flow to a private corporation. Due to a legal complication over bridge financing, the Department of Transportation had to step in as

supervisor to construction and toll collection. The new model had a steep learning curve.

A second example of the use of private contractors came in the second US invasion of Iraq, in 2003. Back in the early 1990s, Secretary of Defense Richard Cheney commissioned a study by the Halliburton corporation to see if a private entity could supply the armed forces with most of its logistical needs. Halliburton found that it could and was awarded lucrative contracts to do so. Not long after leaving his post at the Pentagon, Cheney became CEO at Halliburton and oversaw an expansion of the logistical work in many countries. After the election of 2000, Cheney was again in government service, this time as Vice President. He left the company with the largest severance package in its history. Within his first year of service as Vice President, Halliburton and its subsidiary KBR were awarded a lucrative 10-year contract to expand its logistical services to our military. During the Iraq War, after the 2003 invasion, Halliburton was paid over $39 billion for its services.

In both of these examples, the lines of accountability run through legislative oversight. To understand why legislatures do, or do not, engage in effective oversight is a complicated matter that can perhaps be started by examining ideological shifts in states' and national legislatures over the last generation. The growth of public/private partnerships is in significant part an outcome of growing conservatism, particularly in US politics.

## Conclusion

Bureaucracy entails an implicit delegation doctrine. It is simply impossible to build these large, complicated organizations and expect effective oversight by elected officials. Friedrich believed we have to work with the problems that emerge from bureaucracy, in our own political systems, with the problems we face at a given time, and he believed we were up to the task. Final called the development of indirect controls of bureaucracy a new form of despotism.

Administrative responsibility is about authority in modern representative governments. The more than century-long development of what Weber called legal-rational authority has changed how we live, and yet we keep telling ourselves the same story about authority, but with entirely new meaning. We get used to more bureaucracy and less effective representative government, and we still call it representative democracy.

# Administrative System of the European Union

Ani Matei and Madalina Cocosatu
National School of Political Studies and Public Administration, Bucharest, Romania

## Synonyms

European public administration; European Union administration; Integrated administration

## Definition

"European Union public administration" represents a European reality, based upon the European law that represents the synergy of the European institutional development, the creation and functioning of the internal market, of the financial and budgetary policies, and of the external, security, and judicial cooperation policies and, last but not least, of the relations between the European Union and the national, regional, and local administrations (Hoek 2005).

The EU administration is an "atypical concept in a traditional approach of public administration that allows important developments closing it to the modern theories of public management" (Matei 2005), "a political hybrid between a national and international administration" (Nedergaard 2007).

The European administration comprises European and national elements that create a multipolar system having a complex architecture, which is ideally and legally represented by the EAS. From this perspective, the European administration is more and more a reality as the European integration and construction process deepens and extends. Still, the above characterization is not enough since the European administration is currently "a curios hybrid, a result of the continuous interaction between supranational and national" (Kassim 2003).

The European administration may be considered from a formally or organizational standing point and a material or functional one.

From the organizational point of view, the European administration may be sketched so as to largely bring together all the European and national institutions and structures that are involved in the organization and execution of the provisions set forward in both the European treaties and in other European legal acts and the national legal frameworks. Stricto sensu, the European administration would name all the European institutions and structures that bear administrative competencies. These two spheres of European administration are complementary linked in a body-part relationship, one that suggests systemic interactions, including hierarchical ones. The two spheres are to be added to the ones of national administrations of member states and are considered as parts of the European administration (lato sensu defined) and quasi-hierarchic situated in relation to the European administration (stricto sensu defined). The two spheres are administratively cooperating with other public administrations of the member states (Matei and Matei 2010, p. 17).

## Introduction

The debates on the concept of EU administration are frequent and tend to trigger the attention toward the usual absence from the texts of the constitutive treaties of certain clear and direct provisions on administration.

The role and nature of European public administration is extended and subject to a major transformation, and it must be understood in correlation with the term of governance, which presupposes a complex system in which public administration entails collaboration efforts, partnerships, and regulation activities performed in strong connection with national administrations; with civil society; with nongovernmental organizations and government agencies; with the local, regional, and national authorities and institutions; as well as with other categories of stakeholders involved in the decision-making process in society.

The EU administration has developed simultaneously with the construction of the United Europe on a distinct area that overlaps with the EU area in its various enlargement stages. In a regulatory perspective, the EU administration has benefited due to the constitutive treaties, from a contextual ground containing relatively few direct and explicit assertions, but which valorize the European traditions and culture, mainly in the member states, integrating creatively the international developments of public management.

Currently, "there is an intense cooperation between administrative actors of Member States in all the phases of the practical cycle, meaning: agenda setting, decision-making and implementation" (Hofmann and Türk 2006), which proves

that the classical model of European administration is different from the reality within the European Union and requires a new approach.

## Legal Framework of European Public Administration as a Multilevel Administration

The legal basis of the EU administration is to be found however, even if it disappeared, in the constitutive treaties of the European Union.

The functioning and organization methods of the EU institutions most certainly emphasize the fact that they cannot be compared to any other existing structure, whether it is a state or an international organization.

The European Union is a union of states, but it is also a union of peoples. From this point of view, the Commission represents, first of all, the common interest of the states, although it cannot be equated with a true national Executive. As regards legislative power, the exercise of legislative power is done differently, and it belongs not only to the European Parliament but also to the Council.

The starting point in the legal delimitation of the European Union administration is the provisions of Art. 13(1) of the Treaty on the European Union, as well as the content of the Sixth Part "Institutional and Financial Provisions" of the Treaty on the Functioning of the European Union (TFEU) which establishes the institutional framework of the European Union. In the same time, these articles represent the legal foundations for the administrative institutions of the European Union. Article 17(1) of TEU sustains the administrative character of several institutions; among them, the most important is the European Commission which "exercises coordinating, executive and administration functions, as laid down in the Treaties."

Likewise, the organization and functioning of European administration are also based on the Rules of Procedure of the European Parliament, Rules of Procedure of the Commission, The Working Methods of the European Commission, Council Regulation (EC) 58/2003 laying down the statute for executive agencies to be entrusted with certain tasks in the management of Community programmes, and Rules of Procedure of European Court of Justice.

## Systemic Considerations About European Union Administration

Regarding the structure of the European administration system, unlike any other social systems, is multiplane and tridimensional, in the sense that the administrative actions take place, mostly simultaneously, in parallel plans. These parallel plans refer on one side to the member states' administrations, and 27 on the other, at the EU administration, concentrated around the European Commission (the main plan) and national or regional administrations (secondary plans). According to both of these plans, a specific typology of the administrative actions of axiological, guidance, or executive actions emerges. This means that in each of those plans, one can identify the multilevel systems of administration: European, regional, and national, for the European administration plan, or national, territorial, and local, for the member states' administrations, the secondary plan.

The European Union adopted a more complex institutional structure than the one that exists in a state, in order to enable the participation of states and peoples to the community ensemble, without transposing the institutional system that results from the application of the principle of separation of powers.

In so far as the relations between the different subsystems, these may be of different kinds:

- Quasi-hierarchical relations, present between EU administrative institutions and the national administrations. Although one cannot speak of a subordination of the national administration in relation to the European ones, there are, however, relations of hierarchical nature that derive from the member states obligation to see the treaties provisions implemented and the preeminence of the European legislation on national rules (Fig. 1).

**Administrative System of the European Union, Fig. 1** Mechanisms for general adjustment of the European administration. (Source: Matei and Matei 2010, p. 37)

- Administrative cooperation relations, active both between the EU administrative institutions and the national ones. *Governing within the states is being conducted more and more on the basis of public-private partnerships, and* via *formal and informal networks involving state and non-state agencies, whereas, on an international level, states and other entities are regulated* via *an extended network of conventions, treaties and international agencies, all of which operate without the support of an encompassing hobbesian power/constraint (*Hindess 2005).
- Hierarchical relations, in the traditional way, that one may find both in the European institutions administrations and the particular subsystems of the member states' administrations.
- Referring to the cybernetic character of the European administrative systems, the latter are active through the specific mechanisms of self-regulation.

As a system, the European administration has three important characteristics: it is complex, open, and dynamic and cybernetic. It is however possible to add a few more. These continue and develop the specifics of the EAS, thus operationalizing the concepts, principles, and beliefs that lay down on the basis of the EAS' construction.

The European administration is a system with many characteristics described in many reference papers of the literature (Kassim 2003). With the correct adaptation of the context, the above may be formulated as follows:

(a) Lack of an agreed demarcation of competencies and powers between the EU administration and the national administrations; we add to this that EU as a unified system has a complex structure, based on three pillars with different decisional powers, structures, and procedures.
(b) Fluidity. Many studies have described the Union as a "fluid, ambiguous and hybrid" since "there is no shared vision or project or common understanding pf the legitimate basis of a future Europe" (Olsen 1997). Of course, these remarks are previous to the Treaty of Lisbon, yet they are still at least partially pertinent. It cannot be argued upon the fact that EU is in a constant becoming step, in which its membership, rules, relationships, authorities, and institutions are constantly evolving and its competencies and functions ever-changing.
(c) Institutional fragmentation, by means of which the power at the European level is shared between several institutions, and there is no single authoritative legislator. Legislative power is shared by two institutions – the Council and the European Parliament – that form a "classic two-chamber legislature" (Hix 1999), and executive authority is spread between the member states (individually and collectively) and the Commission.
(d) The complexity of the EU policy process is a consequence of the fact that the decision-making into EU involves a multiplicity of actors, including, besides the member states, the EU institutions and other European bodies and agencies, representatives of the regional and local authorities, and lobby groups. Each is at once an actor with its own interests, an institution with its own rules, code of conduct, and operating style.
(e) Sectorialization, which shows a specific logic for the construction of the EU. A broad distinction is to be made between constitutional matters, such as treaty negotiations, institutional reform, and enlargement, which involve heads of the state and government and foreign ministries – and routine policy of regulatory, redistributive, or distributive nature.
(f) Decision-making and behavioral dynamics. Decision-making can be seen as endless streams of premises, of which some may become relevant for decision-making and from which choices occasionally happen (March 1994; Simon 1957).

## Characteristics of the EU Administration

### Multilevel System

The multilevel system indicates the manner in which certain competences are transferred from the national state portfolio to the supranational level and respectively to the subnational, public or private authorities. The actors participating in the elaboration and implementation of EU policies are situated on various administrative levels, and the relationships among them are characterized by partnership and competition.

Multilevel in this administrative context means that a new platform emerges that interlinks the national institutional setup with other corners of the EU system. This platform consists of the paradoxical mix of institutional independence and institutional interconnectedness across levels of government. It consists of separate institutions (such as the Commission) that are able to act (potentially) relatively independently from member state governments and at the same time of an institutional interconnectedness between the very same institutions across levels of governments. Understanding the dynamics of this paradoxical mix – of administrative independence and interdependence – is essential in order to gain an adequate understanding of the multilevel character of the EU administrative system (Bauer and Trondal 2015).

On a supranational level, the main actor is the Commission – the EU government – its position established via treaties causes tensions arising both from the national states and from the Parliament. The Commission has extensive competences in the legislative area, as it is the only institution with legislative initiative. The Commission's legislative proposals are submitted to the Parliament and to the Council, because they reach the Commission in the form of

recommendations coming from the working groups, and before being approved by the Council, the drafts are examined by COREPER. The decisions made at EU level are the Community interests synthesized either via combining or transforming the interests of member states or regions. Through the agreement of member states, some mechanisms have been introduced in order to limit the power of the Commission. The Commission's activity is marked by the fact that the political arm is extremely powerful while being extremely reduced, and therefore, the constituent units – the Commissioners – benefit from a major influence on the whole. The Commission plays an important part in the restructuring of the political system at European level, and the actions it performs are in line with the interest of particular type of actors: on the one hand, territorial communities – subnational actors – and, on the other hand, functional communities, various transnational groups of interests.

### The Incongruence of Competences

The decentralization of competences and the increase in the number of decision-makers are part of the integrated effort of the European Union to render governing more efficient, more democratic, and more legitimate in its representation of the citizens, as well as to bring the Union closer to the citizens.

Regarding the competences of the Union, the Treaty on the European Union clearly stipulates the aspects in relation to which member states must transfer the power of action to the Union and introduces a classification of the competences of the Union.

The delimitation of the competences of the Union is governed by the principle of assignment, and the competences are to be exercised in accordance with the principles of subsidiarity and proportionality. Thus, on the grounds of the principle of subsidiarity, in fields that are not related to its exclusive competence, the Union intervenes only if and to the extent to which the objectives of the envisaged action cannot satisfactorily be reached by the member states at a central, regional, or local level, but, due to the size and expected effects, can be better met at the level of the Union.

### The Importance of Networks

The European administration is a system based on a network in which the institutions working on different governing levels collaborate, leading to the emergence of a new administrative order, of new models and processes of public administration integration, in attaining the objectives set out via polices on a European level.

### Demographic Heterogeneity

The model of the representative bureaucracy assumes that the demographic "baggage" that civil servants bring with them into a bureaucracy profoundly shapes their behavior. It is also assumed that the "diversity of public sector workforce" (Peters et al. 2013) impacts on how public sector organizations perform, how they are internally controlled, how legitimate they are perceived to be, and how they relate to the constituent populations (Andrews et al. 2005; Selden 1998).

Civil servants' former institutional affiliations, their educational backgrounds, their geographical origins, and so on are assumed to affect the way they act in office. The bureaucracy will thus change its performance according to the composition of staff. In short, what civil servants bring with them into the organization is of significance to its conduct (Bauer and Trondal 2015).

Appointment of European public officials is another trait of the autonomy of European institutions; regardless of the fact that the fundamental treaties do not contain provisions in this respect, this is the competence of each institution, in accordance with Staff Regulations of Officials and the Conditions of Employment of Other Servants of the European Economic Community and the European Atomic Energy Community. Each institution establishes its own rules regarding the implementation of the statute, as it results either from an express provision in the statute or from the general power of the institution to freely organize its services.

### Institutional Fragmentation

The power at the European level is shared between several institutions, and there is no single authoritative legislator. Legislative power is

shared by two institutions – the Council and the European Parliament – that form a "classic two-chamber legislature" (Hix 1999), and executive authority is spread between the member states (individually and collectively) and the Commission.

As such, a conclusion with regard to the European administration stems from its unique character, direct consequence of the EU's unique political system. Being unique, the European administration offers a complex image, marked by national and European interpretations and interrelation. National administrations have reached the EU's decisional bodies; they are present in every European area and determine the functioning of every European institution. In the same time, the national civil services acknowledge adaptations in their structures and practices. We may add to this the specific character of the coordination mechanisms at EU institutional level and, with direct link to the national administrations, mechanisms that are permanently articulated and are formally, increasingly consolidated, thus ensuring the foundation for a European public administration system (Matei and Matei 2010).

## Principles of the EU Administration

The principles of the EU administration are:

(a) Reliability and predictability. These attributes derive from the essence of the rule of law which affirms the law supremacy as "multi-sided mechanism for reliability and predictability" (OECD 1999). As an EAS principle, it may be rephrased as "administration through law," a principle meant to assure the legal certainty or juridical security of the public administration actions and public decisions. Other connotations of this principle may be observed when we refer to the opposition of the law supremacy in regard to the arbitrary power, cronyism, or other deviations of the latter that should not be seen as similar to the discretionary power applicable in cases when, within the legal framework, a certain degree of decisional freedom is allowed. Exercising the discretionary power is limited by the principles of administrative law by means of which the public administration is forced into acting in good trust and to follow the public interest, use fair procedures for equal and nondiscriminatory treatment, and respect the legal principle of proportionality.

(b) Openness and transparency draw from the reality that public administration is the resonator of the society, assuring the interface with the citizen, the user of its services. The development of different social phenomena, such as the corruption or maladministration, must be controlled by the society. This urges the administration to become available and to offer sufficient information to the exterior. As such, the openness and transparency refer to these exact attitudes and constitute the necessary instruments for achieving the supremacy of law and the equality before the law and its representatives. Assuring the openness and transparency, we protect both the public and individual interests.

We refer here to practices imposed by the administrative principles, like in the case of administrative actions being accompanied by statements of reasons, etc. To this, we may add the necessity to grant the access to public recordings, the restrictions placed for the civil servants, and the necessity for the chosen authorities to exactly represent the public interest. The Lisbon Treaty sets out a more stable institutional system and advocates in this respect for a more democratic, responsible, and transparent governance. It should be noted that openness gained new characteristics once the public administration was considered to be a public service. In this context, openness becomes acquisitiveness to the citizens or other authorities' initiatives regarding the improvement of public services and their getting closer to the citizen. A new concept emerged, largely described by OECD (1996) that of the open administration.

(c) Accountability. It is one of the instruments showing that principles like the rule of law, openness, transparency, impartiality, and equality before the law are respected; it is

essential to ensuring values such as efficiency, effectiveness, reliability, and predictability of public administration. As it is described by the authors of the EAS, accountability means that any administrative authority or institution as well as civil servants or public employees should be liable for their actions to other administrative, legislative, or judicial authorities. Furthermore, accountability also requires that no authority should be exempt from scrutiny or review by others, which means that, simultaneously or priory, mechanisms for implementation are created.

These mechanisms contain a complex of formal procedures that give a concrete form to the accountability act, as well as supervision procedures that aim to ensure the administrative principle of "administration through law," as it is essential to protect both the public interest and the rights of individuals as well.

(d) Efficiency and effectiveness. The introduction for the public sector and public administration of the efficiency and effectiveness as important values is relatively recent. This fact is topical in the conditions of serious budgetary and fiscal constraints for public services and goods, more generally, for the public sector (Matei 2004).

In this context, efficiency becomes a managerial value that points toward maintaining the optimum equilibrium between the allocated resources and the obtained results, while effectiveness is a connected value that makes sure that the activity of the public administration achieves the intended objectives and solves the public problems recognized by law and the governance process as in its duties.

The analyses in the field show that it is possible to discuss of contradictory developments between assuring efficiency and the rule of law. The European Commission has already intervened, by creating legal institutional solutions – directives to prevent these developments. European Community law also calls for efficient administration, particularly with regard to the application of Community directives and regulations. Relevant to this end, we may note the reinforcement, under the Lisbon Treaty, of the protocol on the application of the principles of subsidiarity and proportionality, where for the Commission, it is stated that "any legislative proposal should contain a detailed statement [. . .] which [. . .] should contain some assessment of the proposal's financial impact and, in the case of a framework law, of its implications for the rules to be put in place by Member States, including, where necessary, the regional legislation" (Art. 4).

## The Administrative Structures of European Union Institutions

### European Parliament's Administrative Structure

The European Parliament's administrative support structure is organized in three main parts:

- The General Secretariat (234 Article, Title XI, Rules of Procedure of the European Parliament)

  The General Secretariat constitutes the main part of the European Parliament administration. The General Secretariat performs its activity under the authority of a Secretary-General, appointed by the Bureau. The Secretariat role is to coordinate legislative work and organize plenary sittings and meetings. The Secretary-General is directly assisted by several services of the European Parliament responsible for organizing the proceedings of European Parliament political bodies such as the Bureau, the Conference of Presidents, and the political groups. In addition to this, a few sensitive services come under the direct supervision of the Secretary-General. Also, the Secretary-General ensures the requisite cooperation and coordination among Directorates-General of the European Parliament: DG for the Presidency; DG for External Policies of the Union, responsible for organizing the work of Parliament's committees and interparliamentary delegations in the field of external policies; DG for Communication, communicates the political nature of the institution and the work carried out by its members; DG for Infrastructure and Logistics, responsible for

managing infrastructure and logistics in Parliament's various places of work; DG for Logistics and Interpretation for Conferences, provides the linguistic, technical, and logistical support for the organization of the parliamentary meetings and conferences of EP members and bodies; DG for Innovation and Technological Support, provides Parliament with information and communication technology services as well as printing and distribution services, implements Parliament's policy of transparency and access to information, and helps Parliament to work more efficiently; DG for Internal Policies of the Union, responsible for organizing the work of Parliament's committees in the field of internal policies and contributing to the exercise and development of the legislative and control powers of the European Parliament; DG for Parliamentary Research Services, provides members with independent, objective, and authoritative analysis of, and research on, policy issues relating to the European Union, in order to assist them in their parliamentary work; DG for Personnel, helps ensure that Parliament's other directorates-general have the human resources necessary to carry out their work; DG for Translation, ensures that Parliament's documents are available in all the official languages of the European Union; DG for Finance; and DG for Security, works to facilitate Parliament activities, while guaranteeing sufficient protection to people, assets, and information.

- The staff of the European Parliament's political groups
- Personal assistants of members of the European Parliament

Members of the European Parliament are free to choose their own assistants within a budget set by Parliament. The relevant terms and conditions are laid down in Chap. 5 of the Implementing Measures for the Statute for Members.

Members of European Parliament (MEP) can choose different kinds of assistants:

(a) Accredited assistants, based in Brussels (or Luxembourg/Strasbourg), are managed administratively directly by Parliament's administration, under the same employment conditions as for temporary EU staff. MEPs can recruit a maximum of three accredited assistants (under certain conditions four). A minimum of a quarter of the total budget must be used for the employment of accredited assistants.
(b) MEPs can also hire "local" assistants based in their member states. They are managed administratively by qualified paying agents to ensure that tax and social security requirements are properly met. A maximum of 75% of the total budget can be used for these local assistants.

Currently, in the European Parliament, around 7500 people work in the General Secretariat and in the political groups.

### European Commission's Administrative Structure

The European Commission is the executive of the European Union.

The European Commission has a unique governance system, with a clear distinction between political and administrative oversight structures and well-defined lines of responsibility and financial accountability. The origins of this system lie in the treaties, but the structure has evolved to adapt to a changing environment and to remain in line with best practice as set out in relevant international standards such as the COSO (Committee of Sponsoring Organizations of the Treadway Commission) 2013 Internal Control-Integrated Framework, the 2014 Conceptual Framework of the International Public Accounting Standards Board, or audit standards as drawn up by the Institute of Internal Auditors (Communication to the Commission 2020).

The Treaties, Rules of Procedure and the present Working Methods organise the European Commission's work to ensure its efficient functioning. The purpose of this document is to describe the Commission's Working Methods and explain how they ensure that the Commission functions as a modern, transparent and performance-oriented institution (Communication from the President to the Commission 2019). Operational implementation of Commission's activity is

delegated to Directors-General and Heads of Service who lead the administrative structure of the European Commission. Directors-General and Heads of Service are responsible for the management of their departments in accordance with the rules and standards laid down by the Commission. They shape the organizational structures of their services, on the basis of the organization charts adopted by the College, to pursue the political objectives of the Commission and fulfil its legal and financial obligations, while striving for efficiency, flexibility, and a high level of performance.

The staff of the European Commission is part of the European public office. Around 32,000 permanent and contract employees work in the European Commission. These include policy officers, researchers, lawyers, and translators.

### European Council's Administrative Structure and Council of the EU's Administrative Structure

The General Secretariat of the Council (GSC) is the body of staff responsible for assisting two EU institutions: the European Council and the Council of the EU, including its presidencies, the Permanent Representatives Committee (COREPER), and the other Council committees and working parties.

In addition to handling the practical organization of meetings and the preparation of related meeting documents, the GSC also chairs the following Council committees and working parties: Security Committee and its subareas (Information Assurance, GNSS experts, Security Accreditation Board), Working Party on Information, Working Party on E-Law, Coordination Committee for Communication and Information Systems, Working Party on Codification of Legislation, and Working Party of Legal/Linguistic Experts.

In present, the General Secretariat employs 3062 staff: officials, temporary and contract staff, and seconded national experts.

### European Court of Justice's Administrative Structure

The Court of Justice of the European Union is made up of two courts: Court of Justice proper and the General Court.

The Registrar, as the institution's Secretary General, coordinates the administrative services under the authority of the President. They provide for the engagement of the services in support of the jurisdictional activity.

The services are mainly grouped under three poles: administrative support services grouped under the Directorate-General of Administration, the linguistic services grouped under the Directorate-General for Multilingualism, and the information services grouped under the Directorate-General for Information.

The Research and Documentation Directorate and the Protocol and Visits Directorate are directly subordinate to the Registrar of the Court.

These services support the activity of the two courts, which, in addition, benefit from their own registry of the court in order to ensure the proper performing of all procedures, as well as the receipt, communication, and storage of all procedural documents.

Two thousand two hundred and fifty six persons, that is, officials, members of the temporary staff, and members of the contract staff, are employed by the Court.

The EU allocates about 6% of its annual budget to expenses related to the staff, administrative expenses, and building maintenance expenses.

## Conclusions

The normative fundaments of the European administration system are mainly traceable in the spirit of the European treaties; the explicit provisions consisting in a mosaic of normative and procedural nature do not follow the legal, constitutional, and administrative custom, to be found in the law systems of member states. This fact creates serious difficulties for the understanding and the setting of a unitary, methodological framework applicable in the cases of administrative phenomena and processes in the European Union. Brought into discussion by the practical administrative procedures and methods over five decades ago, the European administration has evolved in a rather unique and specific manner that differentiates it from any other administrative

system that exists in Europe or elsewhere (Matei and Matei 2010).

In simplified terms, the system of administration in Europe began its development on the basis of a system within "closed" states with national administrations as state-specific structures reflecting different identities and historic traditions of organization (Hofmann 2008).

## Synonyms

Administrative ethics; Governance and ethics of public service; Philosophical ethics; Theories of ethics

## Introduction

Ethics, most broadly, is the study and development of rules for determining and promoting right

or good action rather than wrong or bad action. In public, administrative, and governance settings, the adoption of an administrative theory of ethics and corresponding practices is central to maintaining public trust, fairness, and the appearance of propriety in government action. This entry describes the topic by first locating administrative theory of ethics in broader study of ethics and traces the links between the study of ethics in philosophy to the study and practice of administrative ethics. This treatment also identifies some of the challenges and dilemmas facing both the theory and practice of administrative ethics, as well as contemporary efforts to respond to those challenges.

## Philosophy and the Formal Study of Ethics

The formal study of ethics in philosophy, especially Anglo-American or analytic philosophy, is divided into three separate categories, metaethics, normative ethics, and applied ethics. The first of these areas of study, metaethics, is the most abstract or conceptual of the three and is concerned with questions such as what is the true nature of morality or goodness in the first place. Some philosophers argue that metaethics serves as a foundation or basis from which normative and applied ethics can be developed. In other words, without having a conceptual understanding of what is good and bad, the nature of moral judgments, and the logic or rationale to support or justify moral judgments, it would be impossible to develop robust normative and applied theories of ethics.

Normative ethics is the study of ethical action and the development of theories governing what one's behavior and conduct *should* be. Normative ethicists generally set out to establish moral criteria, embodied in rules, principles, or a logical framework, by which actors can determine how to act in any given circumstance. Normative ethical theories generally fall into one of three categories: duty-based theories, virtue theories, and consequentialist theories.

Duty-based theories include at least two forms that have familiar expressions in modern, Western political systems. The first of these forms, advanced by philosophers including John Locke, is rights-based approach, wherein each member of a community has certain natural or political rights, which in turn imply corresponding duties for all members of that community. The presence of those rights, such as speech or assembly, for example, creates a duty among others, including the state, not to violate or abridge those rights. A second form, found in the work of Immanuel Kant and more recently John Rawls, articulates self-evident principles or categorical imperatives, rather than rights that establish resultant duties. Kant (2002), for example, argues that there is an imperative to treat others as an end rather than as a means. That is, the principle of human dignity and value creates a duty to act in ways that preclude using another as a means of achieving one's own objectives.

Virtue ethics, rather than emphasizing rights or principles and resultant duties or operational rules, seeks to establish right action and behavior by focusing on the character of or virtues embodied by the actor. If the character of the person can be developed, then appropriate action will result. Aristotle's (1947) emphasis on virtues including courage, temperance, justice, and prudence, moderated by the golden mean, is one example of the character traits developed in the tradition of virtue ethics. Although attention to virtue ethics declined through much of the enlightenment era, twentieth-century ethicists including Alasdair MacIntyre (2007) championed and reenergized the consideration of virtue in prescribing right action over what was seen as an overemphasis on rules.

A third normative theory of ethics is consequentialism, which seeks to determine right action by assessing or calculating the balance of good and bad outcomes, or consequences, of an act. The diversity and sophistication of consequentialist ethical theory is substantial, and the two forms described here are intended to both provide a sense of the underlying logic and the expression of consequentialism in administrative theories of ethics. The first, utilitarianism, is perhaps most widely recognized in the work of Jeremy Bentham and John Stuart Mill. In

simplest terms, utilitarianism determines the rightness of an action by calculating the net utility, happiness, or pleasure generated in comparison to the pain that results. Over time, a wide range of formulae have been developed for conducting this calculation, each of which emphasizes different concerns and priorities, such as pleasure by comparison to freedom, happiness, or justice; universal by comparison to individual outcomes; direct or actual outcomes by comparison to intended outcomes; as well as many others. The second form of consequentialism, social contract theory and ethical egoism, can be found in Thomas Hobbes' (1991) influential work. This form of consequentialism assumes individuals to be egoistic or narrowly self-interested. However, because they are also rational and capable of calculating the consequences of various courses of action, the most rational option for any given individual is adoption of a rule-based framework, or social contract, which prescribes behavior in ways that maximize positive outcomes for the individual and minimizes negative impacts both for the individual and for the larger community.

Applied ethics, the final category of ethical study in analytic philosophy, is the moral analysis of specific, often controversial, issues in public and private life. Although there is not a single, comprehensive framework describing all areas of applied ethics, common areas of study include:

- Biomedical ethics including issues such as euthanasia and gene therapy
- Environmental ethics and topics such environmental justice and endangered species protection
- Sexual ethics and concerns including same-sex marriage and abortion

The study of administrative theories of ethics, which also overlaps with organizational ethics, professional ethics, and, to some degree, business ethics, tends to be categorized within applied ethics. While applied ethics generally and administrative ethics specifically are typically treated as a discrete category of study, it is heavily influenced by normative ethical theories.

## Administrative Ethics

As an applied topic, much of the discourse about and around administrative ethics focuses on specific problems or perceived ethical failures of government officials. Public concerns about corruption, conflicts of interest, transparency, and accountability are among the central concerns of administrative ethics.

A common framework used for assessing the actions of actors describes three separate categories of unethical behaviors. The first, misfeasance, describes decision-making, management, or other activities wherein a public official or agent acts in a careless or insufficiently cautious way, resulting in errors or mistakes that have a negative or unfortunate outcome. Misfeasance is distinct from the next category of action, malfeasance, in that it occurs inadvertently and without illegal intent or the violation of policy or law. Malfeasance, then, describes intentionally taken action that is understood by the actor to be either legally or, correspondingly, morally wrong. Malfeasance, by definition, involves dishonesty, illegality, and knowing violation of law, policy, and/or formal authority for improper reasons. The final category, nonfeasance, is the failure of an administrator or agent to perform a duty or task for which they are formally or explicitly responsible, which then results in harm.

Administratively, one of the most common responses to past and potential instances of misfeasance, malfeasance, and nonfeasance is the adoption of a code of ethics, either by a profession or an organization that is designed to prohibit unethical behavior. Although there are many examples of codes of ethics, at least two forms are common and influential with respect to administrative practice, namely, organizational codes of ethics and professional codes of ethics. The first, which may be adopted by specific organizations or by entire entities such as states or municipalities, establishes standards regarding what sorts of behaviors can, must, or must not take place in that organization. Organizational codes of ethics reflect and are specific to the mission and values of each individual organization.

Professional codes of ethics, including that developed by the American Society for Public Administration (n.d.), focus on the principles and responsibilities, as well as the challenges practitioners of a given profession face in the conduct of their work. Professional ethics and associated codes are intended to apply all members of a profession, regardless of organizational setting. Professional ethics is attuned to the standards and desired conduct associated with the particular skills, values, knowledge, and expertise of each profession.

While codes of ethics are common and important in formally and publicly expressing what is or is not acceptable action or behavior for public officials, codes have limitations. One limitation is that while they articulate potential wrongs and limit the likelihood of those wrongs being done, in doing so, they skirt or avoid the issue of doing harm without it being recognized as wrong. That is, a reliance on codes leaves open the possibility, or inevitability, that administrators do harm to others without violating the code and therefore by definition do so without acting unethically. This is the so-called dirty hands problem, in which political actors, especially administrators, find themselves in the unenviable position of having to take action which is ethical but nevertheless does harm. Examples of such behavior might include the use of eminent domain to condemn and take ownership of private property or the use of the government's police power to quarantine individuals who are ill by no fault of their own but nevertheless find their liberty curtailed. The result is the paradox of right actions *and* harm or dirty hands.

The second corresponding difficulty with codes has to do with the potential response to the gap between wrongs and harms. Within an ethical framework that relies on codes as the basis of ensuring ethical behavior, when a gap is identified in the code, the appropriate response is to modify or amend the code to reflect the newly recognized wrong. The consequence of this pattern, however, is a code of ethics that must be infinitely and forever amended and extended. In other words, unless our understanding of ethics is static and finite allowing us to exhaustively identify all right and wrong action, or the world itself does not change in ways resulting in new ethical questions, codes of ethics will have to be extended forever and in infinite ways.

## Normative Theories Implicit in Administrative Ethics

In part, the founding of the United States can be understood as being driven by ethical concerns. To the degree to that the American Revolution was prompted by perceptions of arbitrary, unjust, and even corrupt treatment of colonial subjects by the British Crown, founding documents including the Declaration of Independence, Articles of Confederation, and ultimately the Constitution can be read as articulating a set of ethical claims and establishing a corresponding set of structures and procedures designed to prevent the violation of ethical standards. Although the Declaration of Independence has no legal standing, its articulation of both unalienable rights and governing grievances – violations of ethical standards – sets out a moral and ethical position that remains deeply embedded in American political culture. The US Constitution, and more specifically the Bill of Rights, operationalizes ethical principles into a codified set of political structures, norms, and processes. Those norms, including freedoms speech, assembly, press, and religion, as well as the processes of clarifying and extending ethical norms, whether by amendment, judicial review, or legislation, make real and reinforce the centrality of ethics in all aspects of American politics – including administrative realms.

Although the founding embeds a concern with ethics firmly into the practice and culture of American politics and governance, it also embodies tensions that can be best understood as being expressions of normative rather than applied ethics. That is, the ethical principles present at the founding, and which are embodied in the Constitution and our political culture, can be understood as including elements of duty, consequentialist and virtue ethics. The expression of these forms of normative ethics is, paradoxically,

both central to our ethical expectations and practices but, at the same time, results in thorny forms of tension between the various ethical theories present and the practices that result.

## Normative Ethics in American Politics and Administration

Although administrative ethics is often viewed as primarily applied, there are important expressions of normative ethics present at the founding and running through the history and ethos of public administration that should be recognized.

### Consequentialist Ethics in Administrative Theory and Practice

The formal study or discipline of public administration typically traces its origins to the works of Woodrow Wilson, Max Weber, Frederick Taylor, and other late nineteenth- and early twentieth-century scholars. This foundational work both embraces and establishes a consequentialist ethical logic into the study and practice of public administration. The notion of what is good takes on two different, but interconnected, means at the turn of the twentieth century. One, clearly moral, understanding of the good that can be seen in the political and administrative reform movements of the progressive era is partly a response to the corruption of the spoils system and machine politics of the times. The movement toward a merit-based civil service, and the passage of the Pendleton Act, for example, reflects efforts to improve the moral character of public administration. The idea of merit, or technical competence, reflects a second form of good as well, that of improved effectiveness. Wilson's articulation and advocacy of the politics-administration dichotomy and the systematic study of public administration, as well as Taylor's emphasis on efficiency, appear as being focused primarily on technical competence but in fact simultaneously advance the idea that the effective course of action is also the good or the right course of action. What is good and right is determined based on a calculation of inputs and outputs, costs, and benefits. The requirement for federal agencies to conduct cost-benefit analyses prior to any major policy decisions, which Ronald Reagan established with Executive Order 12291 in 1981, is one example of consequentialism in administrative practice. More recently, work out of the reinventing government and new public management movement has advanced a consequentialist logic in its emphasis on using competition, attention to exchange values, and reduction of transaction costs as a means of maximizing the benefits of government activity while reducing or minimizing the costs of those activities.

### Duty Ethics in the Constitution and Administration

The presence of a duty-based, deontological form of ethics in the form of rights in the Constitution was noted above. Beyond the presence of rights in the founding, much of American political and administrative history continues the concern with rights and the corresponding duty to protect them. This has been largely seen as a political, rather than administrative, concern, in that the discourse of which rights to acknowledge and recognize has played out primarily within and among political institutions, rather than administrative settings. Operationally, the connections between duty, rights, and administrative theories of ethics have developed in at least two ways. The first can be found in work that advances the importance of regime values as the basis of ethical administrative behavior. John Rohr (1989) and Michael Spicer and Larry Terry (1993), in slightly different ways, argue that the values embodied in the Constitution, or *regime values*, should serve as the guide for administrative behavior. Because rights are one of the key expressions of deontological or duty ethics and rights are among the central values both in the Constitution and in the subsequent amendments and Constitutional case law clarifying the original document, deontological ethics can be seen as clearly manifest in their administrative theory of ethics. While his model includes other features as well, the inclusion of moral rules and ethical principles in Terry Cooper's (1990) model of ethical decision-making ties it to this form of deontological ethics as well.

Another variation of deontological ethics can be seen in the emergence of the New Public Administration movement of the late 1960s. The New Public Administration movement developed in response to social changes including the civil rights, equal rights, and anti-Vietnam war movements. Reflecting these social changes, as well as a growing concern that there was an overemphasis on efficiency and technical expertise in both the practice of and training for public administration, scholars and practitioners associated with New Public Administration began to call for increased attention to issues of social justice. In this view, administrators have a responsibility not just to be technically competent and efficient but also an ethical duty to protect and advance the rights of those who are or have been historically marginalized.

### Virtue Ethics in the Constitution and Administration

Although virtue ethics, with some notable exceptions, has largely fallen out of favor since the enlightenment, the idea of virtue and its expression as character in the behavior of administrators is still present in administrative theory and prescribed practice. Administrative ethicists including Mark Lilla (1981) and Edmund Pincoffs (1986) critique dominant approaches to ethics training and practice as either allowing administrators to rationalize any and all preferred actions as being ethical or are so reductionist as to lose sight of the critical, ethical dimensions. Instead, they call for the ongoing, rigorous effort to develop virtue or character in administrators. For Pincoffs, the development of character occurs by ongoing reflection on and assessment of one's own and others' character, not for the sake of judgment but instead for learning and development. Lilla advocates for the establishment and presence of a democratic ethos, which would serve as a sort of backdrop or framework by which character can be examined and developed. Interestingly, Lilla's democratic ethos seems to bear a striking resemblance to Rohr's regime values. Dreyfus and Dreyfus' (2004) work on ethics and the development of expertise further strengthens the tie by describing how the development of virtue may start with a system of rules but in fact comes to be a virtue or part of character with time, practice, and experience.

## Ethical Dilemmas and Contending Values

The preceding section reveals several expressions of normative ethics that are linked to and inform our thinking and practice of administrative ethics. One of the challenges that results from the presence of these varying, and in some cases contending, ethical theories is the potential for ethical dilemmas. For example, there is a classic and often raised tension between utilitarian/consequentialist ethics and deontological ethics, as found in the thought experiment weighing the presence of a ticking bomb against the use of torture to find and disarm it. Such dilemmas reveal a thorny problem at the intersection of politics and ethics, wherein politics, especially democratic politics that is concerned about the achievement of the good life for the political community and all of its members, lies in tension with ethical theories which are driven largely by an assumption that the individual is the primary agent or unit of analysis, if not also being the central or privileged target of or focus for ethical questions.

Another challenge of contemporary ethics has to do with or emerges from real-world complexity and context that, when combined with choice within democratic communities, puts the stability and consistency of principle and practice in tension. For example, as individual communities assess how to balance deontological and utilitarian principles, such as the trade-off between private property rights and the collective benefits that can result for the exercise of eminent domain or the trade-offs between private liberty and public health in considering the use of quarantines in response to outbreaks of infectious disease, it is easy to imagine how distinct communities might come to different, but equally, reasonable conclusions and courses of action. In such cases, consistency and stability of principle gives way to the relative value priorities across communities or even within communities over time. Any given theory from within the major approaches of normative ethical theory aims toward being comprehensive and exhaustive. That is, those theories

aim to answer any and every ethical question in a consistent way. As such, normative ethical theories are not well suited to dealing with the political and social reality of relativism.

## Constructivist and Poststructuralist Approaches

Some contemporary ethical theorists, especially those working out of continental rather than analytic philosophy, conclude that these dilemmas are logically and empirically irresolvable. In their view, there are neither a priori nor a posteriori means derived from either metaethics or normative ethics, by which to resolve these other potential tensions. If this is in fact the case, then at least two ethical questions persist. First, on what basis are we to act or respond given this irresolvability? Second, ethically, what can be or should be done to respond to the presence of sociopolitical power structures that result in unequal or inequitable distribution of harms and benefits within a community? In response to the conceptual and practical limits of normative and applied ethics, some ethical theorists working from a continental, and in some cases poststructuralist, tradition seek to develop prescriptive approaches framed in social structure and process and/or relationship.

Continental and poststructuralist approaches to ethics are comparatively new, especially when compared to the much longer traditions in normative ethical theory. Emerging in the latter half of the twentieth century, continental and poststructuralist approaches of ethics are also heterodox and often conceptually complex. Two in particular, namely, the work of Michel Foucault and Jacques Lacan, have seen substantive treatment in administrative theories of ethics.

### Foucaultian Ethics

French philosopher Michel Foucault spent the first significant portion of his career exploring the history and development of sociopolitical structures or patterned expressions of power and knowledge across a variety of disciplines. He then traces the consequences of these histories or genealogies into contemporary patterns of social and political behavior. Later in his career, Foucault shifted the focus of his studies to include an examination of ethical or moral dimensions of these structures. Much of his later thinking sought to understand the "conduct of conduct" or the means by which conduct or behavior was determined by or open within structures of knowledge and power – what he terms governmentality and biopower/biopolitics. Foucault sets out to consider the degree to which one might be able to act with freedom in the face of these structures and the extent to which they influence or determine conduct. Foucault (1984) takes up the notion of ethics as "care of the self," which he traces to the ancient Greeks, and he explores how care of the self, or the development of the self, meshes with contemporary structures of biopower and governmentality. One specific aspect of Foucault's care of the self, parrhesia, has garnered particular attention in administrative theories of ethics.

Parrhesia, for Foucault and contemporary administrative theorists like Jennifer Eagan (2014) and Louis Howe (2014), is a form of truth-telling, but of a particular sort, that denotes a different understanding of the social world and has implications for how administrators related to and work with the public. First, parrhesia is not simply speaking truth to power in modern way, like that implied by the story of the emperor's new clothes. Instead, parrhesia is the telling of a personal truth, rather than an absolute or universal truth, whether it be based in principle or empirical fact. Parrhesia is not intended purely as a rhetorical, pedagogical, or discursive tool for convincing the listener to do or be something different, though it does require a particular skill for listening, not for rational analysis, but of the capacity for self-care as an attentiveness to how we live our own lives.

This conception of parrhesia and care of the self positions administrators as having to be attuned to their relationship to citizens and to the processes by which they interact with them. Rather than operating narrowly from universalized principle or abstracted calculations of net good or happiness, attentiveness to relationship and process requires ongoing maintenance. At

the same time, this attentiveness is intended to provide sufficient stability and continuity to ensure a degree and sense of sociopolitical equity or fairness.

### Lacanian Ethics

French psychoanalyst Jacques Lacan is perhaps most well known for his theories of language, discourse, and behavior, and his ideas have moved from the level of individual psychotherapy to social, political, and now ethical theory. Lacan, like other poststructuralists, made the so-called linguistic turn and embraced the idea that language is not denotative. For Lacan, language does not directly denote or represent things as they really are. Instead, while it is relatively stable and meanings are widely enough shared for communication to function, language is actually self-referential and free floating. There is no exact or precise correspondence between words and the things those words refer to in the world. So although we have a sense of what is meant by words such as justice, fairness, rights, morality, and the like, these terms do not directly or perfectly, comprehensively or exhaustively, define or describe these concepts as they exist in the world.

As a concern for psychotherapy, the question is then, how do individuals function in a world where language, and our very sense of reality, lacks a foundation? Lacan frames the process of psychotherapy as largely focused on helping the patient recognize the corresponding patterns of understanding and behavior that are dysfunctional and to the construct alternatives that are more functional. Sociopolitically and administratively, the processes by which the patient becomes aware of and more capably navigates the world of unstable language and understanding are not dissimilar to the means administrators can more effectively work with citizens and communities in functional and stable ways.

From this perspective, Michael Harmon and O.C. McSwite (2011) argue that the key problem public administrators face is an ideology/world view that assumes stable denotative language and rationality on the part of actors in that world. These assumptions are increasingly under fire from administrative and other social theorists as no longer serving to provide a stable perceptual reality. For Harmon and McSwite, the failure of these assumptions are responsible for precluding the possibility of effective administrative action and also explain or describe the limits and tensions of traditional approaches to administrative theories of ethics that are derived from analytic philosophy.

The psychoanalytic alternative to modernist ethics proposed by Harmon and McSwite, as well as Thomas Catlaw and Gregory Jordan (2009), draws from Lacan, as well as Carl Jung, and is informed by neo-pragmatists like Richard Rorty and American pragmatists like John Dewey and Mary Parker Follett. This form of ethical theory relies on relationship and discourse rather than principle or calculative reasoning. In the absence of language that directly represents the real world, it is a robust and authentic relationship that enables ethical choice and is the basis of human action, creativity, and original action of all forms. Relationship is the source from which choice and corresponding action can be brought into the structured, social world, be that the organization or the political community.

## Conclusion

The study and practice of public administration has long been concerned with normative or value questions such as the legitimacy question, since its founding. Ethical questions of how to act and how to treat citizens are similarly central to public administration, and the ethical theories of administration that endeavor to answer them are critical to maintaining public trust and functional, equitable governing organizations. While no single ethical theory currently available resolves all potential ethical issues, the importance of ensuring, or at least enhancing, ethical behavior is built into the very structure, practice, and even political culture of American public administration. Ethical theorists working form both analytic and continental traditions continue to extend both administrative theories of ethics and corresponding ethical practices.

# Adverse Action

Jessica L. DeShazo
California State University, Los Angeles, CA, USA

## Synonyms

Employee discipline; Retaliation

## Definition

There are two definitions of adverse actions. The first definition is broad and refers generally to formal discipline of an employee. The second definition that is used by the US Equal Employment Opportunity Commission is narrower. It refers to an action that attempts to prevent an employee from opposing a discriminatory practice or participating in a discrimination proceeding. In the first definition, the adverse action has a negative impact on the employee's job, but the negative impact can be justifiable by the employee's misconduct and/or unacceptable performance. In the second definition, the negative impact is unjustifiable and is retaliation against the employee.

## Introduction

The words adverse action can be used in reference to a variety of situations including employee retaliation cases, discrimination cases, and employee discipline. It is important to first understand the context of the situation in which adverse action is being used. The context provides information about the types of adverse action that are legal as well as the rights and protections of employees. One situation entails formal discipline of employees who violate an organization's policies, the law, or perform poorly in their job duties. The employees in this situation are being disciplined for either

misconduct or poor job performance. Another context is retaliation against employees who either bring charges of discrimination against an organization, participate in the discrimination case, claim the agency has violated their rights, or act as whistle-blowers against the agency. In order to be considered an adverse action in this context, it must be materially adverse. These types of actions include demoting an employee, probation or suspension, transferring an employee to another location, and salary reductions as well as denying a position to someone who meets all of the requirements to carry out the job. The employee must be able to prove that the action is materially adverse. The following discusses adverse action in each of the situations. It begins with employee discipline and then goes on to cases of discrimination and whistle-blowing.

## Employee Discipline and Adverse Action

Sometimes, an employee must face disciplinary action. When an employee does not follow an organization's policies and procedures, the law, or when an employee performs poorly, they may be disciplined with adverse action. Usually, such action must fit with the nature of the employee's negative behavior or action because of employee rights. For example, if an employee comes to work late, they may receive a verbal or written warning for a first offense. However, they may face a written warning for a second offense. A third offense could be met with suspension. In most circumstances, they are not terminated. This is considered progressive disciplinary action, which is increasing the severity of a penalty for repeated offenses. If an employee is violent toward a coworker, they could be suspended or even terminated even if it was a first offense. The types of discipline that are allowed can be found in employee handbooks, union contracts, as well as government policies. Employees can be disciplined for both on-duty and off-duty actions. For example, a federal air traffic controller who is convicted of drinking with driving and is charged with a DUI can be placed on suspension and forced to enter a rehabilitation program as a condition of their continued employment with the Federal Aviation Administration. Employees can face disciplinary adverse action for off-duty actions and still be in violation of an organization's policies. Many organizations have open-ended lists of violations that include phrases such as "conviction of a crime" or "conduct unbecoming of a public employee" (Berman et al. 2013, 62).

Civil servants, public sector employees who are not part of the military, may have the right to challenge adverse actions. The ability to challenge adverse action helps to ensure that decisions are made based on the inability of the employee to carry out their job and act accordingly. Probationary and exempt employees are considered to be "at-will" employees and do not have the right to challenge adverse actions. Nonexempt civil servants can face an adverse action, but the agency must be able to provide a cause for the action. They have procedural due process rights. Public sector employees must be given notification and a hearing when an employer terminates their employment or adversely impacts their employment status.

When an employer gives an employee a disciplinary measure, the reason should be well documented, and the employee must understand why such adverse action is taking place. The employer must also communicate with the employee the necessary corrective measures to improve their conduct or performance. Employers cannot treat employees unfairly, and they must treat all employees equally. The disciplinary action must be based on the employee's performance or conduct and not on the employee's personality. Some unionized employees may have disciplinary standards outlined as part of their bargaining contract. Often, this provides greater job security, and it is meant to minimize managerial discretion and unfair disciplinary action. Employees in covered positions may be able to file a grievance if they believe they are being discriminated against. If the employee is part of a union, the union typically represents the employee in the grievance process (Kearney and Mareschal 2014).

## Discrimination Cases and Adverse Action

Public sector employees must be treated equally. An employer cannot give harsher punishments to some employees for the same infractions as other employees. An adverse action can be discriminatory if an employee is receiving a harsher punishment than their coworkers for the same negative behavior or actions. In this case, the adverse action is illegal and considered discrimination. Discrimination can also take place against protected group. For example, Title VII of the Civil Rights Act protects against discrimination on the basis of race, color, religion, national origin, and sex. The prevention of discrimination on the basis of age is covered under the Age Discrimination in Employment Act. States have provided protection to more groups of people on the basis of sexual orientation and gender identification. Protections also exist for genetic information as well as personal disability. Additionally, if the employee files a claim of discrimination or testifies in a discrimination case, the employer cannot retaliate. Such retaliation would be considered adverse action as well. Title VII of the Civil Rights Act of 1964 and a Supreme Court ruling are important in determining what is considered to be retaliation. The burden of proof is on the employee to show that the action would have dissuaded a reasonable person; this is called materially adverse. In this context, the employer's motive is important. The Equal Employment Opportunity Commission further explains that "stray negative comments in an otherwise positive or neutral evaluation, snubbing a colleague, or negative comments that are justified by an employee's poor work performance or history" are not considered adverse actions (Equal Employment Opportunity Commission website).

## Whistle-Blowing and Adverse Action

Whistle-blowing is when an employee discloses their employer's wrongdoing. Not all instances of whistle-blowing involve discrimination. The employee can disclose acts of discrimination or other unlawful acts such as wasteful spending of public funds. There is a different set of laws that protect employees who act as whistle-blowers than those who protect them against discrimination. These are the whistle-blower statutes that protect the free speech of employees. For example, the federal government has the Whistleblower Protection Act. Each state has its own set of laws governing what type of whistle-blowing activity is protected for state employees. If an employee engages in whistle-blowing and then faces an adverse action, the employer's motive is suspect. In many instances, the adverse action can be seen as retaliation because the employee acted as a whistle-blower. However, it is up to the employee to prove that the action was retaliatory.

There are limitations on the protections provided to public employees to act as whistle-blowers. The US Supreme Court decided that an employee can be formally disciplined for contents in an official memorandum pursuant to their work duties even when the information is a matter of public concern (Garcetti v. Ceballos 2006). The issue is a matter for the courts to decide. The case of Garcetti v. Ceballos modified the previous ruling for Pickering v. Board of Education (1968) when the court ruled if contents of a public employee's communication were a matter of public concern, they could not face adverse action from their employer.

## Conclusion

Determining whether an adverse action is legal or not is dependent upon the context. If the adverse action is disciplinary due to misconduct or poor performance, it can be legal. However, some employees have due process rights. An adverse action can be considered retaliation, and therefore illegal, in some instances when cases of discrimination and whistle-blowing are involved. In these instances, the employee must support the claim that action was retaliatory.

In public sector human resource management and personnel administration, it is important to

understand adverse action. Employees have rights that cannot be infringed upon.

# Advocacy and Policy Influence

John G. McNutt
University of Delaware, Newark, DE, USA

## Synonyms

Activism; Government relations; Interest groups; Lobbying; Policy practice; Practical politics

## Definition

Advocacy and policymaking refer to the actions of nonprofit organizations to affect public policy deliberations.

A major function of the nonprofit sector is the defense of the poor, the dispossessed, and the powerless (Jenkins 2006). Over the history of the sector, strides in human right and social justice have been attained by nonprofit organizations working for social betterment. Labor legislation, children's rights, social welfare legislation, environmental protection, and a host of other progressive policies are due to the product of nonprofit advocacy. In addition, the sector's fortunes are often determined by public policy and the mood of the political system. For both of these reasons, nonprofit advocacy is essential to the sector and an important ingredient of third sector activity.

## Why Nonprofits Advocate

The largest part of the incorporated nonprofit sector in the United States is health and human service organizations such as hospitals, clinics, social service organizations, mental health organizations, and so forth. Much of the funding for this component of the sector is from government allocations, grants, contracts, and insurance payments. This makes these organizations highly depend on this type of support and to the government policies that make it possible. Tax treatment is another area where government policy is critical. Loss of tax exempt status can be very damaging to a nonprofit but, as McLaughlin (2016), is a rare occurrence. There are also a large variety of other issues that can affect the sector directly. All of these reasons create a need for policy intervention on behalf of nonprofits. Nonprofits are regulated or controlled in many societies throughout the world, a situation that makes policy advocacy essential for many nonprofit organizations.

In addition, there are issues that affect social situations that the nonprofit sector is concerned with the rights of children, vulnerable adults, refugees, victims of war and violence, health and disease, civil rights, and a host of other issues that the sector cares deeply about. Some nonprofits address a range of issues, while others address a single issue.

These motivations often coincide. Service agencies are concerned about their funding and survival but the fate of those they serve is also important. A threat to one is a threat to both. Many organizations, regardless of sector, attempt to intervene in the political process. Businesses have government relations programs, and business groups, such as the Chamber of Commerce,

are effective advocates for business interests. Government organizations have legislative liaisons that work directly with other parts of the government, and governmental agencies often belong to coalitions of governmental units.

It is useful to divide nonprofits into those whose principle function is service delivery and those that are primarily advocacy or social change organizations. The latter are often called advocacy organizations, interest groups, or social movement organizations. Some nonprofits are a mix of both. Both service and advocacy organizations can be divided into formally incorporated organizations and associations that are not formally incorporated. It is important to note that political parties, political action committees, and similar organizations are nonprofits. The regulations that govern these organizations are different than those that govern other types of nonprofit organizations.

Larger nonprofit service organizations often have a government relations department that centralizes advocacy activities in one place and that may correspond to a board committee that oversees that function. Smaller organizations might have an internal government relations person or a contract lobbyist. Some organizations use the executive director or a board member as their government relations voice. Finally, some organizations are represented by a national or state group or a coalition. These organizational strategies are often used in combination.

Dedicated advocacy organizations typically have more substantial advocacy capacity. Many are often smaller organizations (when compared to service provider organizations), but the ratio of advocates to service providers is higher. They may have a broad range of interventions or may specialize in a single intervention. Research organizations and public interest law firms are examples of the latter. Advocacy organizations vary in the number of issues addressed.

Unincorporated voluntary associations will hire advocates or depend on members to advocate. These occasionally become formally incorporated organizations as the need arises. The need to expand means hiring staff, which requires a physical presence and fundraising. This creates a need for incorporation.

As technology develops potential for online advocacy groups emerges. This might allow voluntary associations to come to scale without incorporation or the establishment of a bricks and mortar nonprofit (McNutt et al. 2015). If the growth of virtual associations becomes common practice, it may shift the balance of the advocacy group community toward voluntary associations. Coupled with this emergence of leaderless organizations (Brainard et al. 2012; Earl and Kimport 2011) and what is essentially sole practitioner advocacy via technology, the future of advocacy organizations could be interesting.

Nonprofit advocacy is regulated in many parts of the world. In totalitarian states it may be completely prohibited (see the chapter on ▶ Dictatorships and Nonprofit Organizations). In the United States, certain types of advocacy are regulated by state and federal entities (Irvin 2005). The Internal Revenue Service regulates lobbying and partisan political activity. States regulate nonprofits as well and some go beyond what federal rules require. Those nonprofits that operate in the realm of partisan politics (such as 501 (c) 4 s and Political Action Committees) have other agencies to contend with, such as federal and state election agencies. Some aspects of advocacy are almost never regulated.

Membership: Some advocacy organizations have members, while others do not. Berry (1977) argued that the transition from membership-driven organizations to staff-driven organizations (where membership, if any, had a minor role) began in the 1960s and led to the rise of public interest groups. In some organizations, members have a marginal role often referred to as "checkbook members." The staff led advocacy that resulted tied professional advocates with fundraisers. This is part of the professionalization of politics that includes emphasis on message control, professional political operatives, and direct mail fundraising. This approach has been criticized by social scientists because it destroys the capacity of advocacy organizations to develop the civic skills that are needed to build social capital (Skocpol 2003).

Advocacy Methodology: Advocates use a set of well-understood and tested tools that have

evolved over decades of use. Organizations typically use a mix of these strategies, although some specialize in one strategy or another.

*Lobbying*. Lobbying means contacting government officials to influence them to make a decision in a certain direction. This can be inside or outside lobbying and direct or grassroots lobbying and includes techniques such as letter writing/e-mail/phone campaigns, nonprofit days, and a host of related techniques (Libby 2011). Lobbying is regulated by the IRS and by many states. Lobbying is done by organizational staff, grassroots groups, volunteers, members, and lobbying firms.

*Policy Research*. Information is critical to any advocacy effort. Policy research is conducted to document social problems or support potential policy choices. Many agencies do research to support their advocacy activities, and some do research to support other organizations who advocate more directly.

*Election-Related Activities*. There are a range of nonprofit advocacy activities that can support elections. Not all nonprofits participate in partisan political activity. While some nonprofits are barred from partisan political activity, others choose not to participate because of potential consequences. On balance, political parties, political action committees, and other similar nonprofit entities are completely involved in partisan politics.

Nonpartisan voter education is conducted frequently by nonprofit organizations and may consist of candidate forums, voter information, and discussions. Voter registration campaigns are also frequently conducted by community-based organizations. Nonpartisan get-out-the-vote efforts can also be conducted by a range of nonprofits and use techniques such as door-to-door canvass efforts, telephone and e-mail campaigns, voting day transportation, and leaflet distribution (Green and Gerber 2015).

Some nonprofits can directly support candidates. This is particularly true of political action committees and political parties. Some of this is paid for with the "dark money" provided by anonymous donors. In the wake of Supreme Court decisions such as *Citizen's United v. FEC* (130 S.Ct. 876) and *McCutcheon v. FEC* (134 S. Ct. 1434), this use of nonprofits has become more controversial. On balance, nonprofits can form their own political action committees. Professional and labor associations, business groups, and other types of advocates often form PACs to support their advocacy efforts.

*Lawsuits and Legal Action*. The use of lawsuits and legal action to change policy is a well-established strategy for nonprofit advocates, particularly in the environmental arena. A variety of legal strategies are available and legal action is often used with other strategies to affect change. Legal action is expensive and significant funding is often needed. Using a legal strategy may be disempowering to community members who see their fate in the hands of a lawyer.

*Administrative Advocacy.* Some lobbying is done directly with agency heads and this is generally considered administrative advocacy. Also relevant is intervention in the rule-making process. When a law is passed, one agency is usually tasked with creating regulations to implement the law. These regulations are created via a comment and review process that allows advocates to make their voices heard. Most experienced advocates know that legislative victories can be undone by implementation efforts.

*Community Organizing*. Organizing communities is a time-honored nonprofit advocacy tool that allows organizations to bring people to the decision-making process. Efforts in this vein often run from low-level activities that do not confront power directly to demonstrations and civil disobedience. Social movement organizations and community-based nonprofits have historically favored this type of approach. Most of these activities involve door-to-door or street organizing, community meetings, and a range of related techniques. They tend to depend on a large number of volunteers and incur considerable transaction costs.

*Electronic Techniques*. The growth of technology has created a revolution in nonprofit advocacy. In the 1980s and 1990s, activists were beginning to use a range of early techniques to facilitate their work. Early networks like Peacenet and Earthnet allowed communication. As personal technology became available and the

Internet evolved, the use by activists and advocates began to expand. Technology is an expected tool in advocacy campaigns throughout the world. The rise of Web 2.0/social media has revolutionized campaigning and undercut the assumptions that have prevailed in earlier periods. Technology tools that have been developed specifically for advocacy are widely available. The growth of data science and predictive analytics offers the possibility for substantial improvement in advocacy practice. One area is in the personalization of advocacy messages. Instead of providing messages that can appeal to everyone, we can narrow cast requests that deal specifically with the individual's concerns.

While these tools have been presented as discrete categories, they are frequently used together, either in sequence or at the same time. They might be considered ingredients of a larger strategy to attain a goal.

## Controversial Issues

There are a number of issues that confront nonprofit advocacy and policymaking. Some are philosophical issues, while others deal with the techniques that make the process work.

Who participates? Political participation is built on the idea that people have the opportunity to participate in the decisions that affect them. Advocacy groups are often controlled by professionals who make the decisions about efforts without recourse to people who are affected. This, at least to an extent, raises as substantial ethical issue. Research demonstrates that less affluent, less educated citizens participate at a lower level than their wealthier, better educated brethren (Verba et al. 1995).

Money and Politics: The growth of large donor politics means that control of the political system is influenced by those who have and are willing to spend a great deal of money. Advocates for the nonprofit sector often find themselves in pitched battles against well-funded interests. While innovations like Internet fundraising will redress this situation to some extent, campaign finance reform might be the real solution.

Resistance to Advocacy: Many nonprofits are reluctant to engage in advocacy (Berry and Arons 2002; Bass et al. 2007). Some feel that it is unprofessional. Others fear retaliation from government or political leaders. Still others think that it is a violation of their nonprofit status. While the last point might be true, it also might be that not all nonprofits fully understand what they are allowed by applicable law.

Astroturf: The creation of synthetic participation in political campaigns is called *Astroturf* (McNutt and Boland 2007). Typically, public relations consultants can create a fictitious organization that appears to take a position that agrees with their sponsor. This is often difficult to detect and can greatly complicate the role of decision-makers who must respond to all legitimate parties.

## Conclusion

Nonprofit advocacy has a healthy future. The need to engage the political system will continue as government continues to shrink and the nonprofit and commercial sector occupy the space that was once part of the public sector. The growth of money in politics will make this more difficult for many advocates, especially those who deal with less well-funded groups.

Technology is likely to revolutionize much of the practice of advocacy. Developments in data use, communications, and fundraising are likely to engender these new vistas. Some of the developments from the civic technology movement are likely to create a re-envisioning of nonprofit government relations.

New developments in the social sciences offer an array of possibilities to improve the effectiveness of nonprofit advocates. Data science opens the door to a wide range of new ways to understand social issues and to appreciate the advocacy environment. This can offer exciting new ways for nonprofit advocates to be effective. The growth of experimental political science (Green and Gerber 2015) also provides new insights into traditional and emerging techniques.

The cultural issue of resistance to advocacy is another serious barrier. Some of this is based on

the reality that politics is a hard place and that people and organizations get hurt there. Others are resistant because they misunderstand what is legally permissible. On balance, the business, the professions, and even the public sector understand that their options depend on the political system and advocacy is often richly rewarded when it is successful.

# Advocacy Coalition Framework and the US Immigration Policy

Geiguen Shin
School of Public Affairs and Administration, Rutgers University-Newark, Newark, NJ, USA

## Synonyms

Advocacy coalition framework; Policy change; Policy process

Like other policy issues, political beliefs on immigration policy are not always uniform or consistent over time. Instead, some exogenous occasions such as the 9/11 and the USA occupation of Iraq have caused a dramatic change in immigration policy. Thus, both long-term stable changes and short-term major policy changes have coexisted within the immigration policy at least in the USA; if so, what has caused the short-term major policy change in immigration policy in the USA? Based on the Advocacy Coalition Framework (hereafter, ACF), which was first developed by Sabatier and Jenkins-Smith (1993), policy change in the USA is caused by various resources, power competitions, unexpected accidents or shocks inside and outside of the subsystems. The ACF has become a comprehensive theory by emphasizing the need to take a long-term view of policy change and to deal with policy subsystems as the primary unit of analysis (Burton 2006). In particular, many researchers

discuss the interplay between external shocks and conditions of the internal subsystem in fostering policy change. Thus, the ACF provides a comprehensive understanding of changes in US immigration policy.

## Advocacy Coalition Framework

The ACF is a policy theory that explains policy change caused by both competition within the subsystem and stable and dynamic events outside the policy subsystem. Based on the version after 1999, the ACF as an alternative to the stages heuristic explains the significant policy change through the interaction between two or more different coalitions within a specific policy subsystem. Sabatier defines the policy subsystem as a network of individuals from a variety of public and private sectors who are involved in the maintenance and evolution of policy in a specialized area. Within the subsystems, individuals are clustered into competing advocacy coalitions that have the different beliefs and policy positions (Wildavsky 1962; Sabatier 2007).

The ACF argues that policy change is best viewed as a change or a modification of a certain coalition's beliefs over time. Within each advocacy coalition, their beliefs work as a glue that holds each coalition together. The ACF conceptualizes three different levels of beliefs: deep core, policy core, and secondary. *Deep core beliefs* are the critical normative beliefs of the members. *Policy core beliefs* represent applications for achieving deep core beliefs and are subsystem-wide in scope. *Secondary beliefs* are relatively narrow in scope and include more detailed instrumental decisions. Unlike deep core and policy core beliefs, which are more resistant to change, secondary beliefs remain more open to change as new information and pressures provide the opportunity to alter such beliefs.

The goal of each coalition is to change policies based upon their beliefs and preferences. Therefore, policy decisions are based upon the consensus between coalitions and can alter policies. In particular, the ACF suggests several sources that may cause both stable and major policy change. First, ACF involves two sets of external elements – stable parameters and dynamic events – that affect the constraints and resources available to subsystem actors over time. Stable parameters include basic constitutional rules, sociocultural values, and natural resources. These stable parameters make policies resistant to change over time. In contrast, dynamic elements include fluctuating events such as economic dislocation, changes in public opinion, and shifts in the make-up of the ruling coalition. These events often affect policy change relatively quickly over a short time and are a necessary condition for major policy change (Sabatier 2007). Second, policy knowledge has an effect on policy change via policy-oriented learning (James and Jorgensen 2009). Because coalitions consistently acquire policy knowledge through social, economic, political analyses and other forums, policy knowledge disseminated through policy-oriented learning can alter the beliefs of members. Policy-oriented learning may additionally work to change the secondary beliefs because the relatively narrow scope of such beliefs requires less evidence than core beliefs (Sabatier 2007). Thus, policy-oriented learning works as a catalyst for changing the beliefs of the coalitions across the policy process over time. Figure 1 presents the basic logic of ACF.

## ACF to Immigration Policies: Security Versus Economy

The ACF addresses the random nature of policy processes in practice. While the stages heuristic model assumes that the policy process works along the sequential stages, the ACF supposes that the policies are formulated and changed in unexpected and complicated environments. That is, the ACF is not constrained by a very legalistic and top-down focus as in the stages heuristic. The ACF as a theoretical tool that accounts for dynamic policy change or stability can be applied to complex, wicked, and seriously polarized immigration policy issues. Wong (2006) suggests that each policy group within the policy subsystem takes different stances on immigration policy-making. Scholars of migration studies

**Advocacy Coalition Framework and the US Immigration Policy, Fig. 1** The basic logic of Advocacy Coalition Framework. (Source: Sabatier and Weible (2007))

suggest that the expansive immigration policy, which is based on economic logic, increases the number of immigrants, thereby stabilizing labor supply in the domestic market and increasing economic performance (Tichenor 2002). On the contrary, a particular ethnic group which focuses on representing the concerns or interests of native-born Americans is more interested in increasing societal security than economic benefit and thus it tends to take a negative position on immigration policy.

Over the past quarter-century, the national stance on immigrants has been back and forth between more liberal and more conservative immigration policies. For instance, the most radical shift in the national immigration policy was the enactment of the Immigration and Nationality Act Amendment of 1965, which abolished immigration preference categories. Later, the national government shifted back to more restrictive immigration policies as shown in the enactments of the Immigration Reform and Control Act in 1986 and the Illegal Immigration Reform and Immigrant Responsibility Act in 1996. The aftermath of the September 11 attacks, the national government enacted even more restrictive laws to increase boarder security. For example, the Real ID Act of 2005 set forth higher federal standards for identification documents. The recent immigration law, the Deferred Action for Childhood Arrivals (DACA) Dream Act of 2012, indicates the changing national immigration policies to be more liberal. However, the Trump government has attempted to terminate the DACA program due to the concern about some negative perspectives of those undocumented immigrants who may not only deprive native-born Americans of jobs but push down wages (Alonso-Yoder 2018). Overall, the national government has sought to balance the inflow of immigrants, but

the numbers of those entering the country legally and illegally has been increasing exponentially.

The changing national stance on immigration issues indicates that there have been dynamic changes of immigration policies between what are advantages and disadvantages of immigration. Naturally, this raises one critical question: what have influenced some temporal changes of immigration policy to be either more expansive or more restrictive in the short run? Such rapid changes in the US immigration policy can be explained by looking at dynamic external events such as the 9/11 terrorist attacks and the increasing concerns about border insecurity. For instance, 9/11 made Americans abruptly change their image of immigrants who live in the USA from "good friends" to "risky enemies," with the concern of national security. In response to the mounting backlash against illegal immigration, the Trump government, as a means of enhancing national security, has made significant changes in national immigration policies during 2017 and 2018, including the construction of a wall along the US-Mexico border, the ban on admissions of nationals from eight Muslim countries, the termination of the DACA program, ending Temporary Protected Status for nationals of several countries, and deep cuts to refugee admissions (Pierce and Selee 2017).

However, the strict national security policy of the USA has faced strong criticism from the groups in the business sector, especially travel and tourism industries, and major allies of the USA like Eastern and Central European countries, and some Asian countries. The US government has been pressured to build more expansive immigration policy by such the pro-immigration groups as the US travel industry, the business community, and Department of State (Siskin 2007). These coalitions that believe that the economic growth is more important support more expansive immigration policy. The economic cohort that supports a strong economic impact of immigration suggest that increasing immigrants especially in high technology areas can improve human capital (e.g., Kerr and Lincoln 2010), and that immigration can lead to innovation (e.g., Akcigit et al. 2017).

## The US Visa Waiver Program and ACF

The US Visa Waiver Program (hereafter, VWP) is a good example that would explain the pattern of immigration policy changes. The VWP shows the polarized responses on the implementation of the program between policy actors and stakeholders. The case also creates two distinctive coalitions between the security-concerned group and the economy-concerned group. Since the VWP has specifically focused on changing number of visa waiver countries, the basic attention is given to the change of the secondary beliefs, which is more easily adjusted in the appearance of new information or changing strategic considerations.

The VWP was launched as a pilot program in 1986. It was designed not only to facilitate tourism by demanding no more than a passport from visitors but also to reduce the workload of State Department for foreigners who apply for a US visa. Initially, the VWP was allowed in only eight countries but was expanded to 27 in 2000. In 2007, the Congress and the Senate passed the reformed VWP, which added 12 more countries. Most recently, Secretary Napolitano at the Department of Homeland Security announced that Taiwan is included into the VWP as of November 1, 2012.

Over the years, the VWP has been under the center of tensions between security-concerned coalitions and economy-concerned coalitions. Despite of the striking confrontation between two different groups, stable external parameters influenced the federal government to limit the VWP. Stable external parameters that cause the policy change on the VWP could be explained by three compositions: (1) problems in the parameters in the national security, (2) social value on illegal immigrant issues, and (3) Legislative history and Acts. These stable parameters have driven the federal government to be resistant to expand VWP. Specifically, in the case of legislative history and acts on immigration, there have been some efforts to enact laws to limit visa issuance and VWP participation, to require stricter entry-exit controls for foreign students and exchange visitors, and to increase local police cooperation in the process of immigration policy

implementation. In 1996, Congress passed the Illegal Immigration Reform and Immigration Responsibility Act (IRAIRA), with "a provision (Section 110) requiring the Immigration and Naturalization Service (INS) to set up a database to track this information within two years" (Federation for American Immigration Reform 10/2011). After September 11, Congress again mandated the implementation of a computerized entry-exit database by 2005 (Federation for American Immigration Reform 10/2011). These congressional enactments significantly limited the entrance of temporary foreign visitors and were an obstacle to the expansion of VWP.

Dynamic external events regarding implementation of the VWP include (1) the impact of 9/11 terrorist attack, (2) increasing border insecurity connected with Mexican illegal immigrants and a perceived increase in illegal activity, and (3) the gradual decline of the number of travelers and tourists. The US Government Accountability Office (GAO) points out that "the VWP can pose risks to U.S. security, law enforcement, and immigration interests because some foreign citizens may exploit the program to enter the United States" (2006, p. 11). Another issue regarding dynamic external events on the VWP is concern about increasing border insecurity and related social problems connected with Mexican illegal immigrants. As a result, the increasing influx of illegal immigrants may bring about a feeling of a serious disorder in American social, economic, and national security systems. These problems have become major negative factors that would discourage policymakers who want to support the expansion of VWP.

However, economic decline in the business sector – especially the travel and tourism industries – has influenced policymakers to be more supportive to the VWP expansion. By the statistics from travel industries, the number of travelers seeking admission to the USA dropped about 17% during last 5 years. Friedman (2007) in Discover America Partnership says that travelers feel like a potential criminal while they engage in the process to enter into the USA. The strict national security policy of the USA has been criticized by the groups in the business sector, especially travel industries, and also the US allies in Eastern and Central Europe, along with some Asian countries. Indeed, the US allies have consistently pressured the national government to expand the VWP. This outer pressure has actually motivated the national policy makers to adequately respond to its allies by highlighting the point that international cooperation is an essential part of the US foreign policy (Carafano and Weitz 2005). The VWP was also supported by the US travel industry, the business community, and Department of State (DOS) (Siskin 2007), while it was strongly opposed by large anti-immigration policy action groups, communities, and research institutes, such as Minuteman, the Federation for American Immigration Reform, American Immigration Control Foundation, Families for a Secure America, American Congress for Truth, Pro English and Project USA. As a result, the external factors that would further increase substantial economic benefits in the USA and maintain reciprocity with its allies affected the expansion of the VWP. Table 1

**Advocacy Coalition Framework and the US Immigration Policy, Table 1** The belief systems between two coalitions on expanding the VWP

| | Security-concerned coalition | Economy-concerned coalition |
|---|---|---|
| Deep core beliefs | People's safety and nation's increased border security<br>Pessimistic for more tourism | Nation's economic growth<br>Optimistic for more tourism |
| Policy core beliefs | Government's more active defense of security and higher border control | Developing and increasing the competence of travel industry among nations |
| Secondary aspects | Keeping lower accessibility and strict control for immigrants, foreign-born people, and visitors to enter the nation<br>Ending the VWP, not expanding it | The least regulation for future travelers<br>Improving technical systems to check out foreign-born visitors and immigrants and expanding more visa-waiver countries |

presents different beliefs system between the security-concerned and the economic-concerned coalitions.

A successful consensus between two coalitions was made in a process of changing their secondary beliefs, which is most pliable to change in response to new information and events. The ACF predicts that policy-oriented learning can occur during the types of technical disputes over the administrative processes (Ellison 1998). Siskin (2007) points out that there exists the lack of information on aliens regarding the implementation of the VWP. Several hearings, forums, multiple rounds, professional analyses, and reports from political, economic, consular, commercial, and law enforcement officials could help two coalitions on the VWP by providing new information. For instance, the Senate Judiciary Committee's Terrorism, Technology, and Homeland Security Subcommittee through the hearing received the information that identifies some significant benefits and inherent risks of the VWP. One of the most influential information was from the report of the US Government Accountability Office (GAO). The GAO suggests that "the Office of International Enforcement officials attributed the lengthiness of the assessment process to the multiple rounds of clearances for each of the 25 assessments and the summary report" (The U.S. Government Accountability Office 2006, p. 20). Further, the economic-concerned coalition could mitigate a significant national security concern that the opposition coalition has raised. That is, it suggests that when the government waives the visa requirement for high-volume and low-risk countries, the cost and concentration of resources can be significantly reduced. As a result, the government can divert more of their own resources to control for the greater-risk nations (Siskin 2007). Overall, these policy-oriented learning processes provided a window of opportunity to change belief systems of the security-concerned coalition.

Additionally, policy brokers within the policy subsystem could help compromise two of the coalitions. Policy brokers on the VWP include INS, Department of Homeland Security (DHS), and the President. Particularly, President Bush actively worked with members of Congress based on security concern by suggesting that the USA should allow more foreigners to enter the USA without a visa on a temporary basis. Further, with dominant parties demanding to pursue the expansion of the VWP, the security-concerned coalition conditionally accepted its expansion by suggesting that the biometric requirement, as one of the safety requirements for desirable implementation of the VWP, should be fulfilled by countries which contain electronic data chips in the passport. Additionally, the security-concerned coalition asked the government to strengthen and improve efficiency, transparency, and reliability in the visa issuing and management process. Under these dynamic interactions and negotiations between two polarizing coalitions on the issue of the VWP expansion, two coalitions finally reached a mutual agreement. The mutual learning experience that professional and scientific information can better deal with the border security altered the secondary beliefs of the security-concerned coalition in the policy subsystem, which eventually influenced two coalitions to change more restrictive VWP to more expansive VWP.

## Conclusion

The ACF provides the capability to account for the process of complicated policy change on the immigration issues within the policy subsystem. Particularly, the Visa Waiver Program suggests three primary advantages of the ACF. First, the ACF clearly explains why and how two different coalitions – the security-based coalition and the economy-based coalition – underpinning the VWP subsystems have been formulated in a complex immigration policy. Second, the ACF explains the dynamic policy interaction between two coalitions through conflicts, negotiation, and persuasions. Third, the ACF identifies the impact of the policy-oriented learning on the policy process to discuss the expansion of the VWP.

Activism; Advocacy and policy influence; Interest groups; Lobbying; Practical politics

## Definition

The term advocacy refers to the attempt of actors to adopt strategies and tactics in order to influence decision makers and the public. As the policies of public or private organizations at the local, regional, or global level affect the lives of a variety of actors, they attempt to shape these policies to fit to their interest and demands. The term "actor" can designate either an individual (CEO of a company, Member of Parliament, journalist, etc.), a legal entity (a public agency, an enterprise, a trade union, etc.), or a social group (environmentalist, farmers, etc.). These actors try to influence policy process in terms of problem definition, policy formulation, implementation, or evaluation. Every individual or social group which can be affected from the existence or non-existence of a policy to solve a particular problem can be considered as a potential actor of this

policy field. Although all individuals have interests, not all of them take initiatives to influence policies which may have an impact upon them.

Advocacy groups are not the only participants to the policy process. Policy entrepreneurs, brokers, analysts, decision makers, interest groups, stakeholders, etc. are among others actors which shape the process. Most advocacy activity tends to be undertaken by organized actors rather than individuals although there are certain cases which prove that individual advocacy may have an impact on politics. For instance, Pakistani education advocate Malala Yousafzai who became the youngest person to win the Nobel Peace Prize at the age of 17 campaigned to change the policies of world leaders on education and women's rights. Despite the fact that social networks, global media coverage facilitated the possibility of an individual to make a change in public policies, most of the advocacy campaigns or movements are initiated by advocacy organizations. Malala Yousafzai continues her advocacy efforts with an advocacy organization called Malala Fund.

Thus, the unit of analysis to observe and examine advocacy activities is usually advocacy groups. Advocacy groups are important and perhaps central to the policy process because the power of individuals is greatly magnified when they form groups. These groups can be legal organizations working with salaried employees or informal organizations working with non-salaried volunteers. The important point is that all advocacy groups have a common interest as Olson (1971) argues that there is no group without a common interest.

Advocacy should be considered as a political act since actors or groups seek to influence other decision makers, elites, and the broader public. Exit or the threat to exit from the policy process is also considered as a form of advocacy although most actors or groups seek to exercise voice within a policy community. Advocacy can be realized through a variety of forms including persuasion, advising, participation, lobbying, mobilizing, networking, advertising, funding, forming coalitions, bargaining, campaigning, protests, unruly politics, sanctions, and threats.

Sometimes groups may advocate policies that promote the causes of others rather than pursuing their own interests. Advocacy groups may work on behalf of excluded groups in pursuit of citizenship rights, the public interest, or justice. Keck and Sikkink (1998) describe NGO advocacy as "plead[ing] the causes of others or defend[ing] a cause or proposition. . .[Advocacy groups] are organised to promote causes, principled ideas, and norms, and they often involve individuals advocating policy changes." Advocacy can also be performed to inform the targeted population about a policy which is planned or being implemented. Another function of advocacy is to provide expertise on a specific policy issue.

In liberal democratic countries, advocacy groups are usually seen as necessary and irrevocable elements of the policy process. The policies that shape the lives of citizens are usually formulated by a variety of advocacy groups competing with each other to influence policymakers, publics, or media. The literature on this topic documented hundreds of cases where advocacy actors have successfully influenced public policy and, in some cases, business policies (Keck and Sikkink 1998; Tarrow 1998). In most democratic countries, the number of advocacy groups is increasing at a growing pace. Berry (1997) characterizes this trend as the "advocacy explosion".

## Historical Development

Advocacy studies are strongly related with pluralism. Although pluralist theory is usually associated with United States, it has first emerged in the Great Britain. In the beginning of the twentieth century, British pluralists thought that traditional rights and liberties were under threat as there was a slide towards a state authoritarianism, and intermediate associations are thought as a bulwark against the expansion of the state. A leading figure of British pluralism Figgis argued that the authority of the state historically and legally did not override the rights of groups and associations. Such groupings according to Figgis generated a network of social relationships and linkages which sustained

individual identity and social integration (Hyman 1989). British pluralism was a challenge to the theory and practice of servile and monistic state and in that sense it was substantially different from conventional American pluralism.

The concept is borrowed by the conservative American political scientists after the Second World War to legitimatize the sociopolitical relations of the United States. On that account, as Nicholls (1974) argues political pluralism in Britain and in the United States has differed substantially in orientation and emphasis. Pluralism became the dominant school of thought in political science from the 1950s to the 1970s in the United States. The theory's basic premise is that the people who are adversely affected by a social condition or policy will organize and put pressure on the government to change the situation in their favor. Groups advocating policies affecting racial and ethnic minorities, women, consumers, individuals with disabilities, gays and lesbians, and the environment have been proliferated in the late 1960s, but their demands have been largely disregarded by government authorities. In contrast to theory's assumption that all interest groups have equal opportunity to influence decision makers, the discrimination against discriminated groups resulted with the demise of pluralism. The theory was criticized for being naive and complacent about deep inequalities that prevent some interests from getting adequate representation.

Today, most dominant theoretical models of policy analysis rely on American pluralism. For instance the model Kingdon (1995) proposes is highly pluralistic with a multitude of different centers of power in the legislative and executive branch and great number of advocacy groups struggling to place items on the political agenda. The political system is so fragmented that no single actor can dominate it and thus "a combination of people is required to bring an idea to policy fruition."

## Assumptions

The operation of advocacy groups in policy communities is dependent upon the existence of the following assumptions:

**Rational Individuals**: Advocacy groups operate in a society where human beings are characterized as autonomous, rational decision makers. Accordingly, all actors are behaving rationally when they join to advocacy groups in the sense that they care about the consequences of their own decisions and actions. This does not mean that individuals are able to anticipate and control all of the effects that stem from their own decision and actions. The same logic can be extended when advocacy groups come together to form advocacy coalitions. Thus, the logic of Olson's (1971) arguments regarding rational individuals considering membership in a group can be extended to organizations contemplating joining an alliance. Individuals or groups having their own objectives or preferences compare alternative ways of attaining their objectives, and they each choose the way that yields the most satisfaction. They maximize their self-interest through rational calculation. In that sense, the market model and the rational-making model are tightly related. Gerber (1999) argues that the behavior of advocacy organizations is analogous to that of firms. Advocacy groups weigh the costs and benefits of proposed actions just as firms do. Both firms and groups seek to maintain themselves and to reap profits. For firms, profits are monetary, whereas for groups, profits take the form of policy successes.

Borrowing from classic theories of firm behavior, it is suggested that people participate to advocacy groups because formal organizations reduce transactions costs by internalizing routine interactions (Williamson 1985). Individuals are much less efficient political actors when acting alone than as part of a group. Indeed, the sorts of collective action problem identified by Olson plague any efforts at political action that require the continued voluntary participation of individuals outside of a formal organization. Consequently, it is important to remember that advocacy organizations represent solutions to the collective action problem rather than manifestations of it. When a group is established, it reflects an effort to consolidate resources and reduce the challenges of voluntary coordinated political participation.

**Diverse and Open**: Advocacy groups operate in a political system which is diverse and open. The variety, independence penetrability, and heterogeneity of the various segments of decision-making bodies "guarantee that any dissatisfied group will find spokesmen in the political stratum." (Dahl 1961). The society is depicted "as fractured into congeries of hundreds of small special interest groups, with incompletely overlapping memberships, widely differing power bases, and multitude of techniques for exercising influence on decisions salient to them" (Polsby 1963). There are multiple centers of power that advocacy groups may try to influence and none of these centers is or can be wholly sovereign.

**Counterweighing Power**: As the centers of decision-making are diverse and pluralistic, so are the advocacy groups. On the assumption that in democratic countries power is significantly decentralized among a variety of political, professional, economic, social, cultural, and religious organizations, the existence of an advocacy group in one policy field is always matched by an alternative counter group. No single group is able to exercise exclusive control over more than one range of issues. That is, although a group may be influential in one "issue area," it cannot extend its influence to other areas (Schwarzmantel 1987).

The term countervailing power was firstly suggested by Galbraith to indicate that the exercise of one kind of power will give rise to organizations which counteract that power, for example, organization of buyers will emerge to counteract seller's organization. The multiplicity of groups prevents the domination of one single group. Coalitions between the groups are assumed to be flexible and impermanent, being formed on the basis of each new issue. Furthermore, different issues attract the attention of groups in different ways, so that many groups not in a present coalition are potential coalition partners on subsequent issues (Gamson 1972).

Although a situation of "perfect competition" is not entailed in pluralist theory, a rough equilibrium of power is assumed especially between the capital and labor. It is supposed that neither side has a privileged position and absolute dominance (Schwarzmantel 1987). Truman (1951) maintains that business groups are faced with the problem of internal cohesion, and this results in "significant differences in economic and political power." Dahl (1961) discovers a number of constraints on the power of economic notables such as their small number and disagreement among themselves. It is concluded that the authority of the business was mainly confined to business and they participated marginally in other policies.

**Overlapping Memberships**: As there are many advocacy groups in a particular policy field, members of these groups usually choose to participate to more than one group to promote their interests. Overlapping membership prevent the atomization of the society and to give it a sense of organism. It is assumed that through becoming a member of different associations, individuals will link themselves to different set of individuals and they will not be embraced or dominated by one of these associations. Advocacy groups coalesce and divide over policy proposals, depending on how they expect the proposal to affect them. Groups, which come together to fight a policy proposal, may longer wish to ally with the same groups for a different policy.

**Observable Interests**: The actions of advocacy groups and their influence on policy process are observable. In that respect, scholars take a behavioralist approach to observe actual conflict and cooperation between the groups. The emphasis on group behavior and group organization to understand policy-making is supported by an idealization of a civic culture in which a variety of advocacy groups participating, interacting, and competing for power and influence in decision-making. The classic explanation of power according to Dahl (1963) is the following: "A influences B to the extent that he gets B to do something that B would not otherwise do." He also argues that it is possible to measure A's influence by the extent or amount of the change in B's behavior from what it would have been."

The ability of groups acting alone or with other groups to in influence policy is not simply determined by using the most technically or rhetorically persuasive argument. The advocacy groups' power is determined on the basis of their

membership, ability to pool organizational resources, their prestige, credibility, expertise, strong administrative capacities, and political and media connections.

## Categorization

Advocacy efforts of actors are classified in the literature either on the forms of advocacy or on the type of group. Edwards and Hulme (1992) makes a distinction between two forms of advocacy: the first, which attempts to influence structures and ideologies, is a more systemic approach; the second, which attempts to influence specific policies and programs, is a more incremental one. However, the two approaches are not mutually exclusive and an organization can work at both levels. Advocacy groups' efforts to influence decision-making may also differ on the basis of the strategies that they use. Some groups use inside strategies to influence decision makers. Inside strategies usually involves direct contact with decision makers in the form of meetings, drafting legislation, or providing research. On the other hand, groups that use outside strategies prefer indirect forms of public pressure in the form of email, letter, or phone campaigns or getting media coverage of their cause.

In terms of actors, there are two broad categories of advocacy actors in policy process: *official actors* and *unofficial actors*. Official actors participate in public policy from the rights and obligations that are originated from legal regulations. The official actors which have responsibility in the decision-making process of a policy either at the legislative, executive, and judicial branches may involve in advocacy activities to persuade the public opinion. Unofficial actors refer to groups which involve in policy process without any explicit legal authority (or duty) to participate.

Official actors may prefer to organize some advocacy groups' interests and voices "in" and "out." They may block or keep at arm's length advocacy groups which they consider as marginal or non-negotiable. These groups are outsiders. On the other hand, insider groups are considered to be responsible in their expectations and willing to work with and through official actors. Insider groups are frequently consulted and they may develop routine and standardized patterns of interaction. A policy network may develop between insider groups and official actors.

## Groups in Advocacy Coalition Framework

Sabatier's advocacy coalition framework which gives a special importance to advocacy groups in policy formation also benefits from pluralism despite some methodological differences. Advocacy coalitions are an amalgamation of advocacy groups with shared beliefs that come together to influence policy process. These coalitions tend to consist of legislators, interest groups, public agencies, policy researchers, journalists, and indeed many other subnational actors who wield tremendous influence in the policy process (Sabatier and Jenkins-Smith 1999). So, although interest groups attempt to affect government policy whether at the local, regional, federal, or state level by articulating a position and putting pressure on decision makers, advocacy groups do not only seek to influence the public policies but also the policies of private companies, courts, NGO's, media, and broader public.

An advocacy coalition is a coalition of groups that come together based on a shared set of beliefs about a particular issue or problem. Sabatier, the originator of the advocacy coalition framework, develops a more elaborate approach than pluralism to explain how the groups come together despite their differences. He argues that groups will coalesce based on their more peripheral beliefs, provided that the coalition will advance their goals in the debate at hand.

Although most of these assumptions are in line with those of pluralism, there are certain differences. First of all, although in pluralism groups within the civil society such as interest groups, nongovernmental organizations come together to put pressure on the state organizations, in ACF, interest groups can act with public agencies to bring a certain cause to the agenda. Other actors or groups can be part of these coalitions such as

legislators, policy researchers, journalists, and other subnational actors (Sabatier and Jenkins-Smith 1999).

Second, advocacy coalition framework deviates from the rational model in the sense that it does not dictate that core policy belief systems operate on purely instrumental terms. The actor or the group's choice of action may stem from their ignorance or intuition, their emotions, or feelings. In that sense, ACF presumes that individuals are rationally motivated but are bounded by their imperfect cognitive ability to learn about, and comprehend, a complex world (Simon 1985). Having cognitive constraints, individuals are limited by their capacity to acquire and learn new information. Advocacy coalitions engage in what Sabatier (1988) described as "policy-oriented learning." Advocacy groups continually revise their beliefs in order to adapt to changes in the political and socioeconomic environment.

## Benefits of Advocacy Groups

Advocacy groups facilitate healthy political competition, the condition of a democratic public sphere. Advocacy groups perform the role of mediation between the individual and the state. As Almond and Verba (1972) suggest "through them the individual is able to relate himself effectively and meaningfully to the political system. These associations help him to avoid the dilemma of being either a parochial, cut off from political influence, or an isolated and powerless individual, manipulated and mobilized by the mass institutions of politics and government." The group bargaining process creates a barrier to extremism and provides a climate conducive to the formation of alliances.

Almond and Verba (1972) draw attention to the role of advocacy groups for the formation of democratic citizens. On the basis of their empirical research in five countries, they conclude that "[i]f the citizen is a member of some voluntary organization, he is involved in the broader social world but is less dependent upon and less controlled by his political system." Members of the advocacy groups, according to their findings are more prone to civic culture. The individual who belongs to a group, compared with one who does not, is more likely to feel competent to influence the government. Almond and Verba (1972) consider advocacy groups as small political systems and an individual who is a member of such an organization will gain the democratic skills by participating to its functioning and his/her competence vis-à-vis the political system will be enhanced. The activity of advocacy groups may have the following advantages:

1. Advocacy groups provide an essential freedom for citizens especially minorities particularly those connected with parties not in government to organize with like-minded individuals so that their views can be heard by others and taken into account by government.
2. They help disperse power downwards form central institutions and provide important checks against possible overpowerful legislature and executives. They act as buffers between the government and the people.
3. They provide functional representation according to occupation and belief.
4. They allow for continuity of representation, communication and consultation between government and public between elections, thus enhancing the degree of participation in the democratic system.
5. They provide detailed information on specific areas of economic and social activity. So they help to structure alternative policy choices.
6. People who are not necessarily active in political parties find an opportunity to participate in the policy process.
7. By concentrating on specific issues, the individual can join a group of genuinely like-minded people, can generally avoid the typical left/right ideological splits common in parties, and, moreover, may see more immediate policy results.
8. They represent marginalized interests that can find little voice in party politics and public opinion.
9. Advocacy groups provide venues where opinions are formed, voiced, and tested, where agendas are developed. Advocacy groups make significant contributions to the

public sphere by enacting a kind of communicative power that exists outside the state and market.

## Disadvantages of Advocacy Groups

Advocacy groups sometimes have bad connotations mainly due to the perception that some powerful or privileged groups dominate a specific policy field by blocking other groups to articulate their interests. When an advocacy group gets a law passed that benefits their group, the entire country may pay the costs. They may even use negative, divisive, and harmful social constructions of other advocacy groups. In order to promote their interests, advocacy groups may hide or distort crucial information during the formation phase of a policy. Interest advocacy is conducted by many groups that can be anti-democratic and illiberal in their ideals and functioning (Young 2000). Members of an advocacy group may view their access to a certain decision maker or source of information as a strategic advantage. They may not share such resources for not losing their competitive edge.

Despite the assumptions that any legitimate advocacy group will make itself heard at some stage in the process of decision, some groups may systematically excluded from policy venues. The power of some groups can be derived from the very organizational and institutional structure of a polity. There may even be some structural constraints on government to be more receptive to some interests. Similarly, political institutions may shape the formation and efficacy of interest groups. Even in advocacy coalition frameworks in which government agencies establish partnerships with NGO's, the relationship may not be on equal terms. As Gramsci pointed out, the state institutions may reinforce their hegemony on the civil society by supporting or empowering NGO's that support their policies. Not only institutions but also public policies affect interest groups. As Steven Lukes (1974) puts it, "A may exercise power over B by getting him to do what he does not want to do, but he also exercises power over him by influencing, shaping or determining his very wants. Indeed, is it not the supreme exercise of power to get another or others to have the desires you want them to have?" Lukes points out that scholars should take into structural power to analyze how the interests of advocacy groups are formed and shaped.

Collective action in most contemporary polities is such that the powerful and best resourced advocates tend to speak the loudest and have the most influence. As a result, public deliberation is often deprived of weaker and more marginalized perspectives. An advocacy group might oppose opening up a policy issue to public scrutiny, particularly if they benefit from the status quo or are accustomed to exerting coercive forms of power. Some of the interest groups may simply not want to engage with opponent groups or participate in a process that could marginalize their interests. More disadvantaged groups may fear co-option and prefer to fight injustice through more disruptive means such as protests, boycotts, or sit-ins.

Thus, advocacy group involvement in policy-making is not always synonymous with more or better democracy. Their ability to represent their constituency is constantly challenged, and their relationship to base organizations is often tenuous. Schattschneider (1960) remarked that the interest-group chorus in the United States sang in an upper-class accent. Skocpol (2003) concluded that associational life had become more elite and oligarchic and less participatory over time due to the proliferation of professional advocacy groups. According to Walker (1991), advocacy groups "depend heavily on philanthropic and, sometimes, government funding. Social movements and advocacy groups comprise only 20% of the major interest groups with a strong presence in Washington, DC"

## Conclusion

Public policy process requires reconciling conflicting points of view held by different groups and individuals outside government. Advocacy group activity will be part of the policy process as long as the political institutions have the capacity to address all possible alternatives to all possible problems that arise at any one time. Groups will compete and sometimes will form coalitions

with each other to determine the agenda and to propose their solutions to public problems. Advocacy group activity will also be observed in their attempt to keep issues off the agenda as such blocking action is as important as the affirmative act of attempting to gain attention (Cobb and Ross 1997). Thus, legitimate democratic governance is only possible in a participatory model of democracy which includes those who are affected by a particular in policy formation.

# Affirmative Action as Social Policy

Ester W. Stokes
Jackson State University, Jackson, MS, USA

## Definition

Adverse impact is when there is a substantially different rate of selection in hiring, promotion, or other employment decision which works to the

disadvantage of members of a race, sex, or ethnic group.

Affirmative action refers to proactive efforts on the part of an employer to address the effects of past discrimination when EEO efforts alone will not suffice.

The Civil Rights Act of 1875 (18 Stat. 335–337), sometimes called Enforcement Act or Force Act, was a United States federal law enacted during the Reconstruction Era that guaranteed African Americans equal treatment in public accommodations, public transportation, and prohibited exclusion from jury service. The Supreme Court ruled in 1883 that the act was unconstitutional.

The Civil Rights Act of 1964 (Title VII) prohibited employers and employment agencies from making employee and applicant personnel decisions based on race, color, religions, gender, or national origin and tasks the Equal Employment Opportunity Commission (EEOC) with enforcing the provision of the Act. The Act also prohibited discrimination in voting, public education, and accommodations in organizations with more than 15 employees.

The Civil Rights Act of 1991 is a United States statute that was passed in response to a series of United States Supreme Court decisions which limited the rights of employees who had sued their employers for discrimination.

Disparate impact prohibited employers from using a facially neutral employment practice that has an unjustified adverse impact on members of a protected class.

The Equal Employment Opportunity Act of 1972 mandated that state, local, and federal agencies adhere to the Civil Rights Act of 1964.

Equal opportunity refers to the treatment of all individuals in the employment process fair and equitably, regardless of race or gender.

Executive Order 10925 requires that government contractors take affirmative action to ensure that applicants are employed, and employees are treated during employment, without regard to their race, creed, color, or national origin.

Executive Order 11114 supplemented Executive Order 10925 declaring it is the policy of the United States to encourage by affirmative action the elimination of discrimination in employment.

Executive Order 11246 gave the Department of Labor the authority to enforce antidiscrimination policies among federal contractors under the Department's Office of Federal Contract Compliance Programs (OFCCP). The Executive Order prohibited discrimination by most employers providing goods and services to the federal government.

Social policy is the study of the causes of social problem and how government and society as a whole address issues of social welfare, individual well-being, and social justice.

## Introduction

The current scope of affirmation action programs is best understood as an outgrowth and continuation of our national effort to remedy subjugation of racial and ethnic minorities and of women. Although affirmative action is a contentious issued, the majority of Americans in our society agree that government has some kind of obligation to ensure racial equality, but that consensus breaks down in the specifics of implementation and social practice. While affirmative action, executive orders, and court rulings address racial discrimination and resulting inequities, as shown in *The Debate on Affirmative Action*, which is a collection of writing by the leading voices crucial to the dialogue on affirmative action, there is no consensus among scholars over the government's role in ensuring equality (Curry 1996).

First, this research provides an overview of the history of affirmative action in the United States and affirmative action as a social policy and concludes with an examination of the extent to which discrimination and exclusion of people of color continue to persist today.

## Social Policy

While public policy is concerned with the policy process, social policy is with the content of the policy. The history of social policy efforts to remediate racial discrimination can be traced to the post-Civil War period. Ultimately, social

policy is a term applied to various areas of policy, usually within a governmental or political setting such as the welfare state and the study of social services. In the context of social services, there is an interest in people's living conditions, the processes which lead to the recognition of human needs and problems, and ways to address these needs and resolve these problems, and the impact which social services and social policies have on living conditions and society in general. Thus, social policy entails the study of societal problems as well as policy (Spiker 2008).

## Overview of Affirmative Action

The Civil Rights Act of 1866 provided for the equality of citizens of the United States in the enjoyment of civil rights and immunities, which meant that in all things civil, social, and political, all citizens without distinction of race or color should be equal. Similar to the Equal Protection Clause in the newly proposed Fourteenth Amendment, the Act deliberated on the need to provide reasonable protection to all persons in their constitutional rights of equality before the law, without distinction of race or color, or previous condition of slavery or involuntary servitude (see ► Civil Rights). However, this Act, the Emancipation Proclamation, the 13th Amendment, the 14th Amendment, the 15th Amendment, the Civil Rights Act of 1875, *Plessy v. Ferguson*, the 19th Amendment, *Brown v. Board of Education of Topeka*, *Kansas*, the Equal Pay Act, and other executive orders and court cases failed to secure the rights of African Americans.

Affirmative action (AA) is a product of the Civil Rights Movement of the 1960s that emerged to get America to honor its original contact that all people are created equal. Thus, the underlying motive for affirmative action is the Constitutional principle of equal opportunity, which holds that all persons have the right to equal access to self-development. In other words, persons with equal abilities should have equal opportunities (Rosado 1997).

Affirmative action policies are those in which an institution or organization actively engages in efforts to improve opportunities for historically excluded groups in American society, with a focus on employment and education. The term affirmative action originally emerged in United States law to allow regulatory agencies such as the National Labor Relations Board to require employers found violating employment policies to take "affirmative action" on behalf of the victim(s) of violations such as reinstatement or back pay (Chen 2009). However, in 1961, President John F. Kennedy became the first to utilize the term in Executive Order 10925. This executive order realized the government's intent to create equal opportunities for all qualified people. In June 1963, President Kennedy continued his policy of affirmative action by issuing Executive Order 11114. Through this order, all federal funds, such as grants, loans, unions, and employers who accepted taxpayer funds, and other forms of financial assistance to state and local governments were by mandate to comply to the government's policies on affirmative action in employment practices (Kelly and Dobbin 1998). The Civil Rights Commission describes it as encompassing any measure, beyond termination of a discriminatory practice, which permits the consideration of race, national origin, sex, or disability, along with other criteria and which is adopted to provide opportunities to a class of qualified individuals who have either historically or actually been denied opportunities, and to prevent the reoccurrence of discrimination in the future (Curry 1996).

President's Kennedy's executive order initial focus was on improving opportunities for African Americans in employment and education; however, the order also established the President's Committee on Equal Employment Opportunity (PCEEO), now known as the Equal Employment Opportunity Commission (EEOC). Executive Order 10925 did not advocate preferential treatment of affected groups. However, in order to correct inequities, especially in the areas of housing, education, and employment, steps were taken to ensure that those groups that historically had been excluded or given limited access to societal rewards were given an opportunity to catch up.

Kennedy's Executive Order was amended and superseded by Lyndon B. Johnson's Executive

Order 11246. The Office of Federal Contract Compliance Programs (OFCCP), under the Department of Labor, monitors requirements for all federal contractors and developed regulations to which these contractors must adhere. In addition, an official of the organization must be assigned responsibility for implementation of equal employment opportunity and the affirmative action program (Nash 1971).

A landmark piece of legislation, Title VII of the Civil Rights Act of 1964 indicated that the Act was not designed "to grant preferential treatment to any group because of race, color, religion, sex, or national origin." There is no requirement in Title VII that an employer maintains a racial balance in the workforce. On the contrary, any deliberate attempt to maintain a racial balance would involve a violation of Title VII, because maintaining such a balance would require an employer to hire or refuse to hire on the basis of race. The Act however did not provide criminal penalties for employers that discriminated, nor did the civil remedies established by the act include compensation for pain and suffering or punitive damages. Rather, the Act sought to establish a conciliation process by which victims would be restored to the situation they would have had in the absence of discrimination. To carry out the conciliation process, the EEOC acts as a facilitator between plaintiffs and private employers and also pressures violating employers to provide compensation, whether in the form of back pay or restitution. The EEOC also provides legal support for plaintiffs should the plaintiffs pursue their grievances in court.

Two important issues were challenges in the wake of the Civil Rights Act of 1964: (1) whether unintentional or structural discrimination constituted violation of the principle of equal opportunity and (2) the extent to which preferential treatment should be given to affected groups. These issues came to the forefront during the Johnson administration. President Johnson frames the concept underlying affirmative action, asserting that civil rights laws alone are not enough to remedy discrimination. His appeal was for a more active interpretation of affirmative action that would assure equality as a result. Thus, due to slow results, in 1966, the US Department of Labor began collecting employment records with breakdowns by race in order to evaluate hiring practices. As a result, in 1968, the Office of Federal Contract Compliance issued regulations which required, for the first time, that specific targets be set to evaluate the effects of affirmative action programs. The regulations required that contractors provide in detail specific steps to guarantee equal employment opportunity key to the problems and needs of minority groups, including, when there were deficiencies, the development of specific goals and timetables for the prompt achievement of full and equal employment opportunity. It was in these regulations and analogous measures by the Equal Employment Opportunity Commission (EEOC) that the debate over affirmative action quotas had its origins.

The affirmative action debate was further fueled in 1972 when the Secretary of Labor's Revised Order No. 4 landed on campus by way of directives from the Department of Health, Education, and Welfare. Its predecessor, Order No. 4, first promulgated in 1970, cast a wide net over American institutions of higher education, both public and private (Stanford Encyclopedia of Philosophy, http://plato.stanford.edu/entries/affirmative-action/), by extending to all contractors the basic apparatus of the construction industry "plans." The Order imposed a one-size-fits-all system of "underutilization analyses," "goals," and "timetables" on institutions that did business with the government. The utilization analysis statistically compared the proportion of employed women and minorities in organizations with the proportion of women and minorities in the regional workforce, deriving a measure of what the department called "disparate impact." In the absence of discrimination, it was assumed that these proportions would and should be roughly equal. In addition, these regulations provided an official and measurable basis for the preferential treatment of affected groups.

In contention was the nature of the "goals" and "timetables" imposed on every contractor by Revised Order No. 4. Weren't the "goals" tantamount to "quotas," requiring institutions to use racial or gender preferences in their selection processes (Ezorsky 1977)? However, affirmative

action did not require or even permit the use of gender or racial preferences although some believes that it does, and if it does not impose preference outright, at least it countenanced them (Goldman 1976). To critics, reverse discrimination exists when employers and schools favor women and blacks, hence creating the same injustice perpetrated by Jim Crow discrimination (Newton 1973; Eastland and Bennett 1979).

Affirmative action in American employment law has evolved through a series of governmental proclamations, court decrees, and voluntary programs instigated by employers in the public and private sectors. However, private employers who receive no public funding are not required to adopt affirmative action policies. Affirmative action policies are enforced by the entities adopting them if they are voluntary, while affirmative action policies required by government mandates can be enforced through the legal system. For federal contractors and subcontractors, affirmative action must be taken by covered employers to recruit and advance qualified minorities, women, persons with disabilities, and covered veterans.

Affirmative action procedures should be incorporated into the company's written personnel policies. Employers with written affirmative action programs must implement them, keep them on file, and update them annually. The Office of Federal Compliance Programs (OFCCP) oversees the administration of plans for private entities which are government contractors under either a construction or nonconstruction contract.

The EEOC was strengthened by the Equal Employment Opportunity Act of 1972, which enabled the Commission to file class action suits. Under the Carter administration, the *Uniform Guidelines on Employee Selection* established the "four-fifths rule." Under this theory, a violation of Title VII of the 1964 Civil Rights Act may be proven by showing that an employment practice or policy has a disproportionately adverse effect on members of the protected class as compared with nonmembers of the protected class (*EEOC v. Sambo's of Georgia*, *Inc*., 530 F. Supp. 86, 92 (N.D. Ga., 1981)). The disparate impact theory under Title VII prohibits employers from using a facially neutral employment practice that has an unjustified adverse impact on members of a protected class. A facially neutral employment practice is one that does not appear to be discriminatory on its face; rather it is one that is discriminatory in its application or effect (The Free Dictionary, http://legal-dictionary.thefreedictionary.com/Disparate+Impact)." Where a disparate impact is shown, the plaintiff can prevail without the necessity of showing intentional discrimination unless the defendant employer demonstrates that the practice or policy in question has a demonstrable relationship to the requirements of the job in question (*Griggs v. Duke Power Co*., 401 U.S. 424, 91 S. Ct. 849, 28 L. Ed. 2d 158 (1977). This is called a "business necessity" defense.

While disparate impact is a legal theory of liability under Title VII, adverse impact measures the effect an employment practice has on a class protected by Title VII. The four-fifth rule was significant in that it provided an explicit benchmark to determine disparate impact, which had been left vague in earlier US Department of Labor regulations.

The tide favoring affirmative action began to turn in the 1980s during the Reagan and Bush administrations. However, in an effort to fight the rollback of affirmative action, Congress passed the Civil Rights Act of 1991. However, despite such efforts, the mid-1990s saw affirmative action programs continue to be rolled back based on critic claims that it is a form of "reverse discrimination," meaning that by favoring minorities and women, it discriminated against white males. In addition, they argues that affirmative action sometimes prevented companies from hiring the best available worker and in so doing caused resentment toward minority workers on the job. Although criticism was abundant, in 1995, President Clinton acknowledged in a speech the need for affirmative action and reaffirmed the continuing existence of systematic discrimination in the United States.

## Affirmation Action as a Social Policy

Affirmative action is a social policy created to promote the welfare of minorities by supporting

the idea that individuals are all created equal and should not be judged by race or gender. In short, it tries to give minorities that have been at a disadvantage their whole life an opportunity to level the playing field by providing a broader context by which to measure a job applicant or prospective employee (Shapiro 1968).

Social policy generally refers to action taken by government to deal with social and economic distress and other problems of an urban-industrial society. More specifically, social policy has a variety of different but related goals which are to: (1) mitigate or abolish poverty, (2) provide for groups unable to survive without some form of assistance, (3) improve and humanize conditions of work, (4) grabble with the sanitary and hygienic problems resulting from technology and urbanization, (5) control and punish crime, and (6) establish surrogate structures for functions once performed by family, church, or the immediate community (Gord 1979). Examples of social welfare in the United States include Medicare, Medicaid, temporary assistance for needy families, food benefits, and section 8 housing assistance. Other programs, such as worker's compensation, unemployment insurance, and Social Security benefits, are also considered social welfare programs. Historically, government agencies tasked with addressing social ills and identifying solutions took it upon themselves to initiate and carry out social policy action plans. More recently, governments have changed their approaches to collaborate with other nongovernmental and quasi-governmental agencies including businesses, nonprofits, and even other governments to effect positive change (Gord 1979).

Modern social policy is usually understood as state programs and services that address economic inequality resulting from risks to income and are bureaucratically administered to specified groups of citizens in specified circumstances. Thus, scholars place social insurance programs at the center of social policy (Flora and Heidenheimer 1981). However, research on gender inequality, childcare, and the role of race in the incomplete development of American social policies has provided new conceptualizations of social policy in the United States.

As a social policy, affirmative action encourages favorable treatment of socially disadvantaged groups, in order to reverse historical trends of discrimination and to create equality of opportunity for qualified persons. In an effort to wipe out the legal sanction of discrimination, the 13th, 14th, and 15th Amendments, along with enabling legislation, were passed without controversy regardless how ethical the motive. However, unjustified discrimination has been, and remains, a major problem of American life (Lugg 1997), and scholars surmise that the dilemmas over how to respond to the problem raise some of the most profound and delicate questions of morality, politics, and law. At a moral level, the concern is about principles of social justice, liberty, and welfare. Legislation is passed followed by dissection and interpretation from the courts followed by even more legislation. And so has been the pattern of discourse around the topic of civil rights over the past 100 plus years (Greenawalt 1983).

The first civil rights bill was passed in 1866. Its most powerful effect was to overrule the *Dred Scott* decision by declaring that all persons who were born in the United States of America and were not a subject of any foreign powers were citizens of the United States. Afterward, the Fourteenth Amendment was passed to make certain that civil rights would be truly nationalized, that the federal government would inject itself into this realm that had hitherto been exclusively reserved to the states, and that all individuals would be protected in the full and equal enjoyment of the rights of person and property (Gressman 1952).

Despite the passage of post-Civil War, federal antidiscrimination legislation employment and educational opportunities were still not equal. Blacks, Hispanics, and native Americans continued to be disproportionately represented in the lower socioeconomic strata of society. In 1965 the Department of Labor published a monograph entitled *The Negro Family: The Case for National Action*, commonly referred to as the Moynihan Report which called for affirmative action designed to produce the group results required by the doctrine of equal opportunity based on the assumption of racial equality (Moynihan

1965). The architects of affirmative action were minority groups, politicians, and affirmative action "liberals" who were trying to implement the philosophy of distributive justice which asserts that equals be treated equally, precluding arbitrary distinctions based on irrelevant characteristics (Greenawalt 1983). The very act of discrimination on the basis of race violated the above-stated tenets of distributive justice, thus creating hostility and divisiveness within society. It could no longer be plausibly argued that such discrimination was necessary to avoid racial strife or further social policies.

The United States' commitment to nondiscrimination was broadly understood to encompass the eradication of intentional and overt discriminatory practices against minorities and the elimination of laws and legally sanctioned traditions and practices that resulted in government classification and legislation on the basis of race. The concept of a "color-blind society" was introduced and strongly supported, stating that racial categories would be both irrelevant and impermissible as classifications in law or policy (Sindler 1983). One of the reasons why such a principle of nondiscrimination has historically enjoyed and continues to be enjoyed is that broad public support is that racial neutrality is clear, limited, and closely tied to the traditional view of equal opportunity held by most Americans. Accordingly, the individual best able to perform the tasks required by the job is the obvious best choice. This view of equal opportunity is apparently "fair" by its very definition and operation, and yet, because of its highly individualistic nature, it fails to take into account the inherent inequity among groups by way of income, status, and past discrimination. In reality, however, what is often meant when discussing equal opportunity is something more than a fair chance to compete on the basis of one's present skills, namely, a claim that the government should afford minimally satisfactory, or equal, opportunities to develop talents and skills. In fact, from the start of the Kennedy Administration in 1961, federal officials pursued race-conscious affirmative action by applying government pressure to hire members of favored minority groups, justifying the action by reference either to an explicit charge or an implicit perception of discrimination, which was defined as racial imbalance in the work force (Greenawalt 1983).

It was assumed that once society behaved in a "color-blind" manner and removed racially discriminatory barriers, which would allow minorities to surge in the job market and gain the equality due them. However, this did not happen. Thus, government policymakers were forced to strengthen efforts at equalizing opportunity. Under the broad rubric of "affirmative action," the government stepped up efforts aimed not solely at ending discrimination but at remedying the effects of past discrimination. During the 1970s, these efforts transformed policy from nondiscrimination and equal opportunity for individuals as traditionally understood to racial preference and group proportional equality (Sindler 1983). It was at this point that various methods of affirmative action started to emerge. The traditional or nondiscriminatory affirmative action such as wide notice of job vacancies and active recruitment of minority persons continued; however, policies were introduced that was more aggressive and legitimate to increase minority participation although critics were of the opinion that such seemingly preferential policies stifled competition and committed what was to be known today as reverse discrimination against nonminorities (Sindler 1983). Hence, the 1970s not only witnessed heated controversy about the legal viability of affirmative action legislation from a constitutional perspective but also questioned the basic wisdom of using legislation as the vehicle to carry out social policy. There existed no judicial precedent to support or justify the innovative programs embodied in federal or state affirmative action legislation.

Affirmative action policies were based on a concept of compensatory justice which is the premise that persons who have suffered because they have been wrongly treated on the basis of some arbitrary characteristic may claim that those who wronged them should pay them back for the harm done. The two main arguments for favoring minorities and redressing underrepresentation are that preferences are needed to

place blacks and other minority groups in the position they would have had but for discrimination and that preferences serve the ideal of equal opportunity (Greenawalt 1983). If this premise is accepted, then a more aggressive form of affirmative action for groups of individuals which is more than just a color-blind racially neutral solution is defensible as an acceptable means to finally abolish the lingering consequences of historic discrimination (Sindler 1983). Therefore, it is this idea of statistical group parity which for a time became the alternate definition of equal opportunity which has raised the greatest claim of reverse discrimination.

The impetus to redefine equal opportunity to include group rights and equality of result accelerated with the start of Title VII enforcement in 1965. Ironically, this impetus for change came through the EEOC. The commissioners, staff, and clientele groups of the EEOC agreed that discrimination should be defined as patterns of social and economic disadvantage caused by employment practices and social institutions in general, in relation to which complaint processing and case-by-case litigation were irrelevant. Because of its inability to actually file suit in district court, the EEOC fell back on the practice of data gathering and holding public hearings at which patterns of discrimination were attacked. Although lacking substantive rule-making authority, EEOC advanced new principles of employment discrimination law through its power to make reasonable cause findings which could be pursued in the courts, issuing procedural regulations and filing of amicus briefs.

The OOFCP purposefully maintain a vague definition of contractors' affirmative action compliance, for by pushing a "result-oriented" agenda without being overly specific, it could avoid the ban on quotas posed by the "color-blind" wording of Title VII. It was pressure both from the civil rights lobby, which sought more rigorous enforcement of the contract obligation, and from critics of affirmative action, who sought to stop the trend toward race-conscious practices, which led the Johnson Administration to adopt "hard and fast" quotas instead of the strategy of coerced yet non-specific minority hiring.

Starting in the early 1960s, in reaction to civil rights campaigns in Philadelphia and elsewhere, the federal government used the wedge of contracting to require companies seeking its business to take affirmative action to assure the inclusion of African Americans among its employees. The policy took a new turn during the Johnson administration by targeting construction trades in key metropolitan areas for compliance, starting with St. Louis in 1966 and extending to Philadelphia the following year. Philadelphia garnered national attention from efforts to integrate historically white building trades (Gillette 2013). The Nixon administration held that it could require affirmative action plans going beyond the requirements of Title VII, provided they were aimed at the purposes of the law: eliminating discriminatory practices and promoting employment equality for blacks. Initiated by President Richard Nixon in 1969, the "Philadelphia Plan" was the most forceful federal affirmative action plan thus far to guarantee fair hiring practices in construction jobs. Philadelphia was selected as the test case because assistant secretary of labor Arthur Fletcher explained that craft unions and the construction industry are among the most egregious offenders against equal opportunity laws, openly hostile toward letting blacks into their closed circle. The order included definite goals and timetables. Pursuant to Nixon's assertion, the order did not impose quotas, but require federal contractors to show "affirmative action" to meet the goals of increasing minority employment.

Although Reagan had the power to unilaterally alter or abolish affirmative action programs, such was not done. The Reagan administration tried to limit its excesses and make it more politically and administratively palatable. It was under his leadership that the Justice Department embraced the theory of disparate impact. By the 1980s, the majority of corporations had institutionalized the concept of affirmative as part of the corporate culture, but the Reagan administration did little more than rationalize the use of affirmative action, thereby legitimizing and strengthening the underlying policy. Goals and timetables were justified as good for business for idealistic social reasons.

## Conclusion

Affirmative action cannot be understood in isolation of other major social problems. Hence, a more workable model of affirmative action may be more realistic based on individual need rather than on group traits such as race or color which are systemic problems, interconnected and interdependent on economical and political policies, and cultural values that legitimize inequality (Shogren 1998).

Is it socially justifiable to provide, through federal and/or state legislation, preferences to those individuals who have suffered unjustified and arbitrary discrimination in the past in order that those individuals may escape the effects of that discrimination which exist in the present? Courts today are skeptical of affirmative action as a remedy for past discrimination. Under both the Constitution's equal protection guarantee and Title VII of the Civil Rights Act of 1964, distinctions based on race are inherently suspect, whether such distinctions are burdensome as in the case of traditional discrimination or "benign" as in the case of affirmative action. Under the Constitution, courts must subject affirmative action programs to strict scrutiny. Accordingly, such programs cannot pass constitutional muster unless they serve a compelling interest and are narrowly tailored so that the identified interest is served with the least harm to those who have not suffered discrimination (Richardson 1998).

Yes, affirmative action is under attack; however, once established in legislation and administrative regulation, it takes a much greater force to remove the social policy than to allow it to remain. The current state of the law suggests that an affirmative action program will survive strict scrutiny if it is tied to the original purpose of social programs: remedying proven, not speculative, past, or present discrimination. The reality of situation is that the final arbiter of social policy is the Court as it interprets those statutes and policies in the name of judicial review.

Affirmative action is a social policy created to promote the welfare of minorities by supporting the idea that individuals are all created equal and should not be judged by race or gender. Therefore, minorities should be considered as a feasible choice for hire as a white male candidate, taking into consideration their qualifications.

## Affordable Housing Policy in Penang State of Malaysia

Kuan Heong Woo
School of Social Sciences, Universiti Sains Malaysia, George Town, Pulau Pinang, Malaysia

### Synonyms

Low-and-middle income housing; Low-cost housing; Public housing; Social housing

### Definition

Affordable housing refers to housing which part of the rent or cost is borne by the government to assist the middle or lower income households in obtaining and paying for appropriate housing without experiencing undue financial hardship.

### Introduction

Housing is one of the basic necessities of human. It is a fundamental right for everyone to have access to a safe and habitable home, and it is the responsibility and obligation of the government to guarantee adequate housing for its citizens (UN Habitat 2009). There is substantial evidence of a growing housing affordability problem in most urbanized cities. A recent report shows that cities housed more than half of the world population; however, there are only 13% of the world's cities have affordable housing (UN Habitat 2016), indicating the severity of shortages of affordable housing in urbans, especially in swelling cities. Therefore, unsurprisingly housing affordability remains a major concern worldwide and providing decent affordable housing remains one of the hardest policy challenges for many governments around the world.

Housing surely is a key socioeconomic agenda of most, if not all, governments in the world. Housing programs around the world have long measured housing affordability in terms of percentage of income. The most conventional of all housing affordability indicators presupposes that cost burden or affordable rent burden should no more than 30% of household's monthly income (Earl et al. 2017). Nonetheless, housing affordability is more than an income issue. This multidimensional concept is beyond cost and pricing (economic) but also includes environmental, social, and cultural aspects. Therefore, the motivation and debate for housing policy often swing between social (providing shelter) and economy (creating wealth). The policy choice between community and economy often come with conflicts. Tension and conflict would be heightened if housing affordability not only confined to economic matters but also to include the broader affordability of housing sustainability issues. These competing goals between economy, social, and environment have created a great challenge to most governments in juggling to meet the demand of those competing and sometimes conflicting goals in their housing policy. Like other cities that are experiencing urbanization, the state government of Penang in Malaysia is no exception in facing housing policy dilemma.

Penang is one of the 13 states of Malaysia. The state is dynamic and fast-growing. As one of the

The scope of the study is from 2008 until the Malaysian 14th General Elections which held on 9 May 2018, where Malaysia experienced its first time change of government at federal level since 1957.

This study is supported by Universiti Sains Malaysia (Grant no.: 1001/PSOSIAL/8016016).

most urbanized Malaysian states, development in Penang has been phenomenal, especially after the inscription of George Town (the capital of Penang) as a UNESCO World Heritage Site in 2008. The inscription has not only reinforced Penang on the world map but has also boosted the state's economy through tourism, foreign direct investment, and commercial developments. These developments come with prices, however. Conflicts over land use between industries, traffic, residences, and recreations are intense in the tiny state with an area of only 1046 square kilometers. As one of the most attractive states to invest and live in in Malaysia, Penang properties have a steady increase of nearly 10% a year in particular residential properties since 2008. House prices in Penang escalated. With a 6.32 median multiple housing affordability, Penang homes were categorized under the "severely unaffordable" category in 2016 (Yeap 2017). The situation was worsening when the Opposition-run state government was not at a good term with the Barisan National-run federal government. The then federal government was accused of taking a punitive attitude towards Penang, a state which was governed by political rival. (Penang was ruled by Pakatan Rakyat (PR) after the Malaysian 12th General Elections which held on 8 March 2008. PR is an informal Malaysian opposition political coalition formed on 1 April 2008.) Viewing from the scenario of hostile political environment between the then federal and state governments in addition to escalating property prices and land scarcity, therefore, developing affordable housing in Penang has been a constant challenge to the state government.

## Penang State's Own Brand of Affordable Housing

In Malaysia, affordable housing is a federal as well as a state matter. According to the Federal Constitution of Malaysia, at the federal level, the federal government is responsible in providing grants or loans and technical expertise to undertake the development of affordable housing, while at the state level, as land is a state matter, the state government is responsible in identifying suitable location for affordable housing project. It is also the responsibility of the federal government to formulate policies and guidelines for housing provision; whereas, state governments have to cooperate with federal government on the implementation of affordable housing project in their respective states.

However, knowing nothing much it can get from the then federal government, Penang state government has announced the launch of the Penang affordable homes scheme registration in 2013 and set up a MYR500 million Public and Affordable Housing Fund to build affordable and public housing in the state. This is the largest amount set aside by any state government in Malaysian history to build its own brand of affordable housing (Lim 2013). Generally, affordable housing scheme in Penang is mainly government-driven projects even though there are two ways of doing affordable homes, namely, by requirements of the state government to private developers and by the state itself. Initially, there were a total of 14 affordable housing projects (included are the projects of Teluk Kumbar, Pintasan Cecil, Jelutong, SP Chelliah, Sandiland, Perak Road, Bandar Cassia, Kampung Jawa, Ampang Jajar, Mak Mandin, Juru, Bukit Mertajam, Ujung Batu, and Kampung Main Road) are undertaken in all five districts of Penang by the state government. Three more projects (Kota Giam, Kepala Gajah, and Permatang Tok Subuh) were added to the list in 2016. These 17 affordable housing projects will deliver 27,230 units of various types of affordable housing for Penang people with different earning categories (Penang State Government 2017).

Since the launch of Penang state own brand of affordable housing, the issue has become an unending bone of contention between the Barisan Nasional-run federal government and the Opposition-run Penang state government then. Finger pointing at each other on issues related to affordable housing is not uncommon. Due to political hostility between both governments, disputes over affordable housing in Penang have never been resolved.

## Housing Affordability: Pricing

The rapid population growth in cities forces an unprecedented reorganization of their physical environment, including housing. Accessing to affordable housing remains a challenge for most countries in the world and this challenge is especially real in developing countries where a large portion of the population is unable to access to adequate and appropriate houses at the market price. In recent years, the world witnessed the increasing wealth disparity between the rich and the poor. This tension brought in by social inequalities has highlighted the importance of harmonious social relationships and sustainable development in housing system. Therefore, it is very important for the government to develop affordable housing that aiming at creating balanced society with a variety of housing at a variety of price points. A mix of (affordable) housing opportunities that shelters a demographically diverse population helps to create a sustainable community.

In its effort to control surging property prices, Penang state government has intervene and implement cooling measures to control the property market. Consistent with the concept of housing diversity builds great neighborhoods, and in addition to its effort to control house prices in order to create harmonious and sustainable society, the state government has designed and developed five types of affordable housing which cater for Penang people with different income levels. Type A and Type B affordable housing used to refer as social housing which termed as low-cost and low-medium cost housing. These two types of affordable housing have a minimum floor size of 650 square feet and are respectively capped at MYR42,000 (about USD10,468) and MYR72,500 (about USD18,069). (All calculations in this article were based on the currency exchange rate of 1.00 Malaysian Ringgit equal to 0.25 US Dollar as of 20 June 2018.) Type A affordable housing is meant for Penang people whose monthly household income is not more than MYR2,500 (about USD623), while Type B affordable housing is meant for those people whose monthly household income is not more than MYR3,500 (about USD872) separately. There are three types of Type C affordable housing, namely, Type C1 (750 square feet), Type C2 (750 square feet), and Type C3 (850 square feet) affordable housing where their prices are, respectively, capped at MYR150,000, MYR200,000, and MYR300,000 (about USD37,384, USD49,845, and USD74,768) which meant for those with monthly household incomes not more than MYR6,000, MYR8,000, and MYR10,000 (about USD1,495, USD1,993, and USD2,492) separately (Penang State Government 2016).

The cornerstone of a thriving community is housing for all. Affordable housing project that consists of a variety of housing opportunities with a coherent vision of diversity and affordability is the hallmark of a healthy and balanced community. Obviously, the effort of Penang state government in creating affordable housing system with a variety of price points is in tandem with the state government's housing motto of "1 Family, 1 House". With its determination in creating a supportive housing environment and expanding the availability of affordable housing to Penang families with different income levels, it is hoped that Penang will be heading toward a more healthy and balanced society.

## Broader Affordability Issues: Green Design and Community Living

As discussed earlier, housing affordability issues are more than cost and supply. A sustainable affordable housing development required the balanced pursuit of broader affordability concepts such as social inclusion, community living, green lifestyle, and sustainable design, among others. Therefore, in developing its affordable housing project, Penang state government has taken broader affordable concepts like green living, community living, and affordable living into its consideration. In this article, Hijau E-Konumiti – the pioneer and biggest affordable housing project of Penang state government – will be taken as example to show case the inclusion of the broader conceptualization of affordability of green design

and community living into the state's affordable housing system.

Hijau E-Komuniti is one of the largest master planned development projects in Penang. Hijau E-Komuniti will cover five parcels of land totalling 200 acres and will provide some 11,800 units of affordable residential units. These 11,800 units of affordable housing comprising 3372 low-medium cost apartments and 8428 medium-cost apartments to be built over 80.9 hectare to 59,000 residents once completed. It will be developed in five phases over a period of 10–15 years. The first phase of Hijau E-Komuniti called Suria comprises of 520 units of affordable housing has been completed in early 2018 and now is waiting for the Certificate of Completion and Compliance.

Consistent with the concept of eco-town, the development and overall planning of Hijau E-Komuniti is friendly to nature and is in harmony with the environment. To be in line with the green design concept, the Green Building Index (GBI) is followed. GBI is Malaysia's industry recognized green rating tool for buildings to promote sustainability in the built environment and raise awareness of these issues among relevant stakeholders such as developers, architects, and contractors. Six main criteria are used to assess residential properties including energy efficiency, indoor environment quality, sustainable site planning and management, materials and resources, water efficiency, and innovation. In line with its name "Hijau" (literally means "green"), this affordable housing project promises a green living environment. At least 20% open space is created within its area. Apart from that, recreational places such as international golf course, sport complex, water sport, theme park, Batu Kawan Stadium, as well as mangrove and bird sanctuary for eco-tourism, higher learning institutions, and Batu Kawan Industrial Park are situated within its vicinity (Penang Development Corporation 2014). The above features of Hijau E-Komuniti demonstrated that it is an affordable housing project that is consistent with principles of green approach and affordable living.

Besides green design, providing opportunity for meaningful community living is also one of the considerations in developing Hijau E-Komuniti. Social dimension is one of the significant components of sustainable housing development. Therefore, it is important to include the concept of community living in developing affordable housing in order to foster social inclusiveness and integration by putting in adequate infrastructure and sufficient public spaces to engage community. Enough open space and sport facilities have been put in in the state-driven affordable housing project. In addition to the 2-km green lung, cycling lanes, jogging tracks, other public space such as 3G Center (a center that meant for the young, adult and older generations), linear park, together with such sport facilities as basketball court and football field – which sounds a bit luxury for affordable housing project – are also provided in Hijau E-Komuniti. This indicates the state government's determination to materialize the community living concept in its affordable housing system through sport and other meaningful community engagement activities.

The concept of community living is also further strengthened through religious site design. In Malaysia, providing a *surau* (prayer room) in each building is one of the requirements for residential development. However, in Hijau E-Komuniti, *surau* is not provided in each phase of the project. A bigger mosque will be built instead. The notion of building a bigger mosque to replace separate *surau* is an effort to call residents of Hijau E-Komuniti to pray and meet at the mosque in order to create a sense of community among residents in the affordable housing system.

All the above design demonstrates that Penang state government has taken initiative to create quality public space in encouraging community living and green design in its own brand of affordable housing project.

## Conclusion

Even though there are still considerable challenges, Penang state government is trying its very best to adopt and implement policies and strategies which aim at making housing habitable, affordable, and accessible to Penang people. With its own brand of affordable housing, the state

government aims to increase and diversify the supply of affordable homes to Penang people from lower and middle strata groups with various income categories. While the household income affordability is the main concern, broader affordable issues like integrating housing with such functions as environmentally friendly and social integration are also been taken care in the state affordable housing policy.

A holistic housing approach that integrate human and nature determined the sustainability of affordable housing program. As demonstrated in the case of Hijau E-Komuniti, its development is complementarity between political and socio-economic systems, and the environment which aims to improve human well-being, nurtures social capital through encouragement, mutual understanding, and trust with little compromise on the viability of the environment.

Developing affordable housing is not an overnight job. Therefore, it is still too early to judge if Penang state government has failed or succeeded in having its own brand of affordable housing as the state's own affordable housing scheme is still considered at its infancy. However, there are early signs to indicate that the state government is trying to develop and build affordable housing that is decent and habitable to Penang people.

# African-American History Commission Act, 400 Years of

Veronica Adams-Cooper
History, Political Science and Public Administration Department, Albany State University, Albany, GA, USA

## Synonyms

400 Years of African-American History Commission Act of 2018; 400YAAHCA; Civil rights, slavery (enslavement); Pub.L. 115–102; Public Law No: 115–102; PL 115–102

## Definition

The federal law establishing a national commission charged with commemorating the 400th anniversary of the arrival of Africans at Point Comfort, Virginia, in 1619, and other purposes.

## Introduction

The 400 Years of African-American History Commission Act, referred to as the Act or the 400YAAHCA, is the federal policy responsible for the establishment of the 400 Years of African-American History Commission and other purposes. The primary duty of the Commission is to lead and manage the national 400-year

commemoration of the 1619 arrival of Africans in the English colonies at Point Comfort, Virginia. Overall, there are six duties that the Commission is responsible for fulfilling as indicated in Section 3(c), the core of the Act. These duties focus on coordinating and facilitating programs, research, and publication activities appropriate for the remembrance. The scope of the activities is the creation of an enduring commemoration that benefits the public's understanding, appreciation, and recognition of the important contributions made by this group and their descendants to the United States of America (USA). Further, the commemoration is to acknowledge the significant impact on these persons and the nation during this 400-year period as a result of enslavement policies and subsequent laws perpetuating racial discrimination.

This entry addresses four areas. Initially, prior enslavement legislation is reviewed. Secondly, the passage of the Act is presented. Thirdly, the Act is highlighted. And fourthly, the Act as a civil rights victory is discussed.

## Prior Key Legislation Regarding Enslavement in the USA

The 400 Years of African-American History Commission Act of 2018 Act marks a major milestone for the USA. At the heart of this Act is the nation's past involvement in the economy of human trafficking or enslavement through the TransAtlantic Triangular Trade or Middle Passage. No other issue has been more contentious in the nation's history. The enormity of this matter was so great that by May 1836, the House of Representatives passed a resolution known as the "Gag Rule." This rule prevented any enslavement legislation from being considered. The goal was to block anti-enslavement petitions from being heard by having them tabled or postponed. This rule was rescinded in 1844. Ending it cleared the way for the eventual passage of the landmark 1863 Emancipation Proclamation Act that eventually freed all enslaved persons after the end of the Civil War on April 9, 1865. The repeal of the rule also enabled the passage of the 13th, 14th, and 15th Amendments, respectively, outlawing race-based enslavement, recognizing the citizenship of the formerly enslaved Africans and African Americans, and granting them voting rights.

Notwithstanding these laws, there was no cohesive policy on how the nation and states would provide for the successful economic and social transition for the emancipated citizens. At that time in history, truth commissions did not exist for nations ending enslavement like the Truth and Reconciliation Commission convened by South Africa in the aftermath of its dismantling of racial apartheid in 1994. Segmented efforts included the revoked Special Field Orders No. 15 of General William T. Sherman that was to allot 40 acres of land per household for emancipated black families in parts of Georgia and South Carolina for a total of 400,000 acres of confiscated land in the former confederate territory (i.e., commonly referred to as "The 40 Acres and a Mule" policy); the Freedman's Bureau that was created by Congress in 1865 and reauthorized through 1877 to assist emancipated blacks and poor whites in adjusting to the changed economy; and reconstruction policy that was to rebuild the nation after the war.

Further, without a national healing and reconciliation process to deal with the moral and ethical issues stemming from the human rights abuses against Africans and African Americans that facilitated unlawful wealth confiscation, the humanity of blacks was never acknowledged. Consequently, blacks, especially the men, became subjected to criminal enslavement (i.e., prison industrial complex or mass incarceration). According to the 13th Amendment, slavery and involuntary servitude is legal in the USA and its jurisdictions as a punishment for a crime conviction. With this understanding, states implemented Black Codes beginning in 1865 that grew into Jim Crow policies of segregation. Federally, segregation was outlawed nearly 100 years later with the historic passage of policies including the Civil Rights Act of 1964, the Voting Rights Act of 1965, and the Fair Housing Act of 1968. However, persisting incongruent criminal justice policies continue the proliferation of criminal

enslavement for African Americans and other socially marginalized groups.

In 1989, Congressman John Conyers (Dem-MI-13) began introducing legislation that focused on creating a type of truth commission that would study the impact of enslavement and its aftermath. This legislative agenda has faced an "invisible gag rule" over a nearly 30-year period. In January 2017 at age 87, Congressman Conyers reintroduced for his final time, H.R. 40, The Commission to Study and Develop Reparation Proposals for African-Americans Act. He retired in December. Two key aspects of H.R. 40, a national apology and reparations, have been particularly controversial. To date, no US President has issued a national apology for the USA's participation in the enslavement economy and operation of a racially segregated society. In June 1997, President Bill Clinton called for a new national dialogue on race and considered apologizing. However, he was opposed to reparations. In 2008, the House issued H. Res. 194 that apologized for enslavement and its aftermath of racial segregation as a step forward toward racial reconciliation. In 2009, the Senate issued concurrent resolution S.Con.Res.26. This legislation was another apology for the enslavement of and racial segregation against African Americans. It was highly criticized for containing a key provision prohibiting the resolution from being used as a cause for future reparations claims. The 400YAAHCA builds on these two resolutions and can serve as a preliminary step toward an impact study based on its key provision for "acknowledging the impact" of enslavement and racial segregation. If passed, Congressman Conyers' legislation could have provided the impact study that would have been ready for the commemoration.

## Passage of the Act

H.R. 1242 – 400 Years of African-American History Commission Act was signed into law by President Donald Trump on January 8, 2018, during the 115th Congress (2017–2018). Congressional sponsors for the Act introduced the legislation in February 2017. Senator Tim Kaine (D-VA) introduced S. 392 on February 15, 2017. His bill had three cosponsors. Representative Robert C. "Bobby" Scott (D-VA-3) introduced H.R. 1242 on February 28, 2017. His bill had 53 cosponsors.

The initial legislation did not pass that was introduced by these congressional leaders in 2016 during the 114th Congress (2015–2016) under the second term of President Barack Obama, the nation's first president of African descent. A major press conference was held during Black History Month on February 11, 2016, announcing the introduction of congressional bills H.R. 4539 sponsored by Rep. Scott and S. 2548 sponsored by Sen. Kaine. Participants at the press conference included Virginia Senators Tim Kaine (D) and Mark Warner (D), Virginia Representatives Robert C. "Bobby" Scott (D-3) and Don Beyer (D-8), Representative G.K. Butterfield (D-NC-1), Congressional Black Caucus Chair, and Hilary Shelton, NAACP Washington Bureau Director and Senior Vice President for Policy and Advocacy. There were six Senate cosponsors and 65 House cosponsors for this initial legislation. H.R. 4539 passed on July 5, 2016. S. 2548 stalled after being placed on the legislative calendar on September 13, 2016.

There were two prior federal policies establishing commissions to commemorate anniversary periods in the USA ranging from 400 years to 450 years. Congressional and civil rights leaders recognized the historical significance of these policies and included elements from these laws in creating the legislation for the 400YAAHCA. The Jamestown 400th Commemoration Commission Act of 2000 or Public Law No: 106–565 was enacted by President Bill Clinton on December 23, 2000. This Commission was created to lead the 2007 national commemoration of the 400th anniversary of the founding of Jamestown. On March 30, 2009, President Barack Obama signed the Omnibus Public Land Management Act of 2009, also known as, Public Law No: 111-11. Under Subtitle E: Advisory Commissions (Sec. 7404), the St. Augustine 450th Commemoration Commission was established to plan and implement 2015 national activities recognizing the 450th anniversary of the founding of St. Augustine, Florida. Both policies included

provisions authorizing appropriations to carry out the commemorations.

## The Act

The Act is officially titled, To establish the 400 Years of African-American History Commission, and for other purposes. It contains nine sections pertaining to following: the short title, definitions, establishment, commission meetings, commission powers, commission personnel matters, plans and reports, termination, and expenditures. The Act prescribes that there are to be 15 members of the Commission based upon selective criteria. The Commission is authorized to seek donated funds for expenditures because there are no authorized appropriations for this national commemoration. By July 1, 2020, the termination date for the Commission, it is to have submitted its final report that summarizes the commemoration activities, budget, and findings and recommendations.

As indicated in the introduction, the core of the Act is the duties clause in the establishment section of the Act – Section 3(c) as shown below:

> SEC. 3. ESTABLISHMENT.
> (c) Duties. —The Commission shall—
> (1) plan, develop, and carry out programs and activities throughout the United States—
> (A) appropriate for the commemoration;
> (B) to recognize and highlight the resilience and contributions of African-Americans since 1619;
> (C) to acknowledge the impact that slavery and laws that enforced racial discrimination had on the United States; and
> (D) to educate the public about—
> (i) the arrival of Africans in the United States; and
> (ii) the contributions of African-Americans to the United States;
> (2) encourage civic, patriotic, historical, educational, artistic, religious, economic, and other organizations throughout the United States to organize and participate in anniversary activities to expand understanding and appreciation of—
> (A) the significance of the arrival of Africans in the United States; and.
> (B) the contributions of African-Americans to the United States;
> (3) provide technical assistance to States, localities, and nonprofit organizations to further the commemoration;
> (4) coordinate and facilitate for the public scholarly research on, publication about, and interpretation of—
> (A) the arrival of Africans in the United States; and
> (B) the contributions of African-Americans to the United States;
> (5) ensure that the commemoration provides a lasting legacy and long-term public benefit by assisting in the development of appropriate programs; and
> (6) help ensure that the observances of the commemoration are inclusive and appropriately recognize the experiences and heritage of all individuals present at the arrival of Africans in the United States.

## The Act as a Civil Rights Victory

The Act is a commemorative policy in and of itself. Yet, it falls within the purview of the congressional policy area of c*ivil rights and liberties, minority issues*. With its passage, it serves as a type of civil rights victory. The Act serves as a new phase for the nation to realize greater levels of fairness, justice, and equality (Frederickson 2005, p. 32) for African Americans and all citizens. This notion of achieving greater social equity is seen in this reflection by Rep. Scott.

> The commission established by the Act will be charged with the important task of planning, developing and implementing a series of programs and activities throughout 2019 that fully tell the story of African Americans, their contributions to the fabric of our nation, and their resilience over the last 400 years. We cannot hope to see greater levels of social equity today, without confronting the harsh truths of our past, and the history of Virginia and our nation cannot be fully understood or appreciated without learning about every aspect of the African-American experience. (personal communication, May 14, 2018)

Specifically, Sec. 3(c)(1)(C) of the Act acknowledges that the nation's policies of enslavement and racial discrimination have impacted African Americans. Retrospective analysis shows that the crux of the civil rights struggle has been fighting to overcome policies of racial animus that have unfairly and unjustly marginalized African

Americans and others too. With this Act, the federal government has taken another step toward moral and ethical responsibility for its actions during this 400-year period. That acknowledgment presents a sea change moving forward. According to Sen. Kaine (personal communication, May 3, 2018),

> It is impossible to understand the American experience without understanding the African American experience from 1619 to today. We cannot imagine the United States without the contributions of African Americans, and our *400 Years of African-American History Commission Act of 2018* will help us tell that story in both its pain and beauty. As much as we would like history to always move in a positive direction, instead we have often seen a series of advances and retractions. From *Dred Scott* to the end of the Civil War, Jim Crow, disenfranchisement, and the imperfect laws we have today, we have to study the African American experience to improve and grow as a nation. This road toward equality had pain, but it also had great beauty: From Barbara Johns' walk-out of Moton High School leading to the landmark *Brown v. Board of Education* case, to Virginia becoming the first state to elect an African American governor, the grandson of a slave. The commission will help us tell that story and understand how far we've come as well as how far we still have to go.

The commemorative activities planned by the Commission can provide opportunities for additional social healing and racial reconciliation. The Act has the potential to help further address the deeply rooted trauma of racism in the nation's history. While not a truth commission, the Commission's role is still morally uplifting. The implementation of a national commemoration that acknowledges the truth about the impact of America's forms of racial oppression against African Americans is critically important for the nation's continued quest to uphold its founding principles for all of its citizens. H. Shelton expresses (personal communication, May 11, 2018),

> The commission established by this legislation will play a crucial role in recognizing, understanding, and celebrating the resilience and contributions of African Americans to the history of our nation. It is fitting and proper that in this era of questions about the treatment of African Americans by officers of the state, as well as an ever-growing influence in the daily lives of all Americans by people of African descent, that this commission be established now. The goal of this committee should be to help all Americans to better understand, and hopefully take steps to mitigate rather than extend, the ongoing negative effects of the institution of slavery four hundred years after it first came to the shores of our nation.

On July 4, 1776, the nation declared its freedom from Great Britain, which included the acknowledgment that there are universal Truths that all people are created equal and given Rights by their God that include life, liberty, and the pursuit of happiness. However, Africans and African Americans of 1619 descent were excluded by the Declaration of Independence, becoming representative of other groups excluded too. It would not be until 1965 when a strategic "plan of action" was proposed to guide the nation in responding to the generational consequences of exclusionary and unequal citizenship for African Americans. Daniel Patrick Moynihan, then Assistant Secretary for the Department of Labor, wrote the, *Report on the Negro Family: A Call to Action*. The report forthrightly acknowledged key issues relating to the ongoing battle for civil liberties and human rights for African Americans that were the direct result of the unaddressed consequences of the nation's enslavement past. In the opening for Chapter 3, "The Root of the Problem," he wrote the following,

> The most perplexing question about American slavery, which has never been altogether explained, and which indeed most Americans hardly know exists, has been stated by Nathan Glazer as follows: "Why was American slavery the most awful the world has ever known?" The only thing that can be said with certainty is that this is true: it was.

Further, Moynihan concluded that the need for a national plan was based upon the belief that, "Three centuries of injustice have brought about deep-seated structural distortions in the life of the Negro American" (1965). Presently, the Act has the potential to engender justice for the four centuries of social inequity. It lends itself toward greater ethical accountability for upholding the integrity of the USA's founding principles.

## Conclusion

The 400YAAHCA of 2018 is the law authorizing a national commission to commemorate the 400th anniversary of the arrival of Africans at Point Comfort, Virginia, in 1619, and other purposes. There are six key duties of the Commission. The commemoration will highlight the resilience and contributions of African Americans in light of their intense struggle for freedom, liberty, and justice since 1619. While a commemorative policy, the Act is a civil rights victory because it moves the nation from "apologizing" to "acknowledging the impact" of enslavement and racial discrimination caused to this group. The commemoration is preparation to help the nation begin a season of social and economic restoration for addressing the impact.

With the magnitude of emotions associated with this subject, the arts and humanities and other creative fields of human expression are essential for facilitating the commemoration. These fields can greatly shape the commemoration's ability to fashion a narrative tapestry of understanding, healing, and reconciliation for this deeply, complex mosaic of human experience. One example of a tapestry thread is a social healing poem, "The Artesian Renaissance" (Adams-Cooper 2016). It defines "The Artesian Renaissance" as,

> . . . a period of healing and restoration beginning in 2019 with consecration, commemoration, and celebration . . . of the 400-year journey for African Americans that has served as, . . . 'a humanitarian bridge for many cultures to be honored for their diversity, richness, and sanctity within a shared future of purpose, prosperity, and peace for all'. . .

|---|---|
| Agency Relationship | The relationship between managers and shareholders/owners of a business organization. |
| Agency Costs | The costs of inefficient decisions made by the managers of a company that impinge upon the shareholders' interests (see section "Background of Agency Costs"). |
| Public Sector Organization | Whereas a "public sector" organization is the one which has its more than 50% shares |

| | |
|---|---|
| | owned by the government, in this section, the term public organization is used to refer to the former type of organizations. |
| Organizational Performance | Organizational performance refers to the profitability, assets turnover, and share price of an organization (see section "Agency Costs and Organizational Performance"). |

## Introduction

An organization incurs several different types of costs to operate and to generate revenue. Most of these costs are quantitative and therefore are easily traceable. These costs generally appear in management accounts as well as financial accounts of the company. However, some of these costs are not quantitative and therefore are difficult to trace back to their source, and agency cost is one such type of cost. Due to intricate nature, it has widely been researched since its discovery in 1976. This section provides a detailed interpretation of the term "agency costs" and an explanation of different types of agency costs. The section provides an in-depth account of how agency costs impact the performance of private as well as public sector and charity organizations. In doing so, it divides these organizations into profit and nonprofit organizations and evaluates the varying level of impact the agency costs have on the performance of these two types of organizations.

## Background of Agency Costs

Agency costs arise due to the presence of an agency relationship in an organization. These costs or the agency issue is found to be more intense in the large-sized organization as these organizations have their shareholders scattered all around the world. The agency issue has existed since the birth of modern corporations; however, the financial impacts of this relationship on the organizational performance were first introduced by Jensen and Meckling (1976) who proposed that, in absence of the shareholders, the managers tend to pursue personal interests rather than the shareholders', leading to a conflict of interest between the two.

Such conflict of interest leads to the creation of different types of costs, known as the agency costs. These costs, unlike the cost of goods sold or salaries and wages, are subjective as well as indirect costs. These costs aren't recorded in any financial statements but are significant enough for the owners to devise strategies to monitor, control, and minimize them. Nevertheless, according to Jensen and Meckling (1976), such cost can be quantified by using various proxy variables and financial ratios. By definition agency costs are the costs of management's decision taken to serve personal interest rather than the shareholders'. For example, if managers declare bonuses at costs of the dividend to the shareholders, then these bonuses are classed as agency costs. Similarly, if managers, to secure their positions, invest in low-risk projects which do not yield significant returns to the shareholders, such investments can also be classed as agency costs. Agency costs, in a nutshell, have many facets and they exist in an organization in many forms. Nevertheless, there are certain proxies which can be used to sum up, identify, and quantify these costs.

The agency costs may arise as a result of a conflict of interest not only between shareholders and the managers but also between the shareholders and debtholder or between two or more parties or stakeholders in an organization. So, using the stakeholders as a base, these costs can be divided into two main categories: agency costs of equity and agency costs of debt. Agency costs of equity are the costs that result from the conflict of interest between the managers and shareholders of an organization. These costs may also arise as a result of the conflict of interest between minority shareholders and large shareholders. The agency costs of debt on the other hand are the outcome of conflict of interest between the shareholders and debtholders. If managers serve the interest of debtholders of an organization rather than its shareholders, then it creates the agency costs of debt. For example, debtholders prefer the

managers to invest their funds in low-risk projects, generally because such investments guarantee the repayment of their funds. However, such investments yield a significantly lower level of returns; and the shareholders prefer investment in the higher-risk projects which yield higher returns. Thus there arises a conflict of interests between the debtholders and shareholders.

## Proxies of Agency Costs

There are three main financial ratios which are used as proxies of agency costs, and these are assets turnover ratios, operating expense ratios, and leverage ratios. Assets turnover ratios determine how efficiently the managers utilize organizational resources in generating revenue. A lower assets turnover suggests an inefficiency on the part of the managers to generate revenue. Operating expense ratio on the other hand reveals management's ability to control organizational expense/costs. A higher operating expense ratio implies managers' incompetency in controlling organizational expenses and vice versa. Leverage ratio signals a conflict of interest between shareholders and debtholders. In this regard, long-term debts to total assets are usually the preferred ratio to determine the leverage level of an organization. A higher leverage ratio indicates the possibility that the managers prioritize debtholders' interest over the shareholders' interest and vice versa.

## Agency Costs and Organizational Performance

The term "performance" can be interpreted differently depending upon the underlying aim of a research study. Generally, there are different indicators which are used to measure the performance of an organization, and these are profitability, assets turnover, share price, etc. However, these indicators are used to measure the objective (quantitative) performance of for-profit organizations. The definition of the term "performance" changes for public sector or nonprofit/charity organizations. Therefore, in nonprofit or charity organizations, the performance is generally referred to the maximization of public utility.

Numerous studies (Geis 2006; Sitkoff 2004) have established that the agency costs exist widely in private sector for-profit organizations; these organizations generally suffer from relatively lower assets turnover, higher operating expense, and higher reserves of free cash flow. Moreover, these costs have been found to have an inverse relationship with the performance of organizations; in private for-profit organizations, a higher level of the operating expense ratio and lower level of assets turnover ratio result in lower organizational profitability as well as lower share price.

Public sector organizations may be for-profit or nonprofit organizations. Nevertheless whatever the aim a public sector organization has, it is likely to suffer from the agency costs like the private sector organizations. This is because the separation of ownership and control also exists in public sector organizations, which is the root cause of agency issue and agency costs. However, unlike a private sector organization, the owner in the public sector organization is generally the government of a country. Moreover, it is not the government that is the ultimate stakeholder in public sector organizations but the general public and taxpayers. Therefore, the government is interested in the maximization of the welfare of the society and maximization of the public utility rather than the maximization of wealth. However, the public sector organizations suffer from a lower level of agency costs as compared to the private sector organizations; this is because the governments are in a relatively stronger position, as compared to private shareholders, to exercise power over the management of public sector organizations. The government requires the management to provide regular reports on the financial and nonfinancial performance of public sector organizations and takes necessary actions when the performance starts falling below a certain threshold. Among the public sector organizations, the organizations which have given relative higher powers to their CEOs suffer from a higher level of agency costs as the CEOs in these organizations are in a stronger position to camouflage

the decisions they make to serve their interests. Thus, in a nutshell, the public sector organizations suffer from a lower level of agency cost as compared to the private sector organization. And overall, the public sector organizations with low CEO powers suffer from the lowest level of agency costs.

However small the agency costs, their presence in itself necessitates the use of different monitoring and bonding mechanisms to control them and prevent them from escalation. The bonding mechanism generally includes offering stock, bonuses, and perks to the management. The mechanism to monitor and control management activities includes regular reporting of companies' performance, an audit of companies' account by external auditors, and hiring external, independent individuals as a member of the board of directors. However, in the case of public sector organizations, some of these bonding and monitoring mechanism cannot be used for various reasons. For example, in the case of public sector organizations, governments assume the ownership of the organizations. So offering stock to the management beyond a certain level will result in the transfer of ownership to the private individuals or at minimum sharing the control of the organization with them. Technically, a public sector organization which transfers 51% share to private individuals becomes a private sector organization. Therefore, governments prefer to use more of a monitoring mechanism to resolve agency issue and minimize the agency costs over the bonding mechanisms. Another commonly proposed approach to mitigate the agency costs in public sector organization is to run such organizations in partnership with the private sector while keeping the overall ownership with the government. This solution prevents the transfer of ownership to the private sector and at the same time benefits from the bonding and monitoring mechanism used by the private sector organizations. However, such a strategy may have certain legal, security, and security implications. For example, a government partnership in the communication industry with the private sector may compromise national security; during critical times, foreign elements may interfere with the network and disable countrywide communication restricting the mobility to necessary resources. Nevertheless, there are other organizations which may safely be operated in partnership with the private sector such as postal service, schools, etc. Besides the public sector organizations, the private nonprofit and charity organization also suffer from agency issues and agency costs. The key difference between the charity and nonprofit organizations is that the nonprofit organization engages in some kind of trading or service-providing activity to generate revenue and the charity organization, generally, does not engage in such activities but instead relies on the subscribers to generate revenue (funds). However, the public organization, private nonprofit organizations, and charity organization are founded to serve a similar purpose, i.e., maximizations of public utility. But in the case of the charity organizations, the subscribers work as the principles of the organizations and the governments assume the responsibility to regulate such organizations. Although these organizations are generally under direct government supervision, yet the level of supervision these organizations face is less than those of public and private sector organization resulting in the creation of agency costs; the management in absence of supervision or in presence of minimal supervision misappropriates organizational resources and work for personal interests rather than those of subscribers' or governments'. Therefore a more suitable approach to mitigate the agency costs in such organizations is to increase monitoring of management activities and supervision of the reporting system.

## Agency Costs in the UK Universities

UK universities are classed as public sector nonprofit organizations serving UK households. The main source of their revenue, besides students fees, is the funding they receive from the UK government, and for that reason, they are closely monitored by various government regulatory authorities. The overall aim of these universities is the provision of quality education to UK students, which is also the criteria to measure their

performance. The quality of education here refers to the ranking of the UK universities as determined by the universities league table. The UK government uses several controlling and monitoring mechanism to manage the performance of these universities. For example, these universities regularly undergo various quality assurance visits by regulatory authorities; they have to get their account audited by a government-nominated auditors, and they have to provide certain reports to the regulatory authorities on regular basis. The universities as well as the overall education sector in the UK are considered as one of the most regulated sectors in the UK and around the world. Perhaps for these reasons, the universities in the UK do suffer from an unconventional type of agency costs which have unique dynamics with the performance of the universities. These universities suffer from relative higher agency costs (in form of higher operating expense ratios and lower assets turnover ratio) as compared to organizations in other sectors; however, the higher level of agency costs seems to have been positively impacting the performance of these universities (Mehmood 2020). As a result, the universities which suffer from higher agency costs provide a higher quality of education than the universities which suffer from lower agency costs. Overall, it can be argued that these universities, rather than focusing on the optimum utilization of the resources, focus more on ensuring the sufficient availability of resources for all their students, that is, a relatively large number of resources are made available to a relatively fewer number of students. Moreover, these universities acquire good-quality resources and hire highly qualified and experienced staff member and lecturers at the cost of increased operating expenses to ensure the provision of quality education. Nevertheless, theoretically, being a public sector organization, these universities are meant to face a certain level of agency costs. However, there are various mediating or transforming factors, such as the government regulation and stringent nature of these regulations, that reverse the role of agency costs in determining the performance of these universities.

Generally, the organizations which are opined to suffer from minimal or zero agency costs are those which are managed by their owners. These organizations can be used as a benchmark to assess the level of agency costs suffered by other organizations. However, the practice of owner managing the organization is mainly found in the micro organizations, whereas the agency costs are mainly prevalent in large-scale organizations. In retrospect, the UK universities present a new paradigm of dynamics of agency costs, that is, a higher level of agency costs may have a positive impact on the performance of an organization provided that the performance is measured in nonmonetary terms that the agency costs are traded off for enhancement of nonmonetary performance.

## Conclusion

Agency costs exist in almost every public and private sector organization except if these organizations are managed by their owners. However, the public sector organizations suffer from a relatively lower level of agency costs as compared to private sector organizations. A key reason behind the low level of agency costs in public sector organizations is the governments acting as principles of these organizations; governments, as compared to the shareholders, are in a much better and stronger position to discipline managements if their interests are misaligned. Generally, agency costs negatively impact the performance of an organization, be it a public or private sector organization. However, in case of UK universities, which are government-regulated nonprofit public organizations, the agency costs have been found to have positive impact on performance of these universities. This unusual relationship between the agency costs and the performance calls for an investigation if this phenomenon (of the positive relationship between agency costs and performance) exists in public sector nonprofit organization operating in other sectors of the economy within the UK and outside the UK, and the UK universities are a unique case study.

# Agency Rulemaking

Elizabeth Wheat
Public and Environmental Affairs (Political Science), University of Wisconsin-Green Bay, Green Bay, WI, USA

## Synonyms

Administration; Bureau; Department; Government

## Definition

Administrative Procedure Act (APA): a federal statute that specifies the rules and procedures federal administrative agencies of the US government must follow. The APA also specifies how agencies must propose and pass federal regulations.
Agency deference: based on the *Chevron* doctrine, if a statute does not directly speak to an issue, then the Congress is deemed to have delegated power, or deferred, to the agencies to use their expertise.
Adjudication: an administrative procedure conducted by an agency that can be formal or informal. In a formal process, agencies conduct hearings that resemble trials and include witnesses, a written record, and final ruling. Informal adjudication consists of inspections, meetings, or negotiations.
Federal Register: a daily publication by the National Archives and Records Administration of the US government in which all proposed and final regulations and administrative orders are made available.
Orders: the product of the adjudication process conducted by agencies. Orders are only binding on the parties involved.
Rulemaking: the process agencies use to create regulations, also known as rules. Through this process, administrative agencies create detailed regulations based on their own scientific expertise, public input, industry feedback, and oversight from congressional committees or other actors.
Rules: the product of the rulemaking process conducted by agencies. The Administrative Procedure Act defines them as "the whole or a part of an agency statement of general or particular applicability and future effect designed to implement, interpret or prescribe law or policy." Rules are binding and enforceable on the public.

## Introduction

In the US political system, federal agencies are part of the executive branch, yet are tasked with many responsibilities that can be perceived as legislative because the rules they produce through rulemaking have the effect of law. This chapter will first look at the statutes defining agency powers, responsibilities, and processes, rulemaking, adjudication, review by the courts and the Congress, guidance documents, and then a controversial rulemaking process from December 2015 by the Environmental Protection Agency (EPA).

## Background

After the Congress fulfills its responsibility to pass bills that become law and delegates responsibility to agencies through enabling statutes, the federal agencies must then implement these laws and provide a level of detail and expertise the Congress could not (Lubbers 2006; Office of the Federal Register 2016; U.S. Legal 2016). This is done through the rulemaking or adjudication process. Agencies can and do use both processes. The

National Archives and Records Administration publishes the rules every business day in the *US Federal Register* (Government Publishing Office 2016). The final rules and orders may also be accessed at the Federal Register website (Federal Register 2016). In the Administrative Procedure Act (APA), which will be discussed shortly, the required steps and rulemaking process are set forth.

As part of rulemaking and adjudication, agencies gather information from studies and surveys, and data collection is done by the agency itself or by other agencies, private companies, public organizations, or consultants. The Office of Information and Regulatory Affairs (OIRA) established by the 1980 Paperwork Reduction Act and part of the White House Office of Management and Budget (OMB) facilitates this process and reviews the agency's proposal and supporting documentation (DoD Regulator Program 2016). Per allocations and budgeting determined by the OMB, OIRA has desk officers responsible for specific agencies and the same officer will review both the paperwork and regulatory proposals. 5 C.F.R. 1320.9 states that a desk officer will allow an agency to start an information collection activity if the officer is satisfied; the information is "the least burdensome necessary for the proper performance of the agency's functions to comply with legal requirements and achieve program objectives; not duplicative of information otherwise accessible to the agency; and of practical utility" (Center for Effective Government 2016). Once the proposal is approved by the OIRA, an "OMB control number" is assigned and an agency may proceed in the regulatory planning process. Based on 2011 staffing allocations, 30–40 desk officers review approximately 3000 information collection requests and 500–700 significant rules annually (Congressional Research Service 2011, p. 30; Center for Effective Government 2016).

## Administrative Procedure Act (APA)

Under the APA, agencies may choose to use either rulemaking (to create rules) or adjudication to create policy and orders (Funk and Seamon 2009). For each of these processes, agencies may use formal or informal approaches. Rulemaking and adjudication, formal approaches, will be the focus of this chapter, but examples of informal ways agencies make policy include the following: "press releases, speeches, statements, letters, advisory opinions, rulings, negotiation and litigation strategies" (Lubbers 2006).

The APA defines a rule as "the whole or a part of an agency statement of general or particular applicability and future effect designed to implement, interpret or prescribe law or policy" (Administrative Procedure Act 1946). They are binding and enforceable on the public. The statute sets forth the general process of creating a regulation which involves the following: an agency begins the rulemaking process and posts plans on the Regulatory Agenda, a rule or order is published on Regulations.gov, a specified timeframe for comments is set, and the final rules are then published on Regulations.gov (U.S. Department of State 2016). Rules and regulations are binding and enforceable, meaning they have the effect of law on the entire public. Orders are only binding on the parties in the adjudication (Lubbers 2006).

One purpose of rulemaking is to inform the public about proposed policies before they take effect. This gives citizens, experts, interested parties, etc. the opportunity to comment and provide additional data or feedback to the deciding agency (Administrative Procedure Act 1946; Araiza 2000). The agency's rulemaking record, data, and analysis can also be evaluated during this time. A second purpose is for the agency to have a forum to respond to the public's comments and create an official record of its decision-making that can be reviewed by the courts (U.S. Department of State 2016). The National Archives maintains an e-Rulemaking website as a guide to electronic rulemaking initiatives and to provide interested parties with the ability to comment online (National Archives 2016).

Agencies specify the length of time for public comments in the "Dates" portion of the Federal Register. Most periods range from 30–60 days, but agencies can extend it longer if needed and justified. If an agency feels it has not received

enough high-quality comments or there is a public demand for more time, agencies may reopen comments or issue multiple proposed rules (Office of the Federal Register 2016). In addition to written or digital comments, agencies may hold public hearings to allow the public to submit statements or data. Some agencies such as the Federal Motor Carrier Safety Administration (FMCSA) use webcasts or interactive web sessions to help broaden the audience giving comments (Minimum Training Requirements for Entry-Level 2013). Once the comment period has concluded, an agency is required to base its rule on the record, data, expert opinions, comments, and additional information gathering during the proposed rule stage (Office of the Federal Register 2016).

## Rulemaking Process

Prior to issuing a proposed rule, an agency may receive a "Petition for Rulemaking" from a citizen or it may choose to initiate the rulemaking process itself. In the early stages of developing a rule, public comments may be submitted and the agency can publish an "Advance Notice of Proposed Rulemaking" (ANPRM) in the Federal Register (Cornell University 2016). These notices are part of the notice-and-comment processes in administrative law. Any interested person or group may submit feedback (Office of the Federal Register 2016; Center for Effective Government 2016).

Once an agency has chosen to undertake rulemaking, it must comply with Executive Order 12866 Regulatory Planning and Review and publish a "Regulatory Rule" yearly in the fall and an "Agenda of Regulatory and Deregulatory Actions" each April and October (Center for Effective Government 2016; Department of Defense 2016). These documents are called the "Unified Agenda" and agencies use it to announce their actions and update the public in compliance with the APA (Office of the Federal Register 2016). These publications are important for notifying the public that an agency plans to develop regulatory actions.

A final rule will include a "Summary" section discussing the problems and goals necessitating the rule, provide an "Effective Date," and identify the legal authority for making the rule. Any supplementary information obtained during the notice-and-comment period will be published with the final rule (Cornell University 2016; Office of the Federal Register 2016). As stated in the Congressional Review Act, final rules take effect no less than 30 days after the publication date with significant and major rules go into effect a minimum of 60 days later (Center for Effective Government 2016; Administrative Procedure Act 1946). This extended period of time allows the Congress and the Government Accountability Office (GAO) to review a rule and consider passing a resolution of disapproval to be signed by the president. Only one rule has been disapproved by the Congress since 1996 when the process began (Office of the Federal Register 2016). On August 6, 2015, Senators Ayotte (R-NH), Collins (R-Maine), Cornyn (R-TX), Ernst (R-IA), Johnson (R-WI), King (I-ME), and Perdue (R-GA) introduced S. 2006: Regulatory Accountability Act, calling for greater congressional input on how regulations are developed and requiring agencies to do further advance work to justify the need for issuing additional rules (Nord 2015; Regulatory Accountability Act of 2015 2015).

## Types of Rulemaking

There are three types of rulemaking: formal, informal, and negotiated. Formal rulemaking is similar to a courtroom procedure and requires a hearing on the record with evidence before an administrative law judge (ALJ) or panel of judges. The ruling from this hearing may be reviewed by a higher federal court. The APA puts forth formal rulemaking procedures at the federal level, but states may have separate formal rulemaking procedures for state laws (Justia 2016).

Using informal rulemaking under the APA, informal rulemaking involves notice and comment and publication in the Federal Register. This will be discussed shortly in the Rulemaking section of this chapter.

Negotiated rulemaking, "Neg-Reg" is conducted by the agency formulating the rule. A small number of interested parties are invited to discuss the rule and attempt to reach a consensus that can then be used as the basis for the agency's proposed rule (Office of the Federal Register 2016). The Negotiated Rulemaking Act of 1990 provides this structure and the Congress can mandate an agency to use it when they pass a bill. This process enables agencies to improve their rule by receiving feedback and addressing concerns affected parties may have prior to the rule's enactment. Due to the difficulty of incorporating the views of many diverse parties who could be affected by a rule, though, agencies do not use Neg-Reg often (Center for Effective Government 2016).

## Types of Adjudication

Adjudication can be formal or informal. In a formal process, agencies conduct hearings that resemble trials and include witnesses, a written record, and final ruling. Informal adjudication consists of inspections, meetings, or negotiations. Adjudications are held by administrative law judges, who issue a ruling subject to appeal to the agency's highest administrative authority (U.S. Legal 2016).

## Rulemaking Versus Adjudication

Whether an agency relies on rulemaking or adjudication varies throughout the bureaucracy and the Congress may require one process or the other in a law (Office of the Federal Register 2016). For example, the National Labor Relations Board (NLRB) primarily uses adjudication and has been criticized for not using rulemaking on more occasions (Lubbers 2010). Environmental statutes such as the Resource Conservation and Recovery Act and Clean Air Act, in contrast, require the EPA to issue rules on specific issues such as performance standards and national ambient air quality standards (Lubbers 2006).

*SEC v. Chenery Corporation* (1947) first noted the general concept that it is the agency's choice between rulemaking and adjudication. The majority opinion held, "[t]he function of filling in the interstices of the Act should be performed, as much as possible, through the quasi-legislative promulgation of rules to be applied in the future. . .the choice between proceeding by general rule or by individual, ad hoc litigation, is one that lies primarily in the informed decision of the administrative agency" (Araiza 2000; Lubbers 2006). In *Christensen v. Harris County* (2000) and *United States v. Mead Corporation* (2001), the Supreme Court held that the deference explained in *Chevron v. NRDC* (year) should apply to agencies when the Congress has delegated rulemaking power to the agencies as long as their interpretation is consistent with that power (Lubbers 2006).

In some instances, when adjudication was used to make policy rules, there have been questions of whether §553 of the APA on Rulemaking, requiring notice and comment, was violated. The NLRB received this criticism because of the agency's refusal to use rulemaking (Lubbers 2006). The Supreme Court upheld the *Chenery* rationale in *NLRB v. Bell Aerospace Co*. (1974).

Former Administrative Conference of the United States General Counsel Richard K. Berg identified the following advantages of rulemaking:

1. Rules are fairer to participants because they allow broader participation.
2. It is a prospective process in contrast to the responsive nature of adjudication.
3. Rules provide more clarity and uniformity.
4. Rules are more efficient and flexible because of the notice-and-comment provisions.
5. Rules give agencies greater control over their policy agenda because they do not have to wait to respond to an issue.
6. Rulemaking is more efficient because they produce a general principle instead of case-specific decision (Lubbers 2006; Berg 1986).

Advantages of adjudication include the following: (1) it can avoid the complex procedures of rulemaking; (2) it may be easier to modify an order than major rules; (3) adjudication can minimize conflict with overseeing committees or

agencies; and (4) decisions reached by adjudication are situation-specific and can therefore avoid being over inclusive or under inclusive (Eyer 2008). Limitations of adjudication include the narrow formal scope of the process, limited number of parties involved, "nature of the dispositive facts as 'adjudicative' rather than 'legislative,' and the incremental nature of the common law court system" (Arazia 2000).

## Review

In addition to citizens having opportunities to review and provide feedback, the Office of Information and Regulatory Affairs (OIRA) assists the president with analyzing draft-proposed rules deemed "significant." If a rule is found to raise an important policy issue or have economic effects, it is classified "significant" and the drafting agency must include both a cost-benefit analysis of the rule, known as a "Regulatory Impact Analysis," and discussion of proposed alternatives (Cornell University 2016; Office of the Federal Register 2016). Additional evaluation may be done for impacts of rules on small businesses, state, local, and tribal governments, and families.

After the rulemaking process has concluded, the OIRA and president may review a proposed "significant" rule prior to publication in the Federal Register. Agencies can also consult with other agencies that will be responsible for helping with implementation, and in some cases this interagency review is mandatory (Center for Effective Government 2016). For example, when the Environmental Protection Agency is designating a Department of Defense (DOD) Superfund site, the DOD would have likely review the rule and provide input to the EPA. Similarly, the Department of Transportation (DOT) would review EPA rules on motor vehicle emission standards. Most mandatory review involves the Office of Management and Budget (OMB) (Models in Environmental Regulatory 2007).

The final area of review is done by the court system. A court can review a rule for the following: whether it is constitutional, if it exceeds the agency's legal authority, was it made without the APA-required notice-and-comment period, was it arbitrary and capricious (as defined by the APA and legal precedent), did the agency administrator abuse his/her discretion, or did the agency fail to act in a timely manner (Office of the Federal Register 2016; U.S. Legal 2016). If a court finds the agency made an error or any of these areas of review failed, the rule is set aside or vacated temporarily to give the agency the opportunity to correct the problem (Office of the Federal Register 2016).

## Guidance Documents

To assist the public in understanding how a regulation applies, agencies may issue interpretive rules, policy statements, or other guidance documents. These documents can explain how to interpret a rule as it applies to a specific statute, as it applies to a specific case, or how a citizen or business should comply. Guidance documents cannot set new legal standards and do not go through the APA notice-and-comment process. They may be published in the Federal Register or on an agency's website (Office of the Federal Register 2016).

## EPA "Waters of the United States" (WOTUS) Rulemaking Controversy

To illustrate one example of the challenges of rulemaking for an agency and affected parties, the Environmental Protection Agency's WOTUS rule will be discussed (Environmental Protection Agency 2015). There are two rulemaking disputes in this case: the rule itself and the means the EPA used to elicit support for the rule during the public notice-and-comment period.

On June 29, 2015, the EPA redefined "waters of the United States" in 80 Fed. Reg. 37054 and it became known as the Clean Water Rule. The rule was set to take effect on August 28, 2015, but a federal district court judge issued a stay right away that covered 13-state party to one legal challenge, and a federal appeals court affirmed

the stay, extending it to the entire country (Leahy 2015). The Clean Water rule would create eight categories of jurisdictional waters with the majority covered by the CWA and a few covered by the agency's "significant nexus" test. The purpose of these categories from the agency's perspective is to clarify the jurisdictional boundaries for the EPA and Army Corps of Engineers and to state which types of water need a case-by-case analysis instead (Beck 2015). The rule itself was designed to make the National Pollution Discharge Elimination System (NPDES) permit system easier and to make sure Corps-issued NPDES permits were in compliance with 2001 and 2006 opinions of the Supreme Court (Montgomery and Antoniolli 2015; Cohen 2015).

Critics of the rule argue that it expands the EPA's authority too far, violating the statute's original intent and the APA, that the "significant nexus" test could be difficult to apply in practice, and that the rule is unconstitutional. Almost immediately after the rule became final, there were ten pending lawsuits in eight district courts and 29 states participating in two federal suits (Montgomery and Antoniolli 2015; Leahy 2015; Cohen 2015). As one example of the court's involvement, in *State of Ohio*, et al. *v. U.S. Army Corps of Engineers* (2015), the Sixth Circuit issued a nationwide stay of the EPA's rules defining "waters of the United States" under the Clean Water Act (CWA) (Cavender 2015).

The GAO issued a finding on July 24, 2015 stating the EPA complied with APA requirements prior to issuing the final rule (Montgomery and Antoniolli 2015). On December 14, 2015, though, the GAO issued a report that found the EPA violated federal law on grassroots lobbying when it used Thunderclap to lobby for public support for the WOTUS rule (Fatka 2015). Thunderclap is a social media service to share messages across multiple social media platforms including Facebook, Twitter, and Tumblr (Thunderclap 2016). The GAO estimated Thunderclap posted the EPA's message on 980 social media accounts on September 29, 2014, and reached approximately 1.8 million people (Fatka 2015).

The legal decision by the GAO argued the EPA's use of Thunderclap was "covert propaganda" and violated restrictions on indirect or grassroots lobbying. It also violated the Anti-deficiency Act, barring employees of the government from using funds unless legally authorized. The GAO stated, "At issue here is whether the EPA violated publicity or propaganda and anti-lobbying provisions concerning the use of its FY 2014 and 2015 appropriations. The use of appropriated funds associated with implementing EPA's Thunderclap campaign and establishing hyperlinks to the NRDC and Surfrider Foundation webpages violated prohibitions against publicity or propaganda and grassroots lobbying contained in appropriations acts for FYs 2014 and 2015. Accordingly, EPA should report the violation to the president and Congress, with a copy to the Comptroller General, as required by the Anti-deficiency Act. The agency should determine the cost associated with the prohibited conduct and include the amount in its report of its Anti-deficiency Act violation" (Government Accountability Office 2015; Leahy 2015).

Lobbying organizations such as the National Cattlemen's Beef Association, American Farm Bureau Federation, and Heartland Institute have strongly opposed the WOTUS rule and supported litigation to try and stop it from taking effect (Cohen 2015). The House of Representatives voted to prevent the rule from taking effect and the Senate attempted to do the same, but fell short of the necessary 60 votes to override President Obama's veto on January 19, 2016 (Fatka 2015; Korte 2016). In his veto message, President Obama said, "Too many of our waters have been left vulnerable. Pollution from upstream sources ends up in the rivers, lakes, reservoirs, and coastal waters near which most Americans live and on which they depend for their drinking water, recreation, and economic development" (Korte 2016).

The WOTUS controversy illustrates the difficulties of agencies such as what the EPA can face when they are trying to follow statutory requirements such as the CWA and presidential directives for policy improvements. It also shows how a rule can be interpreted and applied by the court system.

## Conclusion

Agency rulemaking is an important process for making policy and for giving citizens the opportunity to participate. Through statutes such as the APA, agencies have formal and informal procedures to follow and both the Congress and the courts retain oversight authority. Though not without its limitations, agency rulemaking plays a critical role in US policymaking.

# Agency Theory in Organizations

Fred Thompson
Atkinson Graduate School of Management, Willamette University, Salem, OR, USA

## Synonyms

Conflicts of interest; Financial economics

## Definition

Agency theory is concerned with a specific class of transactional relationships, those involving actors with partially conflicting interests, which are potentially fraught by imperfect and/or asymmetric information.

## Introduction

In this particular class of transactions, the dyad comprises a nominal superior and a nominal subordinate – in the literature of social institutions, master-servant, supervisor-supervisee, employer-employee, or principal-agent relationships. Hence, unlike other strategic relationships, we presume that the preferences of one of the parties, those of the nominal superior, are somehow more legitimate than those of the other. This presumption is fundamental to an understanding of the concept.

Shakespeare's *Tragedy of Romeo and Juliet* aptly illustrates the nature of the agency relationship. In this story, a young lady, Juliet, entertains proposals from various suitors. She selects Romeo, based on ex parte talks from her balcony. Of course, our initial reaction is that Juliet's preference for Romeo is her business alone. And, we would be callous, indeed, not to sympathize with the star-crossed lovers. But, this reaction reflects an implicit assumption that this is a transaction involving two principals, Romeo and Juliet. It is not. The tragedy arises because Juliet is not a principal in Shakespeare's story; she is an agent. The paterfamilias Capulet is the principal and he counts on Juliet to accept Paris, his friend, as her partner. Unfortunately, Juliet's preferences are not the same as her father's. Moreover, because Capulet is unaware of Juliet's inclinations or Romeo's seductions, she is given the opportunity to pursue her infatuation and disloyally does so. In the end, "all are punished": Juliet dies, Romeo dies, and so does poor, blameless Paris. Moreover, this unhappy outcome can be attributed directly to monitoring and enforcement failures on the part of Capulet.

Note that, like all problematic transactional relationships, the Capulet-Juliet dyad is characterized by imperfect information or, perhaps more correctly, asymmetric information. Under perfect information, transactions are inherently costless

and compliance perfect. Principal-agent relations are characterized by asymmetric information of a specific kind, however: the agent is presumed to have valuable information or expertise, which the principal lacks but must also rely upon. This means that the principal cannot know precisely what the agent can do, short of replicating the expertise of the agent, which would, of course, preempt the function and role of the agent. But left to their own devices, it also means that agents can exploit this asymmetry to pursue their own aims at the principal's expense or, using the language of transactions-cost economics, to behave opportunistically. Moreover, because this implies that the principal's full menu of options is inherently truncated, the agent may be uncertain as to the principal's preferences as well. This is important because the value of agent commitment and initiative depends on the extent of alignment between what agents think success means and what principals think it means.

### Transaction Costs

The following analytical generalizations reflect Oliver E. Williamson's ideas about the economics of governance (1967, 1985), which hold that various kinds of transactions are associated with differential hazards. These hazards are a consequence of the human propensity to exploit opportunities when they arise. Where principal-agent transactions are concerned, because the preferences of the nominal superior are presumed to be legitimate, opportunism on the part of agents is frequently described as fraud, abuse, and waste. These are not good things. Avoiding them leads to the elaboration of institutional mechanisms, contracts, norms, and rules, which structure relations, activities, and behavior, that are designed to encourage productive outcomes while limiting or avoiding their adverse accompaniments.

Under Williamson's formulation, the comparative advantage of alternative institutional arrangements boils down to a simple matter of cost minimization: minimizing the costs of opportunistic behaviors, which an arrangement allows, together with its running costs. For example, carrying out transactions through organizations rather than markets or through government rather than private organizations makes sense where it reduces this sum. Reduction does not imply elimination, however. This fact implies a very important corollary to the basic governance insight; there are very few if any perfect governance mechanisms; the conditions that adversely affect markets, for example, also impair organizations and governments (Gibbons 2003). Even so, there is a second corollary: governance mechanisms tend to evolve over time to check the adverse consequences of opportunistic behavior and/or to reduce monitoring and enforcement costs (Brown and Potoski 2003).

### Game-Theoretic Aspects of Agency Theory

Bargaining power plays an important role in agency theories. Consequently, most analysts these days rely on bargaining solutions from cooperative game theory like the Shapley value, to make sense of theories of cooperative games with incomplete information, including specifically, principal-agent relationships.

How do principals induce agents to align their actions with the preferences of principals? If the task is "simple," optimal effort can be achieved by making compensation contingent upon outcomes. For example, it is frequently assumed that, if managers (agents) were allowed to do as they wished, they would maximize revenue rather than free cash flows or that budgeters (agents) would overestimate outlays and low-ball revenue forecasts rather than provide unbiased forecasts. In both cases, it is easy to show that, if owners (principals) want agents to focus on profits or elected officials (principals) want unbiased estimates, they can easily induce agents to align their actions with the principals' preferences (see Jensen and Meckling 1976; Choate and Thompson 1988, 1990).

Tricky situations arise where the relationship between effort and outcome is uncertain and neither effort nor outcomes are directly observable, where outcomes depend upon teamwork among multiple agents, where outcomes are complex and multisided (and cannot be converted to a single unidirectional metric, e.g., via a balanced scorecard), and where both the relationship between effort and outcomes are inherently uncertain and

agents are risk averse (in the executive compensation situation noted in the previous paragraph, e.g., where not only do principals want agents to focus on profits rather than other things, they also want them to maximize profits).

The standard game-theoretic outcome in all of these tricky situations is one in which the outcome is, from the standpoint of the principal, inherently less than perfectly optimal. According to Bengt Holmstrom and Paul Milgrom (1987, see also 1991), the best outcomes that can be realized in practice will generally be obtained via straightforward contracts, composed of a fixed wage plus a bonus that varies directly with output. They claim that, because this kind of incentive scheme is less susceptible to manipulation by agents under a wide range of situations and circumstances, it is the most "robust" method for dealing with opportunism (see e.g., Thompson 1984). Implicitly, they argue that, because we cannot get the best outcome that is theoretically possible, we ought to be content with results that are pretty good no matter what.

In contrast, Eric Maskin and Jean Tirole (1999) argue that events, which are unforeseeable ex ante or impossible to verify ex post, may not really matter all that much, because agents can be presumed to care only about how possible future circumstances affect mutual valuations and can agree to contingent payoffs that will induce optimal actions in the present. They also show how agents can be motivated to reveal their true valuations when unforeseen events occur, presenting a workable mechanism that induces truthful revelation of private value, thereby defeating the information problem at the heart of agency relationships. As Kevin Bryan *explains*, "Taking the model's insight seriously but the exact mechanism less seriously," Masten and Tirole imply "that incomplete contracts don't matter if we can truthfully figure out *ex-post* who values a relationship at what amount, and there are many real-world institutions like mediators who do precisely that."

## Agency Theory in Public Administration

So far as principal-agent relations are concerned, students of public administration have concerned themselves primarily with mediating institutions, their elaboration, and their working. As Barry Mitnick (2015), one of the first scholars to propose a theory of agency and almost certainly the first student of public administration to do so, explains, there is an economic theory of agency and an institutional theory of agency. They are both different and complementary. Economists focus primarily on problems of compensation, contracting, and incentives. Mitnick, early on, observed "that institutions form around agency, and evolve to deal with agency, in response to the essential imperfection of agency relationships: Behavior never occurs as it is preferred by the principal because it does not pay to make it perfect. But society creates institutions that attend to these imperfections, managing or buffering them, adapting to them, or becoming chronically distorted by them."

Mitnick's (1975) model of policing in the context of agency relations and managerial discretion incorporated these basic notions. His model had three elements: (1) policing (observation and enforcement) mechanisms, (2) the allocation of resources between policing and other activities, and (3) the agent's reaction to policing. He explicitly applied the model to government regulation of business, arguing, "that public interest groups are constrained (and perhaps in some cases may elect) to police the manifestations of agent fidelity in the regulatory agencies rather than adherence to public interest criteria. This has possibly paradoxical consequences in that return to public interest criteria may thereby be reduced." Later, George Tsebelis (1989), focusing primarily on its third element, replicated this insight using a formal game-theoretic structure, and Gary Miller (1993) brilliantly explicated the centrality of principal-agency relations to an understanding of the nature of organizations and hierarchy. Indeed, it may be argued that Mitnick's concern with policing adumbrated the basic logic of Williamson's transaction-cost analytic framework. That, outside of the community of scholars concerned with government regulation of business, Mitnick's work has not gotten the attention it arguably deserves is, therefore, something of a mystery, although it may have something to do

with its lack of clarity with respect to the identity of principals and agents, from the standpoint of methodological individualism, a weakness not apparent in the work of Tsebelis, Miller, or Williamson.

It is more likely that the answer goes to the complex chain of putative principal-agent relationships characteristic of governments in general and the American federal government in particular – the public-elected officials; elected officials-agencies; agency executives-frontline workers, staff specialists, etc.; frontline workers-regulated businesses; and so on and so forth. Most analysts focus on a single dyad in this chain, and Mitnick tried to comprehend them all at once.

One of the more fraught of these dyads is the relationship between congress and executive agencies. Matt McCubbins, Roger Noll, and Barry Weingast (McCubbins and Schwartz 1984; McCubbins et al. 1987, 1989) argue that, where this dyad is concerned, acute information asymmetries render direct monitoring of agency performance problematic or ineffective. Nevertheless, they argue that "elected officials can gain leverage over bureaucrats through informal oversight mechanisms and carefully structured administrative procedures to guarantee that the relevant legislative constituents are well served." Frequently, the fix takes the form of what McCubbins, Noll, and Weingast call "fire-alarm" mechanisms. Under these mechanisms, responsibility for alerting politicians to agency decisions that stray from preferred policy paths is assigned to the parties who bear the consequences of the agency's failures, that is, interested third parties. McCubbins, Noll, and Weingast conclude that elected officials may more or less satisfactorily rely on third parties to monitor public employees' compliance with policy priorities in a large number of fields, although they acknowledge that third-party monitoring also creates problems of its own.

Undoubtedly, the threat of third-party opportunism is omnipresent under existing institutional arrangements. Moreover, the threat of opportunism can increase with institutional complexity. Nevertheless, its adverse consequences can be minimized. Indeed, many of the design features of third-party monitoring mechanisms have evolved to remedy the hazards associated with third-party opportunism. These carefully structured administrative procedures ensure that third-party interventions will be promptly dealt with, that spurious and immaterial interventions will be rejected, and that valid, material interventions will be sustained.

The more general problem with institutions – that, once put into place, they are often inimical to learning – is more worrisome. Moreover, failure tends to predispose principals to impose ever more rigid procedures, greater monitoring, and severer sanctions where deviations from prescriptive standards are detected. Consequently, the upshot is all too often a flight from discretion on the part of agents, leading to inaction or to a rigid and unthinking compliance with the rules, an important aspect of the more general phenomenon Mitnick and others have identified.

This is not surprising; the issue was at the heart of the Finer-Friedrich debate, one of the foundational dialogues defining public administration as a field of scholarship and instruction in the United States. Herman Finer defended congressional supremacy, the rule of law, and detailed, legislatively authorized, input-oriented spending plans, with frontline workers, staff specialists, and middle managers fitted into hierarchies characterized by the decomposition of activities and tasks, functional specialization, sequential processing, standardized procedures, and vertical integration. In contrast, C. J. Friedrich insisted upon the inevitability of administrative discretion, the value of technical expertise, and the importance of professional norms and standards. As he observed, "no mere reliance on some traditional device can be counted upon to render the vast public services of a modern government responsible." Indeed, Friedrich was skeptical that this hazard could be remedied entirely: "responsibility must remain fragmentary because of the indistinct voice of the principal whose agents the officials are supposed to be" (Friedrich 1941, p. 20). From our vantage point, it appears that the crux of the issue in this epic debate goes directly to the identity of the principals in the relationship – congress or the public. Friedrich also identifies one of the key

problems specific to this particular principal-agent relationship – uncertainty as to the principal's preferences.

Recently, using a principal-agent formulation and game-theoretic analysis, in which agents obey normative principles of rationality, Gary Miller and Andrew Whitford (2016) have revisited Friedrich's position. They posit that government exists to create public value – defined largely in terms of promoting the general welfare and stability – and ask how public servants' actions can be aligned with those goals. Like Friedrich's, their answer stresses the importance of "professionalism, which embeds its professional practitioners in professional norms and culture, and incidentally mitigates corruption." More originally, they show, using common language and techniques to describe a broad range of institutional arrangements, how long-term, cooperative relationships – which "(when successful) bind agents to pursue public value in exchange for autonomy" – can be negotiated. These mechanisms are imperfect, but they often go a long way toward balancing task alignment with discretion – to solving the principal-agent dilemma that lies at the very heart of democratic governance.

## Conclusions

Agency theory has a myriad of implications for structuring incentives, designing mechanisms, and making sense of institutional arrangements. The basic framework can be applied to a wide array of circumstances because the principal-agent relationship presents itself in divers ways: public-elected official, congressional committee-bureau head, manager-worker, teacher-student, regulator-business, and so forth. Hence, the basic insights are reflected in a wealth of applications each of which adds to the body of theory and our understanding of governance devices and the control of programs and activities.

School of Public Affairs and Administration, Rutgers, The State University of New Jersey, Newark, NJ, USA

## Synonyms

Goal setting; Issue recognition; Plan of action; Prioritization

## Definitions

An agenda is a list, outline, or plan for discussion and/or action among groups and individuals. The inclusion and order of the items on an agenda reflect their priority and importance to its authors and participants. "Agenda setting" aims to influence what is or is not included in an agenda. It is a principal component in decision-making activities at all levels of government. Recognizing that governments rarely have the resources to attend to all of the issues that concern all of their constituents, setting governments' policymaking agenda is a competitive process that involves a range of stakeholders, who engage in getting certain items onto an agenda, as well as keeping others off (Birkland 2020).

## Introduction

Processes of influencing governments' agendas involve a range of stakeholders, both inside and outside of government, with diverse interpretations of the issues and varying opinions on the best way to address them. Although these situations can be contentious, stakeholder involvement in agenda setting can contribute to clarifying and communicating the issues that impact their lives and to promoting a better understanding of them by public policy decision-makers. Several agendas exist simultaneously, and a number of political and social factors can influence public attention to issues and their desire to get them onto governments' agendas. Agenda items are then selected for deliberation by elected officials who consider options for addressing them. Depending on consensus among elected officials, these deliberations may lead to public policy developments that respond to public needs and expectations. Some prevailing explanations of agenda setting processes are presented here. They include political influence, windows of opportunity, focusing events, lessons from a disaster, media influence, and public participation in decision-making that impacts their lives. Finally, some brief comments on agenda blocking are included.

## Agenda Setting Processes

### Political Influence

Elected and appointed officials ultimately determine what is included in governments' policy decision-making agendas for majority approval. The delay in including some issues may rest on the uncertainty about adequate support from parties involved. In the interim, political actors engage each other, negotiating what compromises can be made regarding their different priorities. But the balance of power plays a significant role. Those with majority representation in the debate have the advantage of being able to dominate and of avoiding compromise.

The public interest and the common good are traditionally expected to be at the core of public decision-making, but it is essential that determining what comprises these, in contemporary contexts, should remain open for debate, among both elected officials and those whom they serve. This is especially pertinent in democratic politics where public opinion should matter. Over time, however, there has not always been congruence between political priorities and the common good. The needs of minority groups have not always been represented, whether defined by economic standing, disability, gender, or race. Such groups have benefitted from coalitions formed by advocates outside of government with shared interests and concerns, who unite to augment their voice in the political arena. This can be effective in

attracting political interest and in moving minority concerns onto governments' policy agenda.

Advocates and related interest groups devoted to articulating public interests also partner with career bureaucrats in influencing governments' agenda. Such groups provide an abundance of information from their supporters and can be a good resource for explaining the issues that truly concern them. By partnering with the bureaucrats in issue-related government agencies, agenda issues can be presented in the context of what is achievable within the organizational framework of the public sector, including nonprofit organizations within those interest groups. These partnerships can be especially valuable in lesser developed countries but elsewhere also.

One of the challenges facing elected officials in working through their agenda is difficulty in responding to public demand due to the diversity that it comprises. The range of issues that may be presented to a government at any particular point in time may be enormous. Governments may prioritize issues based on existing capacities to respond, for example, existing expertise, prior experience, organizational infrastructure, and overall availability of resources. Some issues, however, require investments in research and development, such as in the case of environment preservation and utilization of alternative sources of energy. It can be difficult to keep items on governments' agendas when the solutions are not clear. In the interim, introducing a focus on sustainability has been meaningful in some parts of the world (United Nations 2030 Agenda for Sustainable Development).

Indeed, organizing issues according to common causes can be empowering to governments. Poverty, for example, can be the cause of poor health, homelessness, and poor access to education. Attention to reducing poverty can favorably impact the related social issues, while contributing to productivity and economic growth. Another common cause can be the lack of access to information about existing public programs that provide opportunities for betterment. Improvements in the dissemination of public information can reassure the public of their governments' responsiveness. Focusing on these central underlying causes may also augur well for elected officials seeking to strengthen their political careers.

## Windows of Opportunity

John W. Kingdon (2001, 2003) explains agenda setting in relation to how the agenda for public policy formulation is influenced. To do so he creates a model in response to the questions of how issues attract the government's attention at a particular time, by identifying who influences this and why and, also, why some issues capture the government's attention and others do not. He identifies the following four main factors that create interest among those in and around government: systematic indicators, feedback from existing programs, changes in perception, and focusing events.

### Systematic Indicators

Systematic indicators draw attention to the magnitude of an issue. It is recognized that these may be circumstantial, such as rising numbers of teenage pregnancies, fatal highway accidents, or casualties of war, but by recognizing the value of such information, it is understood that data gathering would also keep government officials abreast of emerging issues. This promotes the inclusion of a research competence within government agencies, which ideally would enable them to plan ahead in their policy development.

### Feedback from Existing Programs

Feedback from existing programs is seen as a valuable source for evaluation and performance measurement that should be built into all of the public service activities as an indication that public servants are committed to addressing the best interests of citizens. At the very least, this feedback is considered to directly monitor the accuracy of policy decisions. A large body of performance measurement literature and citizen involvement in such processes has evolved to address this. Some of the issues that remain on governments' agenda and benefit from these kinds of feedback are national defense, public safety, and the economy.

### Changes in Perception

Changes in the perception of issues can alter how they are brought to governments' attention. An example of this is the earlier belief that the HIV virus could be contacted simply by touch. Many citizens would have lobbied for the segregation of infected persons, but informed government officials recognized that developing education programs would be more effective, less costly, and more beneficial to the society in terms of preserving family relations and the well-being of those infected with the virus. It is also worthy of note that facts and ideas are often reinterpreted and manipulated in the agenda-setting process (Kamieniecki 2000).

### Focusing Events

Focusing events are described as situations that draw attention to certain conditions. These might be protest marches and similar demonstrations of the public's objection or dissatisfaction, or simply an indication of a need too long neglected. Thoman A. Birkland (2007) further explains that focusing events expose different weaknesses in government, depending on their magnitude, from crises to disasters to catastrophes. He explains that whereas a crisis reveals a weakness at the organizational level, a disaster points to more widespread failure across government, and a catastrophe might render an entire country inoperative and reliant on international support. Focusing events, therefore, expedite the passage of issues on political agendas.

Kingdon (2001) argues that the four factors described above present "windows of opportunity" either because the problem is pressing, verging on a crisis, or creating an opportunity for people to advocate their solutions to it or because the political viewpoint changes and advocates take advantage of the circumstances to push their proposals. At these moments, a problem is recognized, a solution is available, the political conditions are right, and these three streams get joined together. He emphasizes that these windows are "choice opportunities," open for only a limited period of time due to the dynamics of the social and political environments. If there is a change in the political viewpoint, for example, a new administration comes in, that new administration creates opportunities for some advocates and closes windows for others. On these occasions advocates can join their proposals to the pressing problems as solutions, or otherwise they push their proposals at another time when the political conditions may be right. If a proposal is not ready at the time when the window opens, it is too late to develop it at that point, and any action is delayed until another window of opportunity comes.

## Lessons from Disasters

Further to the position taken by Birkland (2007) that focusing events accelerate the passage of issues onto governments' agendas, he argues that such events can provide the foundation for instrumental, political, and social learning. Regarding instrumental learning, the accumulation of knowledge about policy failure at the implementation stage can be the result of the effects of a focusing event. This may highlight the need for policy refinement, as well more proactive ideas that could build on experiences and new awareness. Focusing events demonstrate that political positions previously upheld have become more difficult to defend with evidence of policy failure. It becomes necessary to reconsider previous arguments and to develop different approaches to interpreting issues in the aftermath of significant policy failure. Social learning brings awareness of vulnerabilities that policy failure highlights. The public may become more aware of factors that threaten their quality of life and consequently redefine their agenda setting goals. Whereas Birkland agrees with Kingdon that "windows of opportunity" can be used strategically in the public interest, he argues that new policy development and policy change are unlikely to occur, without placing emphasis on deriving instrumental, political, and social learning from such occurrences.

## Media Influence

From inception, the news media has been instrumental and influential in agenda setting, with its advantageous capability of disseminating information. From the printing press to radio, television, cable networks, and the Internet, without

replacing earlier methods, the media has progressively increased and expanded its scope for communicating with the public, locally, and internationally. Pocket-size smartphones have most of the features previously offered through personal desk top computers and make it possible to access news in real time. Daily newspapers are accessible through the worldwide web, many with search features that facilitate customization according to individual and specialized interests. The developments in video conferencing software and the immediacy of email are fostering new forms of political motivation and participation.

The extensive reach of the media can command public attention, as well as shape their opinion. Those who study communications have found that the emphasis placed on certain issues by the media can be transferred to the public. For example, frequent reports of crime can promote ideas of insecurity and fear of the threat of crime in communities as pointed out by Maxwell McCombs (2005). Elected officials are also exposed to these kinds of output from the media. In both cases, whether among members of the public or their leaders, the media can influence which issues are selected for governments' agendas. In the last two decades, since the start of the new millennium, increase in the kinds and number of media outlets accommodates the proliferation of all kinds of information that can empower the presentation of contrasting agendas. This scope of influence brings with it ethical responsibilities for the quality and veracity of that information.

Social media play an increasingly important role in facilitating political mobility among individuals and groups. With a growing number of participants, already exceeding millions, the scope for social media platforms to support agenda setting is broad. Following similar practices by other media platforms, social media can influence public perception of the importance of issues they choose to promote by continuously and repeatedly engaging the users on those issues. By doing this, they can also distract users' attention from other issues also worthy of public and government attention. The use of social media is twofold in that the general public may use it to influence the political agenda, while activists, political aspirants, and elected officials can use it to promote their own agenda. Social media as described here also facilitates the transfer of resources and can be used to raise financial support to empower different political interests.

Anecdotal evidence is often powerful in influencing support for different social and political agenda. Social media platforms can be useful in communicating personal experiences and stories aimed to provide evidence in support of specific agendas. Whereas decision-making by elected officials is expected to be influenced by facts, in general, the public may be influenced by readily available, shared stories enhanced by video recordings and framed with selected forms of symbolism that appeal to emotions among individuals and groups. According to McCombs (2005) the media can be successful in telling the public what to think, as well as how to think about it, and raise social and political attention to issues, influencing their attitudes and opinions, simply because they are being covered.

## Public Participation in Decision-Making That Impacts Their Lives

Developments in information and communications technologies (ICTS) continue to support public electronic participation in agenda setting. The willingness of public officials to engage the public in this way has improved in recent years, with their understanding that their readiness to do so reflects their commitment to more inclusive political processes. This manner of public engagement also creates a resource for elected officials toward gaining insight into the issues that inhibit social development and actions that may be taken to enhance it. Support for public participation in agenda setting requires attention to opinions expressed so that participants believe that they are being taken seriously (Warner 2013).

Support for public participation also requires that programs are put in place by public organizations and elected officials to accommodate the kinds of activities that facilitate these interactions. In addition to promoting public participation, the

public may need encouragement, by way of specific types of information that engages them and fosters critical thinking and objectivity. Done in an organized and efficient manner, these efforts are likely to build confidence among constituents to contribute their ideas, as well as offer evaluative feedback on existing policies and related programs. Indeed, these activities need to be monitored in order to inform continuous development and progress with engaging the public.

ICTs also enable public connectivity to political representatives via email, online blogs, and smartphones. Increasingly, elected officials in many parts of the world also maintain websites to keep their public abreast of their political activities, including their actions in parliament. For example, legislation that they sponsor and vote for or against. This contributes to assuring their electorate that their representatives' political agenda reflects the public's needs and expectations. In some cases, if accommodated, members of the public can influence political debates in real time, via text messages to their representatives. This degree of connectivity introduces a level of fluidity to the agenda-setting processes.

## Agenda Blocking

Agenda setting is aimed toward policy change or new policy development and is met by agenda blocking activities by those opposed to proposals for change. K. S. Lawrence (1997) found in the past that success in agenda blocking depends as much on cultural strategies as on resources available to competitors. In the contemporary agenda setting arena, these still apply. Agenda conflicts continue to be regarded as the outcome of competing interpretations of political problems connected to widely held views. Cultural strategies still appeal to positions based on values that are deeply cherished. An example Lawrence gives of this is a group's sense of identity.

Regarding strategies based on available resources, Lawrence separates these into three categories, dependent on low, medium, or high amounts of resources being available. It is his view that defenders of the status quo might choose low-cost strategies, such as denial that there is a problem or refusal to recognize the groups raising the issue. A medium-cost strategy would be, for example, by attacking the issue position or the position of the group initiating the policy proposal. High-cost strategies would involve stronger measures such as law suits and economic boycotts.

Susanna Rance (2004) saw that the recognition of shared values and principles could contribute to building alliances among policy contenders. Her area of study is women's health. She posits that parliamentarians tend to keep pace with a "patriarchally defined agenda," seeking maximum political impact nationally and with their constituents. In Rance's work as a women's health advocate, she holds that the group's approach is based on principles of gender equity, all kinds of social discrimination, racism, and violence. She further states that the values of the group are based on shared principles of "personhood, equality, and respect for diversity." The values as described by Rance conflict with what she discerns as the dominant patriarchal values that influence the policy agenda of parliamentarians. She argues that the influence of shared values can affect agendas by creating unison among advocacy groups and in this way increase their profile in attracting governments' attention, as well as shape the resistance of parliamentarians.

## Conclusions

In summary, agenda setting in contemporary political and social contexts is enhanced by advancements and innovation in the use of modern information and communications technologies and the creative use of mass media and social media platforms. These developments render elected officials and other public sector actors more accountable to those whom they serve. With the awareness of situations that empower agenda setting and expedite related public policy development, the public has more opportunities to influence political agenda and contribute increasing congruence between public and political agenda.

# Agrarian Reforms

Carol Scott Leonard
Institute for regional studies and urban planning NRU HSE, Moscow, Russia
Institute of Social Policy, RANEPA, Moscow, Russia

## Synonyms

Development economics; Land reform; Rural development

## Definitions

| | |
|---|---|
| Land titling | It refers to the component of broad reform assigning formal property rights, where land was previously held informally or worked by customary tenure. |
| Land reform | It refers to introducing laws, regulations, or customs regarding land ownership, most often as a measure led by the government to redistribute agricultural land so that elite landowners or state managers part with some share of their extensive land holdings to allow for the expansion of small individual owners or other rural dwellers. Governments may transfer the land with or without compensation; land registry reform generally accompanies land reform to encourage the land market. |
| Rural development policy | It is the program of measures undertaken by governments to improve rural welfare and agricultural productivity, generally in less developed countries, to increase alternative job opportunities and/or expand production in areas of land-intensive agriculture or forestry. |

## Introduction

Agrarian reform is a grant of substantive freedom, enabling or expanding choice for rural dwellers, who gain rights, or powers, to consume, obtain income from, and transfer landed assets. (This chapter draws on Leonard (2010).) Land titling is a core element of agrarian reform, but, alone, it will not address the constraints of customary land tenure or ensure the development of a land market (Sen 1973; Hoff et al. 1993). Market-led agrarian reform, dominant since the 1990s, is a larger package, including also tax reform and other measures in support of markets (Lahiff et al. 2007; Serova and von Braun 1999). It consists of a multi-instrument design for rural development.

Financial and technological assistance among core measures promotes change through new production techniques and mechanization. Different policies aim at consistency across sectors to diminish a variety of supply-side obstructions where markets are weak. Policies ease financial and other barriers to the exit of households and individuals from a community or region. Multi-

instrument reforms make rural organization sufficiently flexible to release labor and other resources for use in more productive sectors. By definition, a reform that promotes departures from the village, along with productivity improvement, draws on a vision of the future of the entire economy (Mellor 1995). Departures from the village, permitted by improved technologies, reduce costs along the food chain, making the industry more competitive and reducing poverty. The agricultural sector is expected to shrink as its productivity grows during the modernization process, and it increases revenues from exports.

Agrarian reform is one form of industrial policy. Economists model agriculture as a declining sector while the industrial sector leads. As agriculture becomes more productive, it releases labor and fosters industrial development. The path by which agriculture releases labor begins with urban financial institutions making farm credit more widely available, and this increases the demand for the purchase or lease of new technologies in agriculture. Once its capital constraint is relaxed, agriculture improves together with rural incomes, enabling further rural outmigration.

The model of agrarian reform as industrial policy goes back to notions of a dualistic economy in the writings of Friedrich List (1789–1846), who reasoned that protectionist policies would promote "national economies" and the welfare of future generations. After him the concept of a modern and traditional sector – the latter seen as sociologically and technologically backward – became widespread in development theory In the developing world, industrial policy shifts the terms of trade against agriculture, squeezing the agricultural sector to encourage industrialization without causing inflation. This is done by overvalued exchange rates, tariffs on manufactured commodities, and export duties on agricultural commodities to force out a labor contribution from the agricultural sector and to adjust the components of the net surplus flow between sectors. Rural emigration and technological improvement are the instruments of industrial change. The leading sector approach was developed by Lewis (1955) and revised by Ranis and Fei (1966). It follows from the concept of surplus labor from disequilibrium theory, which models the savings constraint on industrialization (Kaldor 1977). A policy that encourages the extraction of labor resources will encourage rural savings and economic surplus from the agricultural sector. Such a policy, as noted above, will contribute to industrialization by lowering food costs and adding to foreign exchange by commodity exports.

In recent years, there has been a move away from this model or any single model for all developing countries. The post-"Washington consensus" policy understanding is that constraints on growth differ among countries and regions. Whether more urban workers promote growth, for example, depends on sectoral differences in rates of return, giving importance to the kind of industry where jobs are being created and to whether peasant migrants have the skills for those jobs. Industrial policy can easily be used to shift the price advantage to industry, but the market rate of return may not justify that investment. To assess this and other country constraints requires highly complex models, including rates of return on investment across the economy, income, and price elasticities of demand for food and the impact of appropriately advanced technologies. Data are required about taxpayers, land boundaries, and future administrative costs. In view of scattered data or developing countries, complicated models can fail to reflect reality (Sah and Stiglitz 2002).

Even if a model could theoretically be designed to reflect completely the constraints in a given country, many policies that might be essential for effective reform are out of reach in the developing world. This is because the set of feasible taxes is extremely limited. Also, the size of the agricultural economy and the extent of poverty may be such that savings across the economy will fail to finance industrial growth. Continued taxation of the agricultural sector in this circumstance will not help because it will prevent the rise in demand for industrial goods. Moreover, since the demand for industrial goods in modern times comes mostly from government investment and services in urban areas, input price support, the standard tool of industrial policy, will not

address effectively the causes of economy-wide backwardness (Gerschenkron 1962). Taxing the agricultural sector will have mixed results.

## Agrarian Reform

Among its modern political appeals, land reform has populist support. In Latin America in the 1960s, for example, many governments introduced agrarian reform to break up latifundia and to create small farms. They targeted large farms as a source of injustice although they also underscored the efficiency of smaller-scale farming, that is, the importance of factor proportionality in agricultural productivity. Governments anticipated that an equitable distribution of land could result in a considerable increase in food production. Reform, it was thought, would induce development and reduce poverty while fostering trade and creating a common market.

At that time, the common experience in land reform of land titling, by itself, and the breaking up of larger farms had an uneven and relatively modest record of results. Farm fragmentation undermined the success of land titling and other reforms in Brazil, Chile, Mexico, Peru, Venezuela, Nicaragua, Guatemala, Zimbabwe, and South Africa. Where fragmentation was avoided, mixed-benefit land-titling reforms were more successful, as in Taiwan, South Korea, and Egypt, where it was not, as in Japan from 1945 to 1950, although carried out by sweeping redistribution, reform failed to deal with farm fragmentation (Waswo 1996).

In the 1950s and 1960s, with mixed results from land titling, technological development in agriculture was given greater prominence by aid agencies as a "green revolution," oriented to new seeds, better farm management, and measured amounts of fertilizers, pesticides, and water. These programs constituted what Vernon Ruttan calls the "high-payoff input model" – based on the insights of Theodore Schultz (Ruttan 2001, p. 186). Technological improvements were labor-intensive, land saving, scale neutral, and efficient in the use of costly capital resources to meet the needs of developing countries. For many reasons, these efforts tended to be insufficient, although there certainly were some countries and regions in which the green revolution produced striking results. The primary drawback was that the new technologies required appropriate institutional settings. Agrarian communities sometimes did not absorb technological innovation. For example, where plots were small and scale-neutral technologies had been imposed, the technologies were ill-adapted to local custom (Griffin 1979). In this model, problems of poverty were generally unaddressed.

A technological focus remains important in rural development theory: technology's vital role in agricultural advancement is well documented by world experience (Binswanger and Ruttan 1978). However, a focus on labor skills and market infrastructure is equally critical. Effective aid, which is tailored to country needs and directed at education, training, and infrastructure, will help mobilize savings for investment in new and/or improved technology. The risk in high-payoff models is that they can leave large farms dominant, with technological innovation held back on small subsistence farms. It also deprives the economy of the benefits of competitiveness that is assured on small as well as large farms, once property rights secure the autonomy of producers. Finally, models too focused on technology can have an undesired ecological impact.

Two country experiences before the 1990s illustrate the importance of timing agrarian reform in a period of economic growth and introducing technological advances in a larger set of multifaceted rural reform measures. The first is South Korea, where in the late 1940s and early 1950s, about 80% of all land farmed under tenancy conditions and land owned by absentee landlords was redistributed, and land titling was completed. In the 1970s, new technologies were fostered in the New Community Movement, which promoted the diversification of production and construction of new roads and bridges and installation of electricity and water supplies. The whole economy grew by about 10% per year between 1965 and 1981, and the rising Gini coefficient for rural household income during this period showed the penetration of entrepreneurship (Kwack 1990, p. 77).

The second example of successful agrarian reform before the 1990s is China. Reform began with decollectivization. Incentives were provided for individual farming through the household responsibility system (HRS), which made the household the residual claimant on the land. Between 1978 and 1989, agricultural output (in constant prices) nearly doubled in gross value of output (de Brauw et al. 2002, p. 26). In China, as in Korea, technological change and non-conventional inputs were promoted: research and extension for improved seed and fertilizers; services, including credit and marketing agencies and cooperatives; and rural governmental resources for building feeder roads and market information infrastructure. Reform has not been a success in all regions of these countries, but in some, farm incomes rose. Food became cheaper, more diverse, and better in quality. Finally, in both countries, incentive-oriented reform was state-led and not associated with the opening of markets, which followed reform. de Brauw, Huang, and Rozelle (2002, p. 26) observe, "Had China led reforms with market liberalization rather than incentive reform, it is unclear that market liberalization would have led to the same gains in agriculture." Timing and a broad focus, along with the state's capacity to implement reform, were critical in these two country examples.

That macroeconomic conditions are crucial, for effective reform can be seen also in the experiences of India, Taiwan, Iran, and Japan. The increased capacity of the agricultural sector is matched by and benefits from the increased capacity of other sectors. When an economy is expanding, by redistributing the land and granting autonomy to producers, agrarian reform relieves producer debt and improves production, while shedding labor in the agricultural sector. By contrast, if a government continues to inject resources into agriculture despite urban employment reaching a maximum, then self-sustaining complementarities end, and support for the agricultural sector is a dead weight on the industry, choking off growth through taxation, as occurred in the Soviet Union after the 1970s. Growth, by definition, is the only means in the long run of reducing rural poverty.

In the period up to the1990s, agrarian reform often failed. Those that were successful tended to rely on a degree of coercion. The relevant historical examples include England and France, where parliaments issued a multitude of new laws to be enforced universally in the establishment of new property rights. In Korea and China, the state was a powerful force behind the initiation of change in rural areas. The use of force or even significant levels of aid, however, does not guarantee that agrarian reform will be successful. Even high-payoff models proved insufficient in the long run for a lasting rural change.

After the end of the Communist regime in Central and Eastern Europe (1989–1991), 23 countries, including 12 successor republics of the former Soviet Union (excluding the Baltic states), began the transition to markets with the common agricultural institutional and organizational heritage of collectivized farming from the 1950s and, in Russia, from the late 1930s. Zvi Lerman (2001, p. 96) describes the nature of the agricultural regime at that time in Central and Eastern Europe:

> . . .most land, regardless of its ownership, was cultivated collectively in large-scale farms that managed thousands of hectares and employed hundreds of member-workers; the commercial production from the collective sector (which included large production cooperatives and state farms) was supplemented by subsistence-oriented individual agriculture based on rural household plots of less than 1 ha.; product markets and input supply channels were largely controlled by state organizations within an administrative command framework; budget constraints virtually did not exist.

These farms were inefficient, with no market information about consumer preferences and no profits, which would have introduced accountability. The imposition of socialist nonmarket structures on previously agrarian market economies was done for the sake of planning and to gain economies of scale, which were quickly exhausted. The result is that farms were deprived of owners with local knowledge and incentives to improve the land and invest in or rent appropriate machinery. Far too large to be competitive, when in the 1990s, these state and collective farms faced competition, along with adverse macroeconomic

conditions, surplus labor, and a drop in demand, they experienced a rapid lasting and deep decline in most countries (Swinnen 2018).

In most of these countries, agrarian reform was introduced both by laws permitting members of the collective to remove their collective shares from the state or collective farm and by the introduction of private ownership of agricultural land, although in most countries some private landholding remained from before the era of collectivization. In Russia, a grant of new rights in 1990 was confirmed by the Russian Constitution of 1993. Restitution and/or some measure of redistribution, accompanying a guarantee of private landownership rights, powerfully contributed to economy-wide transition policy objectives, even in Russia and Ukraine, where regulatory delays stalled the buying and selling of land, and transactions were mainly limited to leasing. Restitution differed among countries. In Hungary, former landowners received value-denominated certificates, and these were used in land auctions. In Estonia and Lithuania, vouchers could be used to purchase even urban land or assets. In Bulgaria, where land was returned to former boundaries, restitution led to farm fragmentation even into non-contiguous parcels and strips (Swinnen 2018). In Russia, after a more than a 70-year lapse in farm ownership, the land was given by large-scale privatization to the collectives and then, with the guide of a new land registry, turned into shares. In Armenia and Georgia, among CIS countries, the land was largely given to individuals, and use rights were turned into individual private ownership.

Across the entire region, large farms downsized in response to the introduction of land and product markets. State farms lost land due to restitution in some countries and through redistribution in others. Over time, the average size of individual holdings across the region has increased, as independent farmers gain profitability and have access to larger plots of land. Large commercially oriented landholding in Russia now shows the buoyant adjustment of farm structures and the labor supply to the market economy (Serova 2020). At the time, during the 1990s, extreme macroeconomic instability during price reform, along with a sectoral impact of industrial restructuring, led to a mixed outlook for agrarian reform in Russia and other post-Soviet states. The dramatic fall in per capita income and cheap and attractive food imports discouraged production. In Russia, the government had to decrease procurement in order to open up new channels of trade, as production stagnated. Association agreements with the EU in 1994 and 1994 brought mitigation in those countries by tariff and trade concessions; membership in the EU by the enlargements of 2004, 2007, and 2013 gave some access to hefty farm subsidies and regional rural development programs under the Common Agricultural Policy (CAP) of the EU. The CAP provided considerable resources, including new supply networks, agricultural extension, vital new services, and rural infrastructure. The differences in agricultural output for EU and non-EU members have declined dramatically over the past 10 years, with accession agreements having harmonized for the latter institutions and policies with the CAP, resulting in enhanced farm viability, competitiveness of the agro-food sector, sustainable management of natural resources, mitigation of the effects of climate, and balanced territorial and economic development of rural areas (Erjavec et al. 2020). In the long run, agrarian reforms also can be counted a marked success in regard to agricultural and economic performance (Serova 2020); Russia is now the top-ranking wheat exporter in the world. To be sure, those left behind in Russia now, as in other advanced countries, are smallholders, without technological resources to compete with agroholdings as the country emerges as a global food superpower (Wegren 2018).

In modern developing countries in other parts of the world, without similar resources and institutional structures, there continues to be no universal template for successful agrarian reform bringing about sustainable rural development. Country differences are paramount in the impact of framework reforms, as they were in the past (Gerschenkron 1962). Complex models and estimates of how the supply will respond to reform measures prove too weakly predictive to be

useful in a practical sense in the developing world (Sah and Stiglitz 2002). The effectiveness of agrarian reform depends greatly on local traditions and historical factors. One example is the slow pace of change in South Africa, where there is little evident impact of agrarian reform on livelihoods and poverty (Waeterloos 2020). The political discourses of equity and land redistribution contrast with elite-biased land use, showing persistent weak state capacity, underfunding, and neglect of poor beneficiaries in the implementation of reform (Scoones et al. 2018). Factors in the success of agrarian reform include, but are not limited to, the way a government approaches the reform process; the adequacy of budgetary resources and their expenditure on reconstruction; the flexibility of available tax instruments; and the macroeconomic conditions in which reforms are begun.

## Conclusion

In sum, effective agrarian reforms are thought to be those that least distort markets, rely on multiple instruments, and aim at sustainable rural development (Koopmans et al. 2018). Such measures will include support for learning, property rights, business plans, and training both for agriculturalists and farmers who choose to leave agriculture. Along with the critically important provision of financial infrastructure, effective reforms will promote aid for self-sustaining improvement in marketing and technologies by means of marketing boards and research and extension. Essential for the provision of public services for agricultural extension, costs soared without showing that new technologies were taken up at the village level. Decentralization of agricultural extension is part of efforts in reform to encourage greater participation of local government in financing and managing these services with the goal of accountability. Governments supporting reform have begun to move institutionally and technically to ensure that farmers themselves manage agricultural extension programs to make them more responsive to local conditions, more effective, and more sustainable.

# Agricultural Government Commercial Company

Jashwini Narayan
Discipline of Management and Public Administration, School of Business and Management, The University of the South Pacific, Suva, Fiji

## Synonyms

Agriculture; Government commercial company; Public sector; Rice industry

## Definitions

**Government Commercial Company**: A 100% government-owned corporatized enterprise that is required to operate purely on commercial objectives.

**Product Differentiation**: Making changes to product to set it apart from competitor products in the marketplace.

**Product diversification**: Modifying current products to add variety or adding new products to the existing line or mix of products.

A

## Introduction

In the field of public administration or public management, the issue of organizational performance has become critical since it is seen as the ultimate goal (Rainey 2003). Providing solutions to the reforming, yet struggling public companies will not only help improve their performance but also greatly enhance the overall public sector portfolio performance of economies. However, certain public companies are resource dependent on other stakeholders. The perusal of literature is indicative of public management scholars paying little attention to the role and importance of resources though (Fernandez and Rainey 2006). The focus of this entry is, thus, the supply and demand situation of an agriculture-based public enterprise – a Government Commercial Company (GCC), namely, Fiji Rice Limited. A GCC is a wholly government-owned corporatized enterprise that is required to operate purely on commercial objectives.

## Fiji Rice Limited

> When the Colonial Sugar Refining (CSR) Company Limited closed its milling operations in 1959, some two thousand families were left with farms that could no longer be worked on in the scale they were originally intended. (Narayan 2016)

The GCC, Fiji Rice Limited (FRL) was initially established in the early 1960s as Rewa Rice Limited when the government of Fiji took over CSR to provide employment to those left unemployed upon CSR closure. At that time, it was "a viable compromise for the farmer" (Narayan 2016). Rice was then introduced as the alternative crop because of unsuitable climatic conditions for sugar cane. While it was a humble beginning, it did bring about genuine appreciation of basic human needs.

FRL established itself as a buyer of paddy from the rice farmers using an emotional approach, helping farmers realize that in addition to earning a living, being a paddy supplier will also restore their self-respect. This sensitive approach proved effective in encouraging the former sugar cane farmers to pioneer Fiji's rice industry (Narayan 2016).

The core functions of FRL are to purchase and mill paddies supplied by the rice farmers and then market the milled rice. FRL buys paddy mostly from the second largest island of Fiji, namely, Vanua Levu and some parts of Viti Levu – the largest island in Fiji. All along, FRL has made continuous effort to encourage farmers to increase rice production which in turn helps Fiji reduce its import bills. Since the late 1990s, FRL underwent different administrations and reforms in order to revitalize the rice industry (Narayan 2016). Despite genuine efforts over the years, it still lacks self-sustainability.

In 1975, Fiji's first retail packing machine was put into place when FRL installed a new rice processing machinery. Subsequently in 1980, FRL made further progress and expanded its operations. In so doing, it set up a modern rice drying and processing mill then (Narayan 2016). Through the establishment of this mill, FRL offered the much needed assistance to farmers of the rice growing belt and the other areas close by. Farmers could use the facilities of FRL and in return sell their paddy to it, to sustain themselves. FRL used to have two mills, one in Vanua Levu and the other in Viti Levu (Narayan 2016). FRL continued with a comprehensive expansion and modernization program a decade later. This involved the construction of a new building, the installation of a fully computerized receiving and weighing machinery with tempering dryers, installation of two new dust extractors, construction of storage silos, installation of conveyor belts, and the replacement of oil-fired driers (The Review 2002: 27). Such changes not only created a cleaner and better work environment but also allowed for speed and efficiency (Narayan 2016). At present FRL has five tempering dryers. Its new mill has 3000 ton milling capacity while the old one mills 1000 tons.

However, the 1993 deregulation of the industry brought with it problems of competition (Singh 1998). The then chairperson who was also a government senator at that time mentioned that even back then, FRL received no preferential treatment despite being government owned. The then Chairperson remarked that they were told otherwise during the 1993 senate. In the 1993 senate, the officials from the Central Planning Office, Ministry of Trade, and the Ministry of Finance assured that interest of the farmers will be unaffected by deregulation. On the contrary, the end result of deregulation was dismal. According to the chairperson, "there [was] hardly any local rice to be milled" (Singh 1998: 26). Faced with poor supply of local rice, FRL then began purchasing rice from overseas for its mill in Viti Levu. This brought with it the problem of foreign exchange losses. Back then at one shipment per month, Fiji spent some $US2.5 million.

As the status of FRL changed to that of a GCC, it changed directions for its survival (Narayan 2016). For instance, in 1997, it decided to do what the bigger companies did. Singh (1998) interviewed the then CEO and discloses the following in his article. FRL began offering other products but to different target markets. It tapped into the wholesale market to distribute a range of grocery items to rural areas to ward off competition and to be at par with competitors. In this regard, FRL opened up wholesale outlets around Fiji in areas that lacked competition. For most wholesalers, these areas were not viable for business. Unlike its competitors, FRL used a profit sharing technique with selected districts, provinces, or whoever's premises they used. The then CEO elaborated on what they did in these areas as follows. Because villagers do not buy in large quantities given their low spending capacity, FRL sold groceries in smaller packs such as milk powder packs of 250g instead of 500g. In addition, FRL transported groceries to small shops to ensure lower selling price. For small shop owners, coming into town to buy items in small quantities and then going back to sell them in villages was not feasible. They lost out on time and ended up with items that had to be sold at higher prices to cover transportation costs. Initially, FRL

purchased eight new trucks to increase its delivery capability to get itself established. However, later it decided to cut back on its fleet to save costs by contracting out deliveries. The then CEO admitted that diversification was needed for survival. FRL was competing with larger rice millers such as the Rice Company of Fiji and Visama Rice Mill who offered better prices to customers. The CEO complained, "we couldn't rely on rice because customers told us our price was too high." If we try matching competitor prices, "then our profit is reduced" (Singh 1998: 26). The CEO explained that the other companies were giving rebates on other items which attracted retailers to buy their rice. FRL's high overhead costs made it difficult for it to compete in terms of price. Diversification helped it regain some of its lost margins. Currently FRL engages in its own distribution directly, from its mill to supermarkets.

All along, FRL remained the rice miller to the farmers until 2017. It then engaged itself in farm projects such as the recent introduction of two new varieties with the assistance of the Ministry of Agriculture and a Chinese technical team. A third variety is currently being tested. The introduced varieties are high in yield. One of the varieties also does not require much water for growth, making it a good option for dry land planting (Pratap 2021). With the assistance of the Fijian Government, FRL continues to engage farmers in conducting pilot projects from land preparation till harvesting (Strategic Plan 2020–2025).

The company particularly focuses on meeting its domestic market demand (Pratap 2021). Its marketing and promotional activities are limited to setting up booths in agricultural and trade shows, radio and TV advertisements, newspaper information, as well as a three-staff sales and marketing team. Its advertisements are largely informational, using the personal testimonial advertisement execution style which shows someone from smart labs, explaining how he gets off insulin after consuming the healthier, more nutritious FRL brown rice. Sales has seen an increasing trend over the years, so much so that FRL is unable to fulfill the current market demand which has led to prioritizing production. The local production caters for around 20 % of national consumption. FRL has about 15 % of market share. While FRL has not conducted any customer survey, supermarkets at times do relay to it, customer enquiries which FRL tries to address (Pratap 2021). It has just purchased a rice flour mill and will begin supplying local rice flour too in the market from April 2021 (Pratap 2021).

The year 2017 marked the year of significant improvements. Rewa Rice was rebranded to FRL in 2017 and since then became part of the Fiji government's "Fijian grown" campaign. FRL attained HACCP certifications for the mill in Vanua Levu and looked into new milling techniques for better rice quality. In this respect, it set a strict paddy grading policy, mostly in terms of moisture levels, foreign seeds, and chemicals to ensure that quality raw materials are supplied to the mill. This remains a challenge since farmers are not always consistent in the quality especially during wet seasons. Policies such as those related to accounting, HR, operations, etc., have been improved also for tighter controls. Mills and machineries have been improved through maintenance, in addition to a new mill in 2017 (Pratap 2021).

The abovementioned and the current qualified team has turned around the company to profitability from 2016 onwards, doubling production levels on farms as well as milling and sales. The company has explored product diversification in terms of par boil rice and may consider this in the near future. Also, by 2017 the company managed to sort our lingering issues of yesteryears and recorded a small profit for the 2016 financial year. It was then when FRL decided to rebrand Rewa Rice to Fiji Rice. There is an obvious ready demand for brown rice and this continues to increase particularly in the larger island of Fiji. FRL rice is available in Australia but through indirect marketing, exported by one of the supermarket customers of FRL. FRL is currently not into exporting given that domestic market demand is yet to be fully catered for (Pratap 2021).

FRL, however, is adversely affected by inconsistent supply of rice paddy; lack of farming

willingness; distant location of mill to markets, resulting in an increasing high cost of freight; high mill cost operations; weak controls and checks of operations; awareness programs; ineffective stakeholder (Agriculture) policy implementation; regional dependence on rice plantation mainly in two areas only; financial dependency on government grant; natural disasters such as cyclones/droughts, aggressive competition; being single-product manufacturer overly dependent on the current local market; other potential millers and suppliers operating at lower cost; insecticides and weeds and; climate change impact (Strategic Plan 2020–2025). Notwithstanding, the company plans to actively market its products in Viti Levu and in the future, plans to also supply to other smaller islands. Export market will thus only be an option once the domestic market demand is fulfilled but that depends on adequate production in Fiji. Nonetheless, FRL is thinking "product diversification" such as products like animal feed from its by-products, "differentiation" highlighting the nutritious aspect of their product, sustainable food security, as well as extending its product line to rice flour (Strategic Plan 2020–2025).

## Suggestions

FRL has sought strategic alliance and in this regard, held a meeting with World Bank, ADB, and Fiji's High Commission in India to look for partnerships (Sharma 2021). It also used to have a strategic alliance with the Rice Company of Fiji for some time (Narayan 2016). The Rice Company of Fiji is a subsidiary of Flour Mills of Fiji (FMF) which is a prominent local rice importer. FMF used the FRL brand "Rewa Rice" as a label on the rice they imported from Thailand. This strategic alliance was meant to facilitate private investment and growth in the rice industry and gave "a new lease of life" to the "Rewa Rice" brand. A problem erupted in this alliance when the Rice Company of Fiji expressed its interest in purchasing the "Rewa Rice" brand name – an offer declined by FRL (Narayan 2016). FRL has met with this company again and its work in progress. Any collaboration will require the shareholder (Government) approval.

FRL can also think of the same with other GCCs like Food Processors Fiji Limited in the area of product diversification such as healthier snacks, cereals from rice such as ricies, rice cereals, and mixed cereals. FRL can also come up with special package deals for hospitals and airlines. It used to have deals for supplies to Fiji Airways in 2018 and prisons in 2017 but prisons began their own farming and milling. For marketing, it can make use of means which may not cost anything or little. For example, create "new-stories" which are not only informative but have greater readability as they appear as news items in the newspapers and reporters are normally interested and in search of stories. Other cheaper advertising means can be local TV programs such as cooking shows, farming shows – these are not really screened as advertisements but captured as TV programs, watched by many.

However, at this point advertisements may not be that needed given the ready demand which FRL is unable to fully cater for, given supply issues. FRL together with the government like the Agriculture ministry and even some international partners can look into improving supply and try to address issues of poor supply and poor quality. RRL is no doubt dependent on its key resource provider – paddy suppliers. Issues like aging farmers, disinterested younger generation need sorting out first. Scholarships in Agricultural studies, help with farm mechanization, subsiding farming-related expenses such as those related to pesticides and looking into transportation issues from the farm to mill; may also need to be considered. FRL is, however, trying to entice new farmers, youth groups, as well as landowners. It does so by engaging in farm projects in Vanua Levu. In this arrangement, FRL gets its team to cultivate the farms where farmers also provide labor. After harvest, the proceeds are given back to the farmer. The idea is to empower them to do the rice farming after the completion of 3 years of engagement. FRL targets idle farms, youth groups, and mataqalis (Fijian clan or landowning unit) (Pratap 2021).

# Alienation and Accountability as Depicted Through Movies

Serena Hoermann
Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Accountability; Criminal justice systems; Hierarchy; Instrumentalization; Law enforcement; Pluralization conflict; Public opinion; Public service; Workforce alienation

## Definitions

Alienation: the state or experience of being isolated from a group or an activity to which one should belong or in which one should be involved; separation from work or self.

Accountability: the fact or condition of being responsible; measurement of a public servant's commitment.

## Introduction

Public servants may suffer from alienation in the workplace, often compounded by their sense of accountability toward superiors, the public, and the organizational mission. Two iconic films illustrate these concepts from organizational theory. Each film employs well-established tropes of their respective eras to provoke a conversation about personal freedom and hierarchy, and alienation versus accountability within corporate organizations and public institutions. *Modern Times* (1936) uses slapstick comedy, while *High Noon* (1952) relies on the drama of the classic Western. The films make a statement about living at the mercy of society and the inevitable march of time. Within this context, each comments on the role of the criminal and justice systems to govern individuals' lives. In both films, the clock – the social construct of time – features as a device to control people. The universality of these themes has likely contributed to the films' enduring place in American pop culture and can assist in understanding key ideas of organizational theory.

## Modern Times

Charlie Chaplin wrote, directed, and starred in the 1936 film, *Modern Times*, the last of his films considered to be "silent" even though the film incorporates some dialog. Chaplin's decision to limit the spoken word at a time when the film industry had abandoned the silent genre in favor of "talkies" is deliberate. Like his beloved character the Little Tramp, Chaplin might be caught up in progress, but would only embrace newer technology as it suited him.

### Hierarchy

Whereas Aristotle argued for citizens taking part in ruling and being ruled, Foucault highlights the segregation between those issuing commands and obeying them, repressing and being repressed. So, too, within the factory setting of *Modern Times*, the hierarchy is a vertical relationship between the CEO and his employees. The factory CEO can watch the entire operation from his office – even

the toilets – and issue commands to increase the pace of the assembly lines to levels that induce physical and mental harm. In the opening scene, herded sheep (among them, one black sheep) foreshadow thousands of factory employees heading to work, and later when factories reopen, thousands of jobseekers. The theme of rulers and being ruled, commands, and repression repeats throughout the film.

### Market Theory and Dehumanization

Thayer disdains economic theory, calling economic competition absurd and dehumanizing in the sense that competition, hierarchy, and alienation relate to and support each other (Catlaw 2008). In keeping with this view, Chaplin's character has no name (as an abbreviation, this text will refer to Chaplin's character as Chaplin) and is simply introduced as "a factory worker." In the factory, an experimental technology purports to feed the worker in a hands-free mode, so they no longer need breaks. The competitive advantage is emphasized. Chaplin is forced to eat faster until the machine malfunctions and attacks him; he cannot escape, and no move is made to free him. When restarted, the machine dumps soup on him, flings soup at him, stuffs him, feeds him spare parts, and slaps him with a pie. The machine is rejected, not because of the injuries, but because the CEO deems it impractical.

If our hero pauses for even a moment on the assembly line, he falls behind and must catch up. When he falls behind, he incurs the wrath of other workers who are also affected, and the line must stop. After lunch the pace increases, and Chaplin cannot keep up. He gets fed into the machine, and when he emerges, he seems to have lost his mind, parodying a ballet and tightening bolts on everything in sight, even the buttons on the women's dresses. He chases a woman until a policeman intervenes. Yet even when chased, Chaplin remembers to punch his timecard.

Taylor's scientific management emphasized efficiency, rationality, structure, and hierarchy to envision the organization as a machine that produces desired outcomes (Farazmand 2002). Symbolic of this, the factory is a massive clockwork. When a colleague falls into the gears, Chaplin attempts to free him. But when the lunch horn sounds, Chaplin takes a break even though the handyman is still trapped. Chaplin feeds the man his lunch. When the break is over and the machinery restarts, the handyman travels further into the machine and is freed. The factory's frenetic drive to increase output and gain competitive advantage leads to absurd and dehumanizing conditions that endanger the workers on multiple levels. Similar charges have been leveled at the trends of globalization and sweeping privatization as a cause of corruption, accountability deficit, and unethical conduct (Farazmand 2002, p. 133).

### Law Enforcement and Criminal Justice Agencies

Professional competence of public servants must be balanced with ethical and sound behavior (Farazmand 2002, p. 129), as when the police must deal with violence or social disorder. When Chaplin's character, now unemployed, wanders into a communist protest march, the police beat back the demonstrators with billy clubs.

Institutional theories serve as models for public organization of government functions, such as judicial and bureaucratic systems, and economic markets; they emphasize structure, process and rationality, and values, such as the rational instrumentalization of bureaucrats to serve organizational goals; bureaucrats serve to ensure efficiency (Farazmand 2002). When the protagonist is mistaken for the protest leader, he is arrested and sent to jail. Similar to the factory, the prison has its rules of conformity. The prisoners are whistled to march into their cells, dress identically, and follow the schedule. However, when pardoned, Chaplin does not want to leave prison because he finds it peaceful after his nervous breakdown and release into the stress of society. Institutionalization via the law and judicial institutions has changed him. However, he gains employment in a department store, is caught up again in criminal activity, again fired, imprisoned, and released. The cycle of employment-imprisonment catch-and-release mirrors the gears of the factory, relentlessly processing people, and its dehumanizing aspects. In a similar

vein, the so-called school to prison pipeline is a phenomenon primarily affecting children with learning disabilities or histories of poverty, abuse, or neglect well-documented by the American Civil Liberties Union (https://www.aclu.org/issues/juvenile-justice/school-prison-pipeline).

Examining the 1950s classic western film *High Noon* illuminates additional concepts of alienation and accountability.

## High Noon

The film *High Noon,* directed by Fred Zimmerman in 1952, demonstrates issues around public service and accountability. Watching the film in 2020, the public administration scholar questions the role of law enforcement and the justice system, as Americans protest the death of George Floyd (and many other Black citizens killed by police officers) and calls for defunding the police. An alternative to the ideal type bureaucrat, pluralization, and public opinion can all be found in the film. And a public meeting highlights accountability-diminishing tactics.

### The Public Servant, Weber, and Marx

On the surface, *High Noon* depicts a faceoff between the law and the criminal: at noon a convicted but pardoned criminal will arrive in town to find and kill the marshal who arrested him. On a deeper level, the film portrays a man's struggle with his sense of duty to serve and protect a largely uncaring public, the lonely burden of wearing the badge, and self-preservation.

This public servant does not enjoy the social esteem of a social position guaranteed by rules and conventions (Weber 1946, p. 7). Even though the bureaucrat relies upon tenure for life (Weber 1946), the bureaucratic, scientific management, and systems theories portray an adversarial relationship between organizations, society, and the individual – each pursues its own interests in a rational manner, seeking stability and self-preservation (Farazmand 2002).

The film opens with theme song lyrics, "Do Not Forsake Me" that describes facing the villain and facing fear. With this musical backdrop, three cowboys gather and ride into town. The town reacts with anxiety – a woman crosses herself and others hide. The viewer understands that the bad guys have arrived. A church bell announces the wedding of Will and Amy Cain. Just as Will turns in his badge to retire from his post as marshal, the telegraph man brings the news that Frank Miller has been pardoned and his gang is waiting for him to arrive on the noon train. As Marx (1967) observed, although the individual can align with organizational goals and attain success within the framework, the rewards system will favor those who conform and reinforce the structure; in fact, the upper echelon and the lower ranks practice mutual deception to preserve the organization. In this scenario, the judge "up north" undid the work of the local public servant who brought a criminal to justice, a conflict between competing agencies of law enforcement and judiciary. And Will Cain must reinforce the structure he swore to serve, even at the cost of his life. A dramatic overhead shot in one of the film's final scenes shows Will in the deserted main street walking to face the men. The ex-marshal who returned to protect the town must face the threat alone.

### Law Enforcement and Criminal Justice Agencies

As in *Modern Times*, the film *High Noon* portrays varying degrees of effectiveness and alignment within and among law and judicial agencies. Compared with the (ex-)marshal, public servants in *High Noon* have less commitment to their jobs. Will appeals to the local judge for advice, but the judge says, "You shouldn't have come back." The judge "gives Will a civics lesson," telling Will the townspeople will not support him and reminding him that the villain swore revenge. The judge tells Will the town does not matter, and Will is wasting his time and his life. Meanwhile, the police force is internally conflicted. Will's young deputy Harv wants the marshal's job, but Will does not feel he is ready. So, the deputy quits.

A retired lawman proves to be a disappointing mentor to Will, complaining that cops arrest people and judges set them free to shoot at cops again. He asks, "For what? A tin star. It's all for nothing."

Will says he cannot round up deputies and the old cop replies, "Maybe they just don't care. I was hoping you wouldn't come back." Referring to Frank Miller, Will counters that sometimes prison changes a man. No, the older man replies – not Miller, you should get out. Will asks, "Will you come to the train depot with me?" The old lawman demurs, he would not be helpful and that would endanger Will, who would worry about him. After this exchange, ex-deputy Harv sees the marshal go into the barn for a horse. They fight, and Will knocks Harv unconscious. Finally, the single remaining volunteer deputy, seeing it is just the two of them, bails out. As the clock ticks down its final minutes until noon, Will composes a letter to be opened in case of his death and lets the prisoner out of his cell.

## Public Opinion, Pluralization Conflict, and Accountability

Trained administrators "have to recognize an intellectually developed, educated, and freely moving 'public opinion'" (Weber 1946, pp. 8–9), and Will has a multitude of voices with which to contend. Democratic institutions are meant to be responsive to the wishes of the public; however, the public may support inconsistent goals, forcing leaders to make policy decisions on their own (Peters 2010, pp. 209–210). At the beginning of the movie, everyone in town, including friends and enemies, think Will and Amy Cain should leave town quickly to avoid the showdown, and the wedding guests send off the couple to enjoy their honeymoon. However, Will is convinced he must face his nemesis. Amy urges Will not to be a hero, but Will argues the criminals will follow them wherever they go. Amy threatens to leave town on the noon train without him; she takes the carriage and goes to the station. Although retired, Will still feels a great responsibility to protect the town and puts the public good above his personal safety and domestic tranquility.

While *High Noon's* setting of the Old West provides a simplified version of conflicts between public agencies, public opinion, and privatization, and the debate among townspeople in the church depicts how legislators, bureaucrats, and the public grapple with high-risk scenarios. The pluralization dynamic occurs when the diversity of bureaucracies and scarcity of resources combine to create interagency conflict and institutional rivalry (Goodsell 1983).

Additionally, six types of accountability-diminishing tactics (Durant 2010) by the townspeople challenge Will as the public servant: (1) altering the definition of the issues at hand to the one's advantage (issue [re]framing); (2) questioning the legitimacy of [administrators] to act (delegitimation); (3) rallying allies and demobilizing opponents (mobilization and demobilization); (4) reducing the capacity of [administrators] to take action (deinstitutionalization); (5) reducing the transparency of its operations (opacity); and (6) (re)packaging data on its operations to advance a campaign for [administrative] relief (data manipulation).

The debate in the church, which serves a public meeting, demonstrates the townspeople employing the above ideas and tactics diminishing accountability, while others support the public servant's authority and autonomy. Will enters the church, disturbing the service and asking for volunteers (privatization). At first, many step forward. But one person tells them Will is no longer the marshal, and the matter is personal between Will and Frank (reframing). Another man argues the politicians up north pardoned Miller, and they should deal with it (interagency conflict). A third says they pay for a marshal and deputies, and the police should deal with it; yet another says they need more deputies, and if they had hired them, the town would not be facing the crisis now (scarcity of resources). A sixth man says Will was the best marshal they had ever had, and they should support him. "Why didn't you arrest them?" asks someone else. "They haven't done anything wrong," Will replies. A woman says that when Frank Miller's gang ran the town, you could not safely walk the streets. Another person is in denial – will Frank really be on the train? The parson equivocates, quoting the Bible "Thou shall not kill" but acknowledging the need to hire others to do it; he cannot tell his congregation whether they should join the fight to kill Miller (inconsistent goals). If people up north read about shooting in the streets, they will not

invest in the town and that will set us back 5 years (reframing).

Additional statements in the church illustrate the kind of public and legislative debate that leads to no action taken. They include: "It's our problem because it's our town, we have to do what it is needed and be brave." "Will is brave, he came back, but I wish he hadn't." "If Will were gone, Frank would not come back." The new marshal should deal with it, Will should go. In the end, Will says thank you and leaves with no support. The debate inside the church echoes the group of kids outside the church playing tug-of-war.

In a surprising, women-empowering happy ending, the hero Will Cain – supported by his young bride – defeats the villain Frank Miller. His alienation complete and accountability fulfilled, Will drops his badge on the ground, and the Cains leave town.

## Concluding Thoughts

Neither the slapstick comedy *Modern Times* nor the Western drama *High Noon* pretends to be a realistic depiction of bureaucratic institutions; however, each demonstrates a few important concepts from organizational theory. *Modern Times* depicts the instrumentalization of individuals within hierarchies that leads to dehumanization and alienation from self and work. *High Noon* showcases a public servant withdrawn from self and his role within the public agency, conflicted by public debate and accountability until he leaves his post.

# Alternative Marketing Strategies in Nonprofit Organizations

Barry D. Friedman
University of North Georgia, Dahlonega, GA, USA

## Synonyms

Conducting outreach via online technologies; Entrepreneurship; Innovation; Networking

## Definition

Modern approaches to exploit technological, Internet-based communication and networking methods; building capacity; and increasing revenue.

## Introduction

The entry ▶ "Marketing in Nonprofit Organizations" in this encyclopedia describes the marketing function in general terms. This entry discusses less traditional and more entrepreneurial approaches to making a nonprofit organization more competitive and financially sound. The approach of alternative marketing strategy takes advantage of twenty-first century technology, such as social media, and emphasizes innovation and adaptation to the modern environment.

This description of alternative marketing strategies will discuss new technological approaches

to reaching consumers in cyberspace, modern methods of fund-raising, nonprofits' creation of commercial enterprises, joint ventures, investments, and other alternative means of raising revenue and surviving in a competitive environment.

## Alternative Marketing Approaches

Khankaew et al. (2015) describe six cutting-edge approaches to alternative marketing. They are:

- *Expeditionary marketing*. This approach focuses on being a market leader through innovation.
- *Guerrilla marketing*. This approach focuses on the use of low-cost communication methods and strategic reliance on collaboration and networking.
- *Radical marketing*. This approach focuses on effective use of market research that facilitates extensive understanding of customer behavior and preferences.
- *Buzz marketing*. This approach focuses on information exchange through social networks to engage customers.
- *Viral marketing*. This approach takes advantage of economical communication through e-mail and online advertising.
- *Convergence marketing*. This approach recognizes modern consumer involvement as being a hybrid between being relatively passive receivers of products at neighborhood retail stores and being fully participatory online decision-makers who "name your own price," use a "name-your-price tool," and enter an acceptable price in an auction.

## Using Digital Applications

Buzz marketing and viral marketing use Web 2.0 applications – the social media capabilities of YouTube, Facebook, and Twitter – to reach the extensive audience that exchanges messages at a brisk rate and can transform what is obscure into what is prominent. Hausmann describes how arts institutions in Germany – including the Bavarian State Opera of Munich, the State Ballet of Berlin, the Duisburg Philharmonic Orchestra, the Städel Museum of Frankfurt, the Museum Folkwang of Essen, and the NRW-Forum of Duesseldorf – are now accomplishing their marketing objectives with social media. Hausmann adds that social networking sites allow for the presentation of videos that "materialize the intangible acoustic and/or visual cultural experience and. . .emotionally activate the user. . ." (Hausmann 2012).

Guerrilla-marketing expert Jay Conrad Levinson lists a number of e-media "guerrilla" tactics that nonprofit organizations can use. These tactics include the use of social media, participation in forums and chat rooms, posts on Internet bulletin boards, generation of personalized e-mail, uploading of a Web site, use of a merchant account, insertion of a shopping cart feature on the Web site, maintenance of a blog, use of podcasting, publication of a personal e-zine, publication of e-books, the offer of Webinars, and an arrangement for the appearance of pay-per-click ads (Levinson et al. 2010).

For several years, Amnesty International's Norwegian affiliate has been using online software to encourage supporters to sign e-petitions on behalf of political prisoners. The organization engages an estimated total of 55,000 supporters through its use of Facebook, Twitter, and YouTube, as well as its Web site, which was overhauled to stimulate two-way communication between the organization and its members in 2010.

## Strategic Fund-Raising

Even if their managers are not supposed to be profit-oriented, nonprofit organizations have the same need for revenue as do for-profit firms. Raising revenue is an ongoing challenge; the competition for financial resources is frantic. Many observers in the United States recall how President Ronald Reagan's policies included severe cutbacks in grant and subsidy programs through which the US national government had provided support to nonprofits, especially from the 1960s to the early 1980s.

Beyond the traditional forms of fund-raising, such as direct-mail solicitation, collections of membership dues, and advertising, charities can engage in episodic (short-term) fund-raising activities, including raffles, canvassing, and gatherings. In the United States, the Muscular Dystrophy Association, led for many years by comedian Jerry Lewis, was the most successful user of the telethon device, which brought in $65 million at its peak in 2008.

The central rallying point of a nonprofit's fund-raising can be its "annual fund" effort. The "annual fund" is a methodical outreach to prospective donors, sometimes at a specific time of each year. A charity can use such themes as fund-raising goals, collective targeting to specific groups, and recognition of donations at various levels.

Few nonprofits will be able to cover their expenses through the collection of small donations. Generally, large donations from individuals capable of giving them are necessary if the organization is to be able to fund its programs and cover its fixed expenses and payroll. The experience of many organizations follows Pareto's 80/20 rule: In this context, 80% of donations come from 20% of the donors. Modern charitable fund-raising emphasizes the approach of *development*. This approach seeks to develop recurring relationships with donors, especially affluent individuals who can provide significant support worthy of prominent recognition. The development of such relationships often relies on the approach of *exchange*: The charity provides the donor something of tangible or intangible value in exchange for the donation. The charity might offer a tote bag, a T-shirt, a calendar, or some other item on which the organization's logo appears. In the case of large donations, the exchange may involve the donor's name being inscribed on a plaque or a room or building named for the donor.

A modern approach to fund-raising is online "crowdfunding." Flamenco Australia organized a Flamenco Festival in Hobart, capital of the -Australian island state of Tasmania, in 2013. The organization obtained A$3520 through the crowdfunding site Pozible. The crowdfunding proceeds along with entrance fees allowed Flamenco Australia to self-fund the entire event that featured Spanish music, dance, and culture. A similar approach, Sina Weibo's Micro Commonweal (*Wei gongyi*) software, was used by the Wuhan Member Group of the Friends of Nature and the Green Beagle Environment Institute of Beijing, China, to raise RMB 30,000 Yuan (equivalent to US$5000) online to purchase a portable monitor to measure Shanghai's level of $PM_{2.5}$ – air-pollution particles less than 2.5 μm in diameter – in the air. The successful campaign seemed to be the impetus for the Shenzhen Chinaway Environmental Technology Co., Ltd., to proceed to donate *100* portable $PM_{2.5}$ detectors for use by nonprofits and journalists. The equipment has been instrumental in getting China's government to address the country's pollution crisis.

## Solicitation of Grants

Insofar as many nonprofits are not self-sufficient financially, because they provide goods or services at below-market prices or for free, they require resources from other nonprofits, such as foundations, or from entities in the government and for-profit sector. Therefore, they often turn to other entities, some of which structure their philanthropy through grant programs. Many such grant programs are competitive in nature, require the applicants to justify the request and provide convincing evidence of their worthiness in terms of such bases as values and commitment, and then demand convincing evidence of successful results. As a trend, grant benefactors expect grant recipients to self-fund at least some of their program expenses through earned-income ventures.

When an agency or foundation announces (in a "call for proposals") the opportunity for nonprofits to apply for a grant, an industrious nonprofit can enter the competition. Clear writing that suggests that the organization has a vision and a viable plan can attract a favorable response. Francois suggests this sequence of section headings for a grant application:

- Cover page
- Table of contents
- Abstract
- Problem or needs statement
- Goals and objectives
- Project description or activities
- Timeline
- Organizational capability
- Evaluation
- References cited
- Budget
- Budget narrative
- Appendices (Francois 2015)

## Competition with Commercial Enterprises

Nonprofit organizations have the option of offering for sale goods and services that are not particularly distinguishable from goods and services offered by for-profit firms. Such nonprofit institutions as hospitals, day-care centers, research facilities, multiunit housing, and theaters are not easily distinguishable from similar for-profit enterprises.

In the United States, the small-business community has objected to the nonprofit sector's encroachment on its turf. A 1990 report of the US Small Business Administration cited competition between nonprofits and for-profits in traditional service industries such as merchandise sales, health care, travel, laboratory testing, audiovisual services, engineering consulting, and data processing.

An example of what was a nonprofit organization that realized surpluses is the Blue Cross and Blue Shield insurance plans in the United States. While their for-profit competitors distribute part of their profits to shareholders, the nonprofit Blue plans did not distribute surpluses except in the form of lower subscription rates. Until 1986, Blue Cross and Blue Shield were covered by Section 501(c)(4) of the Internal Revenue Code. Pursuant to that section, the Blue plans were exempt from paying taxes but contributions to them would not constitute an income tax deduction for donors. The history of Blue Cross and Blue Shield accounted for their 501(c)(4) eligibility. The way for their creation was paved by the existence of small, voluntary plans for prepaid medical expenses, the largest such plan founded in 1929 by Baylor University Vice President Justin Ford Kimball, in response to his observation that a large proportion of debts that went bad at Baylor's medical facilities was associated with local schoolteachers.

Profit-making insurers had so much difficulty competing with Blue Cross given its advantages as a nonprofit organization that, for this and other reasons, many threw in the towel in the health-insurance field. However, state governments became increasingly eager to regulate the Blue plans and Blue Cross association executives came to regard the 501(c)(4) status to be a straitjacket that forced them to offer universal eligibility and be overly flexible in their underwriting. Finally, the US Congress converted the Blue plans' status from 501(c)(4) to 501(m) in the Tax Reform Act of 1986. The Blue plans' tax exemption was scaled back, although some remnants remain in place.

Other prominent examples of nonprofit organizations presenting formidable competition to for-profit firms include the American Red Cross and Underwriters Laboratory. The blood-transfusion market was dominated by for-profit blood banks that paid donors for their blood until the mid-twentieth century, when the ARC – emerging from a successful World War II effort to provide blood for US military personnel – entered the civilian marketplace in 1948. In order to improve its competitive position, the ARC proceeded to denigrate the use of paid blood. In the 1970s, the ARC agitated for regulation by the federal government to drive for-profit banks that paid for blood out of the market. The ARC has insisted that blood from unpaid donors is safer than blood from paid providers. "Under no circumstances will the Red Cross pay blood donors," the ARC declared on its Web site. "Donors who give blood for reasons other than benevolence could potentially compromise the safety of the blood supply."

Blood banks that paid people to donate blood repeatedly insisted that there was inconclusive evidence that volunteer blood was safer than

paid blood; in fact, those blood banks warned that there was more danger associated with a shortage of blood. However, the repeated insinuations by the Red Cross that volunteer blood is safer than paid blood put the paid blood banks on the defensive and undermined public confidence in them, and most of them disappeared because they could not compete successfully in the hostile environment that ARC had created for them.

Underwriters Laboratories (now known as UL LLC) is an entity that, since 1894, has tested electrical equipment and evaluated whether it should be certified as being safe. For-profit laboratories strenuously objected to UL's nonprofit status for years, stating that UL's operations could scarcely be differentiated from what the for-profit laboratories did. According to UL, its mark appears on 22,000 types of products worldwide.

Nonprofit organizations' sale of goods and services in competition with the for-profit sector is an ongoing source of resentment by for-profit firms. Small businesses in the United States have been particularly vocal about what they perceive as unfair competition. The for-profit business people's objections center on nonprofits' exemption from an array of national, state, and local taxes and charities' acceptance of tax-deductible donations. If, at one and the same time, the Keebler Company and the Girl Scouts of the USA organization are selling cookies, Keebler must pay taxes on its profits, on its real estate, and on its payroll, and consumers pay state sales tax upon purchasing the cookies at a store, while the GSUSA pays no income or real-estate tax, has a limited payroll because most of the labor is voluntary, and in most states is not required to collect and remit state sales tax. For-profit firms complain that, under circumstances like that one, they approach the marketplace at a significant disadvantage. They characterize the tax advantages of nonprofits engaging in similar competition as, essentially, a subsidy granted to the nonprofits by government policy and, therefore, they perceive that, for all intents and purposes, they are competing with the government itself.

For-profit firms object that nonprofit organizations, as they present such competition and enjoy such tax advantages, are relatively unregulated. State governments have few instrumentalities to determine whether nonprofits are operating in ways that public policy intends. The major source of nonprofit-sector regulation in the United States is the US Internal Revenue Service's Exempt Organizations Division, whose staff is not large enough to be able to monitor hundreds of thousands of organizations vigilantly. State taxation agencies carry out limited oversight on nonprofits' compliance with tax-exemption requirements. State laws pertaining to the creation and operation of corporations, including those that are nonprofit, impose general obligations on their leadership and managers. More specialized regulation is industry specific, as in the case of federal and state laws and rules that pertain to all health care organizations.

For-profit owners and managers conclude, therefore, that the competition from nonprofit organizations is unreasonable and unrelated to any original intention that society had in recognizing the category of nonprofit organization. In expressing its objection to tax-exempt competition from nonprofits, the US Small Business Administration (SBA) has asserted on behalf of small-business owners that the tax laws must draw a distinction between the related commercial activities of charitable organizations – such as the American Red Cross and the Salvation Army – and commercial nonprofits whose revenues are predominantly fee based, which collect only modest amounts of donations, and which differ from for-profit service providers only on governance structure. For-profit hospitals, daycare centers, nursing homes, research institutes, and publishers resent competition from nonprofit organizations that offer the same commercial services.

Nonprofit arts and cultural organizations have struggled in recent years because of cutbacks in government support and numerous entertainment alternatives. For many decades, marketing experts have urged such organizations to adopt marketing principles and practices, to become more consumer oriented by embracing the marketing concept, and to learn about their audiences and meet their needs more than others do.

## "Unrelated" Enterprises

While it is within the range of options for a nonprofit organization to set up an enterprise not directly related to its core mission, so that it can obtain revenue from that "unrelated" enterprise, the entirety of the net revenue from that enterprise is likely to be potentially subject to corporate income taxation. US income tax law prescribes three tests that establish an enterprise as being "unrelated": the activity is "a trade or business," it is "regularly carried on," and it is not related to the tax-exempt organization's program purposes.

The US Internal Revenue Code and the Internal Revenue Service (IRS) consider a tax-exempt organization to be a collection of segments, each of which must be evaluated with respect to the organization's exempt purpose. In accordance with the *fragmentation rule*, the IRS examines each activity to evaluate whether it is an "unrelated" enterprise. For example, the IRS will acknowledge an educational organization's publication of a journal to be covered by tax exemption but will require that income tax be paid on sales of advertising in that journal. Similarly, the IRS will concede that sales in a museum's gift shop of items reflecting the museum's collection are exempt from income tax but will consider sales of souvenirs reminiscent of the surrounding city to be taxable.

A nonprofit organization may establish an unrelated enterprise, structuring it as a for-profit entity and paying dividends. An example would be a nonprofit research laboratory that creates a subsidiary to hold its employees' patents and gives the employees ownership shares so that they can reap rewards from royalties and other fees.

Naturally, the national tax laws that pertain to nonprofit organizations vary around the world, and the inevitable complexity of such laws eliminates any possibility of uniformity from one country to another. The US Internal Revenue Code is generous to charities. Some developing countries' legislatures have yet to enact laws offering tax advantages to charities. In the United Kingdom, nonprofits may conduct commercial activities only through a for-profit subsidiary that transfers its revenues back to the nonprofit without any payment of tax. Canada's stringent laws do not allow nonprofits to conduct unrelated, surplus-generating commercial activities. Nonprofits in India stand to forfeit their tax-exempt status if they earn revenue from unrelated commercial activities. Etchart and Comolli analyzed laws and regulations in the Latin American nations of Argentina, Brazil, Chile, Ecuador, and Peru. Argentina exempts from taxation income only from mission-related activities. In Brazil, charities' commercial-activity revenues are rarely taxed. Chile exempts revenues from only mission-related activities for only welfare organizations that have obtained exemption from the nation's president. Ecuador exempts charities' commercial-activity revenues as long as the revenues are reinvested within 1 year. Peru exempts commercial-activity revenue of nonprofits organized for charity, social assistance, education, culture, science, art, literature, athletics, politics, unions, and housing as long as the revenue is directed to a social purpose (Etchart and Comolli 2013).

Any nonprofit organization's leadership that wishes to establish such an enterprise should form a planning team – which may include the executive director, other top managers, and board members – and may wish to get help from a consultant in order to develop a business plan. La Piana, Gowdy, Olmstead-Rose, and Copen suggest the following elements of the plan.

- A description of the organization's mission
- A discussion of the program's or organization's history, business model, and focus
- A market analysis
- A description of the organization's governance, management, staffing, and operations
- A description of collaborative relationships
- A description of contemplated promotional and outreach approaches
- Financial projections and a plan for fund development
- A plan for the evaluation of the program's impact
- Identification of risks and description of approaches to risk mitigation (2012)

## Program-Related Enterprises

Money-raising activities of a nonprofit organization will normally be exempt from income tax if the activities are reasonably related to the organization's core purpose. Here are some categorical examples of related enterprises, in accordance with US tax laws and other countries' laws:

- *Enterprises that serve the day-to-day needs of patrons*. Universities operate bookstores, sell housing and meals, perform contract research and testing, and operate publishing houses. Student-identity cards issued by the City University of Hong Kong provide admission to the university's canteen and bookshops. In Great Britain, the Scout Association operates Scout Shops Ltd. that sells uniforms, other clothing, equipment, and publications, proceeds from which benefit the scouting movement.
- *Enterprises that serve the interests of patrons and visitors*. A museum's gift shop can sell reproductions, posters, and tote bags on-site and have a Web site or mail-order catalogue. Retail businesses, such as gift shops, bookstores, and restaurants, reach nonprofit institutions' clientele and can be staffed by volunteers. In New York City, the Metropolitan Museum of Art's gift shop and the New York City Ballet's Gift Bar have produced significant revenue for those institutions. At the Smithsonian Institution in Washington, D. C., food and beverage sales are similarly productive. Parking lots generate revenue for museums and symphony halls. New York City's Museum of Natural History and the American Jewish Congress organize tours and trips for members, students, and other customers.
- *Publications whose content is reflective of the organization's theme*. The Association of Junior Leagues International, Inc., has nearly 300 affiliated leagues in Canada, Mexico, the United Kingdom, and the United States. The association, says its Web site, "is an organization of women committed to promoting voluntarism, developing the potential of women and improving communities through the effective action and leadership of trained volunteers. Its purpose is exclusively educational and charitable." Chapters have raised money by compiling and selling celebrated cookbooks that they compile locally in accordance with local cuisine. Environmental, conservation, and cultural organizations gravitate toward publications, such as the Sierra Club, whose calendars and books depict natural wonders, and the National Geographic Society and New York City's Museum of Natural History, which publish magazines.
- *Government enterprises that serve the needs of residents*. Utilities operated by state and local governments are exempt from the corporate income tax.
- *Short-term enterprises, though the activity itself is not related to the organization's core purpose*. An enterprise of a nonprofit organization will be considered an "unrelated" enterprise only if the activity is "regularly carried on" by it. For example, if a veterans' service charity were to sell hamburgers at a stand during a 2-week-long exposition, then that is not considered a regularly operated enterprise. One-time fund-raising activities such as a dance or a concert are "unrelated" as well.
- *Ventures in which "nonprofits that offer therapeutic and rehabilitative assistance to their clientele…combine training with enterprise activity."* These programs are called *sheltered workshops*. In these workshops, nonprofits' clients "carve decorative wooden clocks in Florida; produce pickles, mustard, and ketchup in Rhode Island; raise feeder pigs in upstate New York; and operate a recycling center in Seattle." What kind of work will be performed in a workshop is determined by workers' needs and abilities, the paid- and volunteer-staff members' skills, and the surrounding communities' needs (Crimmins and Kiel 1990, p. 319). Skloot reports that few of such workshops bring in much revenue "[d]ue to their large social service and training components…." The workshops operated by Goodwill Industries International, the Salvation Army, and the Volunteers of America have been most successful (Skloot 1988, p. 5).

- *Manufacture, distribution, and sale of program-related goods and services*. Nonprofits may design goods related to their mission, and their brand can propel sales. For example, the Planned Parenthood Federation of America sold its "house-brand" condoms to affiliates and clinics. The American Red Cross and many local blood centers sell fractionated blood products. Minnesota Public Radio sold apparel related to the *A Prairie Home Companion* radio program.
- *Enterprises that are suited to the volunteer labor of members and the reselling of in-kind donations*. For 100 years, the Girl Scouts of the United States of America have sold cookies as a fund-raiser. The IRS does not tax the revenue because the scouts are considered to be learning responsibility and professionalism while organizing their cookie sales. A trade or business that resells merchandise received as gifts or contributions, such as a "thrift store," is tax-exempt.

## Licensing

Soft property, often known as "intellectual property," includes such property as copyrights, patents, trademarks, and artwork. These assets can be prolific sources of revenue. For example, the Children's Television Workshop, which created the very successful, enduring *Sesame Street* show for the US Public Broadcasting System, has licensed *Sesame Street* characters for use in musical recordings, toys, and books produced by for-profit firms, earning many millions of dollars in the process. The National Wildlife Federation, headquartered in Reston, Va., has licensed the Ranger Rick character for adaptation by for-profit firms. These kinds of soft property are a form of "goodwill" that has remunerative value for the nonprofit and profitable potential for corporations in the for-profit sector.

London's Royal Opera House, The Royal Ballet, and The Royal Opera have made their brands available for licensing to such retailers as the Boodles jewelry store, the Pepper & Mayne woman's-wear label, the Calken Gallery, Carlton Books, and the Cocorose London designer of shoes and accessories.

The matter of licensing is intertwined with the matter of the organization's *brand*. The brand includes the organization's logos, other symbols, and mottos and slogans. It also includes the organization's reputation in its market and in the wider community. A prominent and admired brand is a valuable asset for a nonprofit organization. It behooves every manager and employee in a nonprofit organization to protect the brand and, in the course of interactions with clients and others, to enhance the regard that stakeholders feel for the organization.

## Joint Ventures and Contracting

Nonprofit organizations create valuable connections and raise badly needed revenue through their partnerships with for-profit and nonprofit organizations and governments. For example, two nonprofits in Dakota County, Minn. – one called 360 Communities and the other known as Vineyard Community Services – agreed in 2013 to work together to address the needs of the county's 28,000 impoverished families by ensuring the operation of a fully stocked food bank. IKEA, the multinational furniture and home-accessories conglomerate designed in Sweden and headquartered in the Netherlands, established a partnership with Save the Children in 1994 to accomplish the elimination of child labor from products entering IKEA's supply chain. The IKEA Foundation has invested large amounts of donations in Save the Children's programs to combat child abuse and poverty.

Nonprofits also provide a variety of services to for-profit firms, as in the case of Family Service America that has provided drug and alcohol counseling to employees of General Motors. Universities conduct long-term research studies under contracts with for-profit corporations. The governments of Fairfax County, Va., and of the cities

of Fairfax and Falls Church, Va., operate the Fairfax-Falls Church Community Partnership to Prevent and End Homelessness. The partnership includes 15 nonprofits, all of which enter information about homeless families into a county-wide Homeless Management Information System (HMIS) operated by the local governments through which aid to affected families can be coordinated.

In Britain, during the Queen's Golden Jubilee in 2002, Barnardo's, a British children's charity dating to 1866, ran a Golden Jubilee campaign, partnering with Procter & Gamble. Donors received discounts on P&G household products, while Barnardo's reportedly received from P&G a benefit of £150,000.

## Renting Out of Unused Capacity

Many nonprofits have capacity – facilities, equipment, technology, and employees – whose size is intended to satisfy its needs at peak times of the week or year. For example, a church building may be bustling with activity on Sunday morning but may be all but abandoned on other days of the week. This circumstance, which is often unavoidable, presents the opportunity for such organizations to rent out their unused capacity at off-peak times for them. Such opportunities may include these examples:

- Renting rooms in a building to other organizations for their meetings when the building would otherwise be unoccupied.
- Hosting a convention, adult-educational program, or other gathering and accommodating attendees in otherwise unoccupied classroom buildings, dormitories, residences, dining facilities, etc.
- Renting school sports stadiums to professional or adult sports leagues.
- Leasing space on a university campus to start-up firms, as the Rensselaer Polytechnic Institute in Troy, N. Y., has done in order to "incubate" technology firms.
- Renting unused technology, as in the case of New York City's Public Broadcasting System affiliate, WNET, that makes its production services available to clients.
- Making employees available to consult with other organizations that are short on expertise relative to technology, managerial methods, and operations.
- Leasing out portions of facilities that are currently unneeded by the organization but useful to others.

## Investments

Passive investment income – including dividends, interest, rents, and royalties – of nonprofits is ordinarily exempt from taxation. The rule that "unrelated" enterprises are subject to income tax relates to *active* businesses, not to passive investments.

The endowment funds of prestigious universities are munificently funded. In 2016, Harvard University's endowment, the largest in the world, was approaching the $40-billion mark. Such funds are invested in corporate stocks and bonds, real estate, and other assets. The resulting dividends, capital gains, and rents go untaxed.

## Conclusion

For nonprofit organizations that find themselves in a fierce competitive struggle for resources that threatens their very existence, consideration of more complex ways of reaching out to potential partners – donors, other nonprofits, government agencies, and for-profit firms – may be essential for survival. Examples of such complex alternatives are more sophisticated fund-raising (including the "development" approach), entrepreneurial ventures, investments that generate "passive" revenue, and such arrangements with other organizations as contracting and mergers. In the modern era, nonprofit organizations are well advised to reach out to consumers through

social media and other online technologies, insofar as so many potential clients and donors are attuned to Internet communication. The marketplace imposes a discipline on inefficient organizations that often results in their demise. The organizations that are most likely to survive are those that are open to daring strategies, that take advantage of their strengths and opportunities, and that increase their power relative to other entities in their task environment.

# Alternative Recruitment Strategies

Charlene M. L. Roach
Department of Political Science, Faculty of Social Sciences, The University of the West Indies, St. Augustine Campus, St. Augustine, Trinidad and Tobago

## Synonyms

Alternative employment; Alternative methods of recruitment; Alternative work arrangement; Contract employment

## Brief Definition of Alternative Recruitment Strategies

Alternative recruitment strategies are short-term measures used to attract potential persons to fill vacant positions in an organization to meet the staffing and maintenance needs of organizations without the long-term responsibility that the recruitment function requires. These include overtime, temporary employment, and contracting (outsourcing).

## Introduction

This chapter assesses alternative recruitment strategies. It begins with an overview of how recruitment strategies evolved in human resource management (HRM). It highlights the critical role of recruitment as it pertains to its staffing and maintenance activities in public organizations. It also illustrates the complexity of this function as it relates to costs, time, and labor intensiveness. There are paradoxes that need to be addressed, and this also has an impact on this function. Recruitment strategies vary depending on organizations' plans, resources, and choices. Regardless of whatever methods are used, this is a critical function as it attracts potential persons to organizations; attempts to make that mutual

appeal to them in an effort to select the most suited and successful candidates who hopefully will fit the organizational cultures; be equipped for their jobs; and will effectively perform them to accomplish the organizational goals and objectives.

Thus, the first part of the chapter provides a good background and transition into the next section which is an analysis of alternative recruitment strategies as they are used in contemporary organizations. The alternatives discussed are overtime, temporary employment, and contracting (outsourcing). This second section also discusses how these strategies have deviated from traditional ones.

Finally, the chapter ends with a critical reflection of some of the major future implications that need to be considered for the adoption of these alternative strategies in contemporary public organizations. Problems and paradoxes have developed that need to be reconciled. Other issues emerge with a clear indication of a dual system in operation where two categories of employees are recruited using traditional recruitment and alternative recruitment strategies to staff and maintain the workforce for public organizations. The literature supports the compelling advantages of alternative recruitment methods, but they come with a high cost and mixed bag of benefits and challenges. Big questions are posed. These help to frame recommendations that are proposed for future planning and consideration for Strategic HRM practices and principles.

## Evolution of Recruitment Strategies

Recruitment is a "life-blood" function in human resource management (HRM) as it focuses on the staffing and maintenance functions. Staffing is demonstrated when it provides the system with prospective candidates who possess the knowledge, skills, abilities, and aptitudes (KSAAs) for the respective jobs that become vacant or are created and require persons to fill them. In essence, it sustains the system with its valuable human resources. Maintenance is achieved when these candidates are actually hired in a timely manner and placed in the positions that match their KSAAs and their organizations' needs for these types and numbers of employees. By so doing, public bureaucracies are able to achieve their end outcomes such as productivity, efficiency, competitive service, longevity, loyalty, motivated employees, and other strategic objectives.

Although recruitment is a critical function in HRM, it is also a time consuming, costly, and labor intensive one. Time is taken for organizations to create realistic job previews; devise different methods of recruitment (internal and external); apply them to the process; interact with potential candidates while introducing them to the recruiting organizations. Additionally, organizations utilize their resources with setting up recruitment requirements such as detailed job descriptions and job specifications that highlight and differentiate essentials of each job from desirables. Organizations also need to ensure that all requirements are adhered to during the process from start to finish-thereby, enhancing reliability, validity, sensitivity, and feasibility. Human resource (HR) administrators also need to have an intimate knowledge of their organizational policies and regulations that are relevant to recruitment and comply with them and other standard operating procedures (Ivancevich 2013). Efforts are also marshaled in presenting an attractive public image of these organizations to their potential recruits.

Environmental factors may also impact the recruitment function which during the process can create time lags. Governments' policies and laws change from time to time. There may be restrictions imposed, as well as labor union agreements or negotiations. Some laws in the past made it mandatory to assess the composition of the labor force in an attempt to mitigate against discriminatory practices in employment. Yet, other factors may influence the pool of candidates recruited like sector differences, location of the agencies/organizations, and market forces. For the latter, if there is a surplus of labor, modest recruitment efforts may yield tons of applicants. On the other hand, when organizations may have reached near to their full capacity within their establishments, skilled and continued recruitment may be required

in order to attract the relevant candidates who are most suited for the positions and would be the right fits/matches for the organizations and the jobs. All of these reasons noted above and more make the recruitment function time consuming, costly, and labor intensive.

In the same vein, there are many paradoxes with recruitment in Public HRM. It is supposed to place "the right persons in the right jobs at the right time." This is not always the case. Many scholars critique this activity as some of those hired in public organizations may be "square pegs in the round holes." Similarly, other challenges such as delays due to public bureaucracies' red tape, fragmentation within these agencies, budgetary constraints, and other limitations prevent the recruitment of "the best and brightest candidates" in a timely manner. Merit lists may be created and there may be a time lag before the short-listed candidates are interviewed and another lag before they are finally selected for the positions, to the extent that many potentially capable and talented candidates lose interest or take up other positions in other sectors or other organizations where recruitment occurs faster and is more effectively executed. There are other forces that constrain this function such as politics, the economy, government and union restrictions, labor market conditions, and other internal influences that may obstruct the process to flow as HRM theory informs. Yet, recruitment is portrayed as a bedrock function in HRM. It is supposed to sustain organizations with the life blood of a cadre of human resources, with relevant KSAAs and good "persons-jobs-organizational" fits.

Traditionally, organizations adopted diverse methods to carry out this strategic function with intentions to hire employees who will be retained for permanent positions within their establishments. These methods have expanded today in contemporary organizations to include internal and external methods such as job postings, internships, referrals, internal moonlighting, e-recruiting, media advertisements, social media networking sites, employment agencies, executive search firms (for executive and higher level positions), college recruiting, vacation internships, and special events recruiting (Ivancevich 2013).

## Analysis of Alternative Recruitment Strategies: Contemporary Practices and Diversions

Alternative recruitment strategies are also being impacted by contemporary demands in the environment. These include increasing budgetary allocations for additional employees, cost containment, and other financial constraints. As a result, organizations are using these alternative methods to recruitment in strategic ways to circumvent these challenges. As noted earlier in the introduction, recruitment is a costly, labor intensive, and time consuming HR activity. Traditional recruitment absorbed the sunk costs associated with hiring and retaining these prospective employees as part of the permanent workforce within organizations.

Therefore, more and more organizations have applied alternative recruitment strategies when their HR plans may signal that additional or auxiliary human resources are needed. Hence, alternative approaches are used in order to alleviate the sunk costs associated with permanent hiring for the agency. The rationale behind these approaches was initially to give organizations temporary "relief" from incurring exorbitant costs, other budgetary commitments, and circumventing the red tape and time lags that can occur when the recruitment activity is activated to attract the prospective employees to organizations (Roach and Davis-Cooper 2012).

In the short to medium terms, alternative recruitment strategies offered multiple benefits to public organizations. Organizations received the human resources that were lacking. Time lags in between the search for prospective candidates and their actual hiring during the recruitment process were reduced. The uncertainty that is captured during recruitment of attracting and selecting "square pegs in round holes" was controlled since those recruited were there on more temporary assignments/periods. They also helped to circumvent a lot of the red tape that traditional recruitment practices.

In the long term, organizations projected and anticipated great savings from not having to pay those recruited pensions and other benefits that

permanent employees would have to be paid. Overall these alternative strategies were supposed to enhance timeliness within this HR activity which is critical to ensuring the ongoing staffing and maintenance of the HRM system. This alternative approach also minimized the strain and other challenges organizations experience when vacancies exist but due to cost, time, and other factors they are not always able to apply recruitment strategies, to replace employees in vacant positions and potentially vacant ones with potential recruits within a short space of time entailed (Roach and Davis-Cooper 2012).

These alternative methods or strategies include: over time, temporary employees, and outsourcing (or contract employment). As noted above, HRM systems in the planning function may signal the need from time to time of recruiting additional or auxiliary employees. Overtime, as an alternative strategy, facilitates this quick relief measure by allowing employees within the organizations to provide the services and KSAAs needed for jobs that exist or may be newly created. Benefits are symbiotic to organizations and employees. Organizations benefit as vacancies or labor shortages are plugged, work resumes uninterrupted, and strategic priorities are maintained. Employees also enjoy additional income, expand their skill-sets and job enrichment opportunities. On the other hand, excessive use of overtime may put a drain on organizational and human resources. In the long term, if HR planning is not effectively coordinated organizations may pay more especially if overtime becomes a recurring expenditure. Employees who work overtime on a long-term basis may suffer from work stress, burn out, and fatigue, which ultimately could impair their health and well-being and overall capacity to contribute to the achievement of organizational goals and objectives.

Similarly, temporary employment and outsourcing (or contract employment) are alternative strategies that have compelling advantages for organizations and employees. These latter methods have also become a feature of global public management cost containment initiatives. For instance, New Public Management (NPM) reform initiatives have adopted business practices to public administration and management (Hernes 2005; Hood 1991, 1998). Hence, contracting, privatization, and other efficiency measures are projected as popular approaches for public management (Ban 1999; Leland and Smirnova 2009; Lynn 1999). In keeping with these practices there is a need to cut back costs; manage human resources to the extent that more can be achieved using less; and produce greater productivity and higher performance for public organizations (Osborne and Gaebler 1992; Vigoda and Meiri 2008; Weikart 2001).

Temporary employment was typically used for lower skilled employees in administrative and clerical functions. Such employment facilitates the recruitment of these types of workers on short-term employment arrangements that require little or no formal training. There is also no obligation by employers to provide long-term compensation as those employed within the permanent establishment. Hence, under this arrangement, public organizations are not expected to incur long-term expenses such as payments of fringe benefits and other responsibilities such as pensions.

Similar to overtime, this alternative recruitment strategy offers benefits to employees such as flexibility in their work schedules, fewer risks, and, as a result, these employees may be more motivated to adapt to change demands in their work environment. For instance, temporary employees may be regarded as "on call" or "providing temporary help" as organizational needs dictate such as performing meaningful tasks in jobs that are vacant. On the other hand, organizations gain by having a continuous supply of labor with low obligations to pay them any pensions. A corollary to overtime is that excessive use of this strategy may negatively impact workers who may not develop long-term organizational ties, loyalty, or become familiar with their organizational cultures. All of these help to foster deeper bonds with employees and their organizations such as development of psychological contracts that permanent employees would have developed. By so doing, public values such as loyalty, commitment, and public service motivation and accountability to their goals could be challenged (Chen and Brudney 2009).

Outsourcing (hereafter called contract employment or contracting) is an alternative recruitment strategy which falls under NPM approaches as previously discussed (Matusik and Hill 1998). Among the hallmarks of NPM principles are efforts to streamline and increase public organizations' efficiencies, operations, processes, structures, and service delivery as they impact their responsiveness and overall productivity. These principles are becoming quite popular in light of global economic recessions, financial constraints, and reducing budgetary allocations for public organizations and other challenges. NPM philosophy reinforces principles of cut back management, decentralization, privatization, reengineering, contracting, and other reforms that reflect private sector practices. In essence, NPM uses a business model of evaluating organizations based on their returns on investments (Hood 1991, 1998; Osborne and Gaebler 1992). However, public organizations operate within a sector that is fundamentally different from the private sector. Public organizations are oriented towards serving the public and their interests whereas the private is oriented towards profitability. Sector differences exist as well in their structures and incentives. Thus, contracting as an alternative strategy to recruitment has become a contemporary NPM technique to help staff and maintain some of the human resources of public organizations.

There are many benefits for public organizations in using contract employment as an alternative recruitment strategy. However, for best practices in HRM, contracting, like temporary employment, is not intended to be a permanent method. Its contemporary usage signals diversions from traditional recruitment strategies. As with temporary employees, contract employment facilitates a peripheral human resource pool by which public organizations may attract, recruit, and select prospective individuals for jobs that require their KSAAs. They are also used during peak periods, special assignments, unique projects and other special organizational needs, and during unplanned increases in labor demands (Chen and Brudney 2009). This alternative method provides public organizations with highly skilled workers who may perform specialist roles such as for information technology (IT) expertise to staff and maintain initiatives such as e-government projects, Human Resource Information Systems, and other IT programs. Further, they contribute in circumventing limits on current employment levels (Ban 1999).

Within contemporary HRM practices, contracting is a strategic approach used to enhance knowledge management. When contract employees are recruited with their KSAAs especially those that possess idiosyncratic skills sets and very developed competencies they can be used to enhance organizations' training and development of existing employees. Strategically, they can be used to develop organizations' human resources talent management and knowledge management (Matusik and Hill 1998). Organizations by their recruitment can have time to transfer their KSAAs to existing staff, bridge skills and competencies gaps, and develop employees for success planning and other career pathing in their work streams. Using this contingent supply of human resources also provides time for organizations to develop these KSAAs and competencies to their current workforce. This approach allows cost savings from sunk costs associated with recruitment of employees who are already developed and may require more competitive compensation and benefits in the long term if they were hired as permanent human resources within the establishment.

Contract or contingent employees are not part of the permanent establishments' budgetary allocations regarding their long-term commitments for payments of benefits and other compensations. As mentioned in an earlier section, contract employees may not get time to foster a deep psychological contract with their public employers due to their temporary status (Pearce 1993). Whereas, permanent employees may expect certain protections and commitments by their employers, contract employees do not have similar or comparable expectations. They do receive benefits but to a limit. They can also feel a bit like outsiders to the permanent employees; marginalized, less committed to the public service's call to serve in the public's interest and

intrinsically not as motivated to achieve agencies' organizational goals and strategic priorities.

Hence, what has developed in its contemporary practice is a parallel system of permanent employees alongside contract workers (Marshack 2011). There are implications for this shift. In a sense, they may be perceived as not "full-fledged" employees with all the rights and privileges accorded to permanent ones. This can create awkward tensions between existing employees and contractual workers in the long term and add challenges to employment relations and other conditions of employment (Chen and Brudney 2009).

Additionally, other challenges may develop for public organizations that use this as an alternative recruitment strategy. From an HRM perspective, issues can arise such as lack of commitment due to the absence of job security, low morale, lack of motivation, job satisfaction, and low quality of work life experiences (Pearce 1993). Similarly, the persistent use of this as an alternative method may create for permanent employees inherent fears, anxieties, and stressors.

Therefore, contract employment, as one among three of the alternative recruitment strategies, is being used more as a popular contemporary NPM technique to staff and maintain the workforce of public organizations. Traditionally, this was not the rationale behind alternative recruitment strategies. While there are strategic benefits, there are also some limitations in using this as a long-term strategy of alternative recruitment. The literature demonstrates that there may be compelling advantages such as cost savings due to their temporary contracts and nontenured status within agencies' permanent establishments. Yet, on the other hand, the practice and use of contract employment as an alternative recruitment strategy in contemporary organizations demonstrate shifts from strategic HRM practices.

## Future Implications and Recommendations

From the forgoing discussion, strategic HRM views employees as their organizations' most valuable resources. It also promotes "people's first practices. This means that organizational policies, HR functions, activities, systems, processes, and operations should be streamlined in a way to promote employee engagement philosophies while organizations' strategic goals and priorities are aligned to meet their end outcomes.

Recruitment as a "life-blood" function within a strategic HRM system should be conducted in a way to ensure that the right persons are recruited for the jobs that they will be most suited for and in a timely manner. Recruitment strategies should also be linked strategically to this people's first practice by ensuring that there are good persons-jobs-organizational fits. In essence, prospective employees should be recruited to fit in well within their organizations they are hired to work in and that they will also possess the requisite KSAAs for their jobs. Within this framework, one would expect that recruitment strategies will be focused on the selection and retention of these prospective employees into organizations.

However, from time to time organizations may seek to use alternative recruitment strategies for various reasons as discussed throughout the chapter. These alternative strategies may have been initially intended as short-term measures in order to meet the staffing and maintenance needs of organizations without the long-term responsibility that the recruitment function required. Hence, organizations would be able to hire the right numbers and types of employees to perform these jobs while decreasing costs incurred through the recruitment of permanent employees.

In contemporary organizations, alternative strategies such as temporary and contract employment have been used more as popular approaches to recruitment. Clearly, this demonstrates a deviation from traditional recruitment strategies and strategic HRM principles. Such shifts to using temporary and contract employment as alternative strategies to sustain the staffing needs of public organizations may have serious implications for the future and for best practices as they relate to strategic HRM. Some of these implications include but are not limited to knowledge management systems, talent management, employee

engagement, and transfer of KSAAs from contracted persons to permanent employees.

The use of alternative strategies alongside conventional methods of recruitment produces paradoxes within an HRM system. In many public organizations today there exist parallel systems of contract and permanent employees. This may produce some awkward tensions between tenured and nontenured staff. It may also impact negatively on contract employees' abilities to commit to their organizations' long-term goals wholeheartedly under agreements that are not permanent. While temporary and contract employment as alternative strategies are becoming the hallmark of NPM principles and practices, there may be positive and negative impacts to both employees and their organizations.

A corollary to this twofold system of recruitment and alternative recruitment strategies are awkward tensions between permanent and contingent employees. This unresolved issue can also lead to low morale, poor quality of work life experiences, and internal conflicts between two categories of employees. Some who are contracted may even perceive that there may be little qualitative differences between their jobs and what contracted persons perform. This is a matter for HR professionals and public administrators to reconcile in the near future if this dual system persists.

These dual impacts are areas for administrators to consider as they streamline HR policies, strategic HRM approaches and recruitment strategies. Questions arise over how the recruitment function using a strategic HRM approach that focuses on people's first practices, selecting employees who would fit, produce and be retained; yet, at the same time, adopting alternative recruitment strategies in a sustained manner that do not retain employees permanently expect them to produce organizational end outcomes and provide no commitment to them regarding their permanent well-being such as tenure, benefits, compensation, and other perks. It seems to suggest that within the same organization there is a different psychological contract that exists between their employers and these two categories of employees. The question remains, is this popular trend the way to go as a contemporary recruitment approach and philosophy in HRM? How should public administrators define temporary and contract employees within public organizations? Are we being fair to them and are these practices consistent with strategic HRM principles, i.e., a people's first practice? How can these employees be engaged in temporary and contracted positions while working alongside permanent ones within their establishments? How are permanent employees being affected by those contracted by the same organization to work alongside them and at times to work with them? These are "big questions" for public HRM to address and for administrators to reflect on as they observe the dual system and its mixed impacts on all stakeholders.

Clearly, the literature demonstrates that there are compelling benefits to alternative recruitment strategies. Organizations and employees both share some degree of gains and losses. Thus, another implication to address in the future is to consider from a cost benefit analysis whether gains outweigh the costs or costs exceed these benefits.

Reflectively, some recommendations to consider for the near future as strategic HRM practices are implemented in public organizations is to determine how alternative recruitment strategies will be used within public organizations strategically and be linked to organizational strategic plans, HRM policies, and HR functions to ensure that end outcomes will be achieved. Mechanisms need to be put in place for monitoring, tracking, evaluating, and implementing policies as they relate to alternative recruitment strategies. The next recommendation is to continually assess the long-term impacts of cost containment initiatives as they relate to recruitment and other HR functions such as planning which should be linked carefully within an HRM system.

## Conclusion

Alternative recruitment strategies do present a mixed bag of negative and positive impacts. Careful HR planning will need to be exercised in reflecting on past implications and future plans. Recommendations may also play a critical role in evaluating how these strategies are being

implemented and their effects on public service values, public HRM practices, employees, and their work places.

# Amortization and Depreciation

Marco Maffei
University of Naples "Federico II", Naples, Italy

## Synonyms

*Amortization* and *depreciation* have the same meaning. In some countries, the term provision is used in the context of items such as depreciation and impairment of assets; these kinds of provision are to be intended as adjustments to the carrying amounts of assets.

## Definition

Proper definitions are provided in the International Accounting Sector Accounting Standards. In this document the references are to IPSAS 17, Property, Plant, and Equipment, and IPSAS 31, Intangible Assets.

Amortization: Amortization is the systematic allocation of the depreciable amount of an asset over its useful life. In the case of an intangible asset, the term amortization is generally used instead of depreciation. Both terms have the same meaning.

Depreciation: Depreciation is the systematic allocation of the depreciable amount of an asset over its useful life. In the case of a tangible asset, the term depreciation is generally used instead of amortization. Both terms have the same meaning.

Depreciable amount: Depreciable amount is the cost of an asset, or other amount substituted for cost, less its residual value.

Impairment: Impairment is a loss in the future economic benefits or service potential of an asset, over and above the systematic recognition of the loss of the asset's future economic benefits or service potential through depreciation (amortization).

## Introduction

Amortization and depreciation are expenses, which arise from the consumption of assets

through depreciation and erosion of service potential and ability to generate economic benefits through impairments.

Under the historical cost model, assets are initially reported at the cost incurred on their acquisition. Subsequent to initial recognition, this cost may be allocated as an expense to reporting periods in the form of depreciation or amortization for certain assets, as the service potential or ability to generate economic benefits provided by such assets is consumed over their useful lives.

If an asset has been acquired in an exchange transaction, historical cost provides information on the resources available to provide services in future periods, based on their acquisition cost. To reflect the operational capacity of the asset, when depreciation or amortization is recognized, it reflects the extent to which the service potential of an asset has been consumed. Historical cost information shows that the resources available for future services are at least as great as the amount at which they are stated.

Estimates of depreciation and impairment used in the historical cost model, particularly for noncash-generating assets, can affect representational faithfulness. Because application of historical cost generally reflects resources consumed by reference to actual transactions, historical cost measures are verifiable and understandable and can be prepared on a timely basis.

## Depreciation of Property, Plant, and Equipment

One of the main issues is the depreciation charges and impairment losses to be recognized in relation to property, plant, and equipment. After recognition as an asset, an item of property, plant, and equipment shall be carried at its cost, less any accumulated depreciation and any accumulated impairment losses.

### Component Approach

Each part of an item of property, plant, and equipment with a cost that is significant in relation to the total cost of the item shall be depreciated separately. An entity allocates the amount initially recognized in respect of an item of property, plant, and equipment to its significant parts and depreciates separately each such part. A significant part of an item of property, plant, and equipment may have a useful life and a depreciation method that are the same as the useful life and the depreciation method of another significant part of that same item. Such parts may be grouped in determining the depreciation charge.

To the extent that an entity depreciates separately some parts of an item of property, plant, and equipment, it also depreciates separately the remainder of the item. The remainder consists of the parts of the item that are individually not significant. If an entity has varying expectations for these parts, approximation techniques may be necessary to depreciate the remainder in a manner that faithfully represents the consumption pattern and/or useful life of its parts.

An entity may choose to depreciate separately the parts of an item that do not have a cost that is significant in relation to the total cost of the item. The depreciation charge for each period shall be recognized in surplus or deficit, unless it is included in the carrying amount of another asset.

### The Depreciation Charge

The depreciation charge for a period is usually recognized in surplus or deficit. However, sometimes, the future economic benefits or service potential embodied in an asset is absorbed in producing other assets. In this case, the depreciation charge constitutes part of the cost of the other asset and is included in its carrying amount. For example, the depreciation of manufacturing plant and equipment is included in the costs of conversion of inventories. Similarly, depreciation of property, plant, and equipment used for development activities may be included in the cost of an intangible asset.

### Useful Life and Residual Value

The depreciable amount of an asset shall be allocated on a systematic basis over its useful life.

The residual value and the useful life of an asset shall be reviewed at least at each annual reporting date and, if expectations differ from previous estimates, the change(s) shall be

accounted for as a change in an accounting estimate.

Depreciation is recognized even if the fair value of the asset exceeds its carrying amount, as long as the asset's residual value does not exceed its carrying amount. Repair and maintenance of an asset does not negate the need to depreciate it. Conversely, some assets may be poorly maintained or maintenance may be deferred indefinitely because of budgetary constraints. Where asset management policies exacerbate the wear and tear of an asset, its useful life should be reassessed and adjusted accordingly.

The depreciable amount of an asset is determined after deducting its residual value. In practice, the residual value of an asset is often insignificant and therefore immaterial in the calculation of the depreciable amount.

The residual value of an asset may increase to an amount equal to or greater than the asset's carrying amount. If it does, the asset's depreciation charge is zero unless and until its residual value subsequently decreases to an amount below the asset's carrying amount.

Depreciation of an asset begins when it is available for use, i.e., when it is in the location and condition necessary for it to be capable of operating in the manner intended by management. Depreciation of an asset ceases when the asset is derecognized. Therefore, depreciation does not cease when the asset becomes idle or is retired from active use and held for disposal unless the asset is fully depreciated. However, under usage methods of depreciation, the depreciation charge can be zero while there is no production.

### Future Economic Benefits of Property, Plant, and Equipment and Their Consume

The future economic benefits or service potential embodied in an item of property, plant, and equipment is consumed by the entity principally through the use of the asset. However, other factors such as technical or commercial obsolescence and wear and tear while an asset remains idle often result in the diminution of the economic benefits or service potential that might have been obtained from the asset. Consequently, all the following factors are considered in determining the useful life of an asset: (i) expected usage of the asset, which is assessed by reference to the asset's expected capacity or physical output; (ii) expected physical wear and tear, which depends on operational factors such as the number of shifts for which the asset is to be used and the repair and maintenance program, and the care and maintenance of the asset while idle; (iii) technical or commercial obsolescence arising from changes or improvements in production or from a change in the market demand for the product or service output of the asset; and (iv) legal or similar limits on the use of the asset, such as the expiry dates of related leases.

The useful life of an asset is defined in terms of the asset's expected utility to the entity. The asset management policy of an entity may involve the disposal of assets after a specified time or after consumption of a specified proportion of the future economic benefits or service potential embodied in the asset. Therefore, the useful life of an asset may be shorter than its economic life. The estimation of the useful life of the asset is a matter of judgment based on the experience of the entity with similar assets.

Land and buildings are separable assets and are accounted for separately, even when they are acquired together. With some exceptions, such as quarries and sites used for landfill, land has an unlimited useful life and therefore is not depreciated. Buildings have a limited useful life and therefore are depreciable assets. An increase in the value of the land on which a building stands does not affect the determination of the depreciable amount of the building.

If the cost of land includes the cost of site dismantlement, removal, and restoration, that portion of the land asset is depreciated over the period of benefits or service potential obtained by incurring those costs. In some cases, the land itself may have a limited useful life, in which case it is depreciated in a manner that reflects the benefits or service potential to be derived from it.

### The Depreciation Method

The depreciation method shall reflect the pattern in which the asset's future economic benefits or service potential is expected to be consumed by the entity.

The depreciation method applied to an asset shall be reviewed at least at each annual reporting date, and, if there has been a significant change in the expected pattern of the consumption of the future economic benefits or service potential embodied in the asset, the method shall be changed to reflect the changed pattern. Such a change shall be accounted for as a change in an accounting estimate.

A variety of depreciation methods can be used to allocate the depreciable amount of an asset on a systematic basis over its useful life. These methods include the straight-line method, the diminishing balance method, and the units of production method. Straight-line depreciation results in a constant charge over the useful life if the asset's residual value does not change. The diminishing balance method results in a decreasing charge over the useful life. The units of production method result in a charge based on the expected use or output. The entity selects the method that most closely reflects the expected pattern of consumption of the future economic benefits or service potential embodied in the asset. That method is applied consistently from period to period unless there is a change in the expected pattern of consumption of those future economic benefits or service potential.

### Impairment

To determine whether an item of property, plant, and equipment is impaired, an entity applies IPSAS 21 or IPSAS 26, Impairment of Cash-Generating Assets, as appropriate. These Standards explain how an entity reviews the carrying amount of its assets, how it determines the recoverable service amount or recoverable amount of an asset, and when it recognizes, or reverses the recognition of, an impairment loss.

### Recognition and Measurement Issues in Case of Application of the Revaluation Model

After recognition as an asset, an item of property, plant, and equipment whose fair value can be measured reliably shall be carried at a revalued amount, being its fair value at the date of the revaluation, less any subsequent accumulated depreciation, and subsequent accumulated impairment losses. When an item of property, plant, and equipment is revalued, any accumulated depreciation at the date of the revaluation is treated in one of the following ways: (i) restated proportionately with the change in the gross carrying amount of the asset, so that the carrying amount of the asset after revaluation equals its revalued amount. This method is often used when an asset is revalued by means of applying an index to its depreciated replacement cost, eliminated against the gross carrying amount of the asset and the net amount restated to the revalued amount of the asset. This method is often used for buildings.

The amount of the adjustment arising on the restatement or elimination of accumulated depreciation forms part of the increase or decrease in carrying amount that is accounted for.

Some or all of the revaluation surplus included in net assets/equity in respect of property, plant, and equipment may be transferred directly to accumulated surpluses or deficits when the assets are derecognized. This may involve transferring some or the whole of the surplus when the assets within the class of property, plant, and equipment to which the surplus relates are retired or disposed of. However, some of the surplus may be transferred as the assets are used by the entity. In such a case, the amount of the surplus transferred would be the difference between depreciation based on the revalued carrying amount of the assets and depreciation, based on the assets' original cost. Transfers from revaluation surplus to accumulated surpluses or deficits are not made through surplus or deficit.

## Amortization of Intangible Asset

One of the main issues is the amortization charges and impairment losses to be recognized in relation to intangible assets. After recognition as an asset, an item of intangible assets shall be carried at its cost, less any accumulated depreciation and any accumulated impairment losses.

### Amortization Period and Amortization Method

The depreciable amount of an intangible asset with a finite useful life shall be allocated on a systematic basis over its useful life. Amortization shall begin when the asset is available for use, i.e., when it is in the location and condition necessary for it to be capable of operating in the manner intended by management. Amortization shall cease earlier of the date that the asset is classified as held for sale (or included in a disposal group that is classified as held for sale) in accordance with the relevant international or national accounting standard dealing with noncurrent assets held for sale and discontinued operations and the date that the asset is derecognized. The amortization method used shall reflect the pattern in which the asset's future economic benefits or service potential are expected to be consumed by the entity. If that pattern cannot be determined reliably, the straight-line method shall be used. The amortization charge for each period shall be recognized in surplus or deficit unless this or another Standard permits or requires it to be included in the carrying amount of another asset.

A variety of amortization methods can be used to allocate the depreciable amount of an asset on a systematic basis over its useful life. These methods include the straight-line method, the diminishing balance method, and the unit of production method. The method used is selected on the basis of the expected pattern of consumption of the expected future economic benefits or service potential embodied in the asset and is applied consistently from period to period, unless there is a change in the expected pattern of consumption of those future economic benefits or service potential.

Amortization is usually recognized in surplus or deficit. However, sometimes the future economic benefits or service potential embodied in an asset are absorbed in producing other assets. In this case, the amortization charge constitutes part of the cost of the other asset and is included in its carrying amount. For example, the amortization of intangible assets used in a production process is included in the carrying amount of inventories.

### Review of Amortization Period and Amortization Method

The amortization period and the amortization method for an intangible asset with a finite useful life shall be reviewed at least at each reporting date. If the expected useful life of the asset is different from previous estimates, the amortization period shall be changed accordingly. If there has been a change in the expected pattern of consumption of the future economic benefits or service potential embodied in the asset, the amortization method shall be changed to reflect the changed pattern. Such changes shall be accounted for as changes in accounting estimates.

During the life of an intangible asset, it may become apparent that the estimate of its useful life is inappropriate. For example, the recognition of an impairment loss may indicate that the amortization period needs to be changed.

Over time, the pattern of future economic benefits or service potential expected to flow to an entity from an intangible asset may change. For example, it may become apparent that a diminishing balance method of amortization is appropriate rather than a straight-line method. Another example is if the use of the rights represented by a license is deferred, pending action on other components of the entity's strategic plan. In this case, economic benefits or service potential that flows from the asset may not be received until later periods.

Amortization of an intangible asset with a finite useful life does not cease when the intangible asset is no longer used, unless the asset has been fully depreciated or is classified as held for sale (or included in a disposal group that is classified as held for sale) in accordance with the relevant international or national accounting standard dealing with noncurrent assets held for sale and discontinued operations.

## Further Accounting Issues of Amortization and Depreciation

### Changes in Accounting Estimates

A change in the estimated useful life of, or the expected pattern of consumption of economic

benefits or service potential embodied in, a depreciable asset affects the depreciation expense for the current period and for each future period during the asset's remaining useful life. The effect of the change relating to the current period is recognized as revenue or expense in the current period. The effect, if any, on future periods is recognized in future periods.

### Finance Leases

Finance lease gives rise to a depreciation expense for depreciable assets. The depreciation policy for depreciable leased assets shall be consistent with that for depreciable assets that are owned. If there is no reasonable certainty that the lessee will obtain ownership by the end of the lease term, the asset shall be fully depreciated over the shorter of the lease term or its useful life. The depreciable amount of a leased asset is allocated to each accounting period during the period of expected use on a systematic basis consistent with the depreciation policy the lessee adopts for depreciable assets that are owned. If there is reasonable certainty that the lessee will obtain ownership by the end of the lease term, the period of expected use is the useful life of the asset; otherwise the asset is depreciated over the shorter of the lease term or its useful life. The sum of the depreciation expense for the asset and the finance expense for the period is rarely the same as the lease payments payable for the period, and it is therefore inappropriate simply to recognize the lease payments payable as an expense. Accordingly, the asset and the related liability are unlikely to be equal in amount after the commencement of the lease term.

### Service Concession Arrangements

Depreciation or amortization is based on that deemed cost and starts from the date for which the entity established the deemed cost.

## Disclosure Issues

The financial statements shall disclose, for each class of property, plant, and equipment recognized in the financial statements: (i) the depreciation methods used, (ii) the useful lives or the depreciation rates used, (iii) the gross carrying amount and the accumulated depreciation (aggregated with accumulated impairment losses) at the beginning and end of the period, and (iv) selection of the depreciation method and the estimation of the useful life of the assets are matters of judgment. Therefore, disclosure of the methods adopted and the estimated useful lives or depreciation rates provide users financial statements with information that allows them to review the policies selected by management and enables comparisons to be made with other entities. For similar reasons, it is necessary to disclose depreciation, whether recognized in surplus or deficit or as a part of the cost of other assets, during a period, and accumulated depreciation at the end of the period.

The financial statements shall disclose, for each class of intangible assets, distinguishing between internally generated intangible assets and other intangible assets: (i) whether the useful lives are indefinite or finite and, if finite, the useful lives or the amortization rates used, (ii) the amortization methods used for intangible assets with finite useful lives, (iii) the gross carrying amount and any accumulated amortization (aggregated with accumulated impairment losses) at the beginning and end of the period, (iv) the line item(s) of the statement of financial performance in which any amortization of intangible assets is included, and (v) a description, the carrying amount, and remaining amortization period of any individual intangible asset that is material to the entity's financial statements.

### Information to be Presented on the Face of the Statement of Financial Performance

Amortization and depreciation are presented on the face of the statement of financial performance. However, the thoroughness of the information concerning these items depends on the classification employed based on either the nature of expenses or their function within the entity, whichever provides information that is reliable and more relevant. The first form of analysis is the nature of expense method: amortization and depreciation are aggregated according to the nature and are not reallocated among various

functions within the entity. The second form of analysis is the function of expense method, which classifies expenses according to the program or purpose for which they were made. This method can provide more relevant *information* to users than the classification of expenses by nature, but allocating amortization and depreciation to functions. This allocation could suffer arbitrary allocations and could involve considerable judgment.

### Reporting Cash Flows from Operating Activities

Under the indirect method, the net cash flow from operating activities is determined by adjusting surplus or deficit from ordinary activities for the effects of noncash items such as depreciation and amortization.

### Segment Assets and Expense

Segment assets include current assets that are used in the operating activities of the segment: property, plant, and equipment, assets that are the subject of finance leases, and intangible assets. If a particular item of depreciation or amortization is included in segment expense, the related asset is also included in segment assets. Jointly used assets are allocated to segments if, and only if, their related revenues and expenses are also allocated to those segments. For example, an asset is included in segment assets if, and only if, the related depreciation or amortization is included in measuring segment expense.

## Synonyms

Contracting out; Public buying; Public contract

## Definition

Public procurement refers to the process by which public authorities, such as government departments or local authorities, purchase work, goods, or services from suppliers.

## Introduction

Public authorities have a statutory obligation to provide certain types of public goods and public services. These can be provided in-house or by outsourcing. The outsourcing of public goods and services can be realized in the form of a public contract or PPP project. In the case of a public contract, the contracting authority is the key actor. In short, the contracting authority is one of the public authorities. It uses the public contract as an effective allocation of resources, by which the contracting authority usually pursues economic and social objectives. The role of the contracting

authority may be played by the state (for example, a particular ministry), a municipality, a government organization, and the like. A public contract can be defined as the case where a public project (for example, construction of a highway or the purchase of vehicles for police and the like) or activity (for example, guard or cleaning services in Ministry buildings) or a public service (for example, ensuring transport services to an area) is not carried out by the public actor, but by a nonpublic entity (also referred to as a contractor). Public contracts can be divided into construction public contracts (such as motorways, municipalities building kindergartens, etc.), supplies (such as hospital equipment, fire brigade vehicles, etc.), and services (such as public transport, waste collection in the municipality, etc.).

In economic terms, public procurement is understood as a way of allocating resources in the public sector as part of the economic system. The reasons for the existence of public contracts are related to the fulfillment of the role of the state. Economically developed countries are so-called mixed economies, where there are concurrently private and public sector entities. In doing so, the public sector has a significant impact on all economic processes.

Current mainstream economics thus admits the necessity of state intervention in the economy and explains market failures, where markets do not allocate (Pareto) the optimal state. These "failures" include, in particular, externalities, public goods, imperfect competitive structures, and incomplete information. These microeconomic aspects relate mainly to the allocation role of the state. From a macroeconomic point of view, the function of the state is based, for example, on the existence of business cycles. In all its activities, the public sector uses a large number of goods and services which it either consumes or provides to others.

Erridge and McIlroy (2002) in the context of public procurement policy being outside economic objectives (e.g., to minimize costs, efficiency) emphasize the objectives of regulatory (e.g., the development of a single EU market) and social (e.g., the promotion of employment, favor certain social groups or environmental aspects). In general, various noneconomic objectives may conflict with economic objectives, for example, favoring contractors employing people with disabilities may result in increased costs for the desired good and create less efficient public procurement. Another problem is a possible conflict with the principles of national and supranational legislation, in particular the principle of nondiscrimination, which could be violated in favor of a certain group of suppliers. Another possible risk may be the related reduction in the transparency of public finances as well as an increase in the cost of acquiring the good.

Unlike with purchasing by ordinary consumers, in public procurement, it is true that the purchasing entity is not the final consumer and the characteristics of the purchased goods thus do not directly affect the level of utility of the contracting authority (or persons who decide on the purchase). Purchasing in public procurement is also decided by a larger number of people, which can result in inflexible and slow decision-making. As far as the volume of trades carried out through public procurement is concerned, it is also incomparably larger than in standard consumer purchases. Last but not least, the fundamental difference is the formalized procurement process aimed at imitating the market mechanism, where the only bidder is the contracting authority.

Why public procurement is important:

- Every year, public authorities important of GDP on the purchase of services, works and supplies.
- In many sectors such as energy, transport, waste management, social protection and the provision of health or education services, public authorities are the principal buyers.
- The public sector can use procurement to boost jobs, growth, and investment, and to create an economy that is more innovative, resource and energy efficient, and socially inclusive.
- High quality public services depend on modern, well-managed, and efficient procurement.
- Improving public procurement can yield big savings (European Commission 2017).

Modern public procurement is based on the following elements:

- Value for money: Providing the required goods, works, and services in an economic, efficient, and effective way.
- Transparency: Disclosure of information related to public procurement procedures in a comprehensible, accessible, and timely manner.
- Fairness: The public procurement process should be free from bias and ensure equal treatment of all bidders.
- Good governance: Procurement should not be seen as an administrative process; on the contrary, it is as an opportunity to deliver various societal objectives through smart spending. This may lead to improved trust in government, green measures, social measures, or innovation (European Commission 2016).

Therefore, we can also include the term responsible public procurement under the term good governance which is a process whereby organizations meet their needs for goods, service, works, and utilities in a way that achieves value for money on a whole life basis in terms of generating benefits to society and the economy, while minimizing damage to the environment (Sustainable Procurement Task Force UK 2006). Specifically, this means the following forms of public procurement (Sustainable Procurement Task Force UK 2006):

- Socially responsible public procurement I (focuses on the social aspects of responsible procurement, such as promoting the employment of people disadvantaged in the labor market, decent working conditions, etc.)
- Socially responsible public procurement II (these are procedures that take into account social criteria, so the emphasis is on social inclusion, social and labor rights, fair trade, etc.)
- Sustainable public procurement (covering both social and environmental aspects)
- Green public procurement (focusing on environmental aspects only)

## Procurement Life Cycle

According to the material of the World Bank, the process of awarding and implementing a public contract is carried out in the following steps.

The first step is to assess needs, prepare a tender, and publish it. This phase is extremely important because the quality of the tender preparation will be reflected in its results, which are the final price of the contract, the managing of the work, and deliveries within the time limit as well as the quality of supply. At this stage, the contracting authority may use consultations with potential suppliers, internal market analysis, and other tools. From the perspective of potential suppliers, as much information as possible needs to be made available such as the procurement plans, tender notices, and tender documents in order to make a decision on whether to file an objection (World Bank 2016).

The next step is the bid submission phase. In this section, the potential supplier submits a bid. It is often necessary to prove that the supplier meets all the requirements of the tender. These requirements can create unnecessary hurdles. It is therefore important to make sure that the process is streamlined and easily accessible to all bidders (e.g., the possibility to bid online or to provide access to foreign companies to the markets) (World Bank 2016).

This is followed by the bid opening, evaluation, and awarding phase. This part of the public contract is critical in terms of transparency, corruption, and integrity; it is necessary to guarantee the fairness and efficiency of the whole process. Specific steps include a transparent bidding procedure that can be online or open to the public. This is followed by the process of evaluating the bids, justifying the selection of the specific tenderer, and then informing the unsuccessful tenderers. This phase is completed by signing a contract with the successful tenderer (World Bank 2016).

A complaint filed by an unsuccessful bidder may occur during the above-mentioned bid opening, evaluation, and awarding phase, the pre-award stage. Bidders or potential bidders can notice flaws in the procurement process. They

then should be able to file a complaint and receive a decision in a timely manner. The following factors are particularly important at this stage: legal standing to file a complaint, the cost of filing a complaint, the existence of a requirement to notify the procuring entity, the existence and duration of a suspension of the procurement process, the independence and training of the reviewers of the complaint, the time to render a decision, remedies granted by the first-tier review, and publication of decisions. Depending on the settings of the public procurement regulatory system, the unsuccessful tenderer may be able to appeal to a second tier review body (World Bank 2016).

Equally important is the actual implementation and management of the procurement contract. Procurement management must be transparent and must provide sufficient assurance and protection to the winner of the contract against unilateral change of contract by the contracting authority. There may also be changes to contracts or complete cancellation of the public contract. This phase culminates in the assumption of the subject of the public contract (World Bank 2016).

One of the final stages is the collection of performance guarantee and payment to suppliers. Performance guarantee protects contracting authorities against delays in delivery of the contract. The payment process itself can be divided into several sections or the entire amount can be paid at once. The payment mechanism chosen significantly affects the cash flow of the payment recipient (World Bank 2016).

## Factors Influencing Public Procurement

The final public procurement results are the result of a combination of the contracting authority's internal decisions and external institutional factors. Internal factors include the decisions of the contracting authority that affect the public contracts. The core rules for procurement decisions are determined by the existing legislation, but the contracting authority has sufficient discretion within the existing legislation to determine all of the details, with possible impacts on processes and results, such as the results of public contracts.

The contracting authority can manipulate the anticipated value as many studies show that it is possible for the contracting authority to manipulate the expected size of the public contract so that it falls below the threshold where the public contract would have to be strictly regulated by law. This manipulation is often used to award work to a local business.

The way that the details of tender rules are defined can very well determine the potential number of bidders. As for the impact of the number of bids on the resulting price, the results of empirical studies show that the number of bids has a clear effect on the resulting contract price. Up to some point, the higher the competition is, the lower the prices are. Most empirical studies do not consider this relationship to be linear.

One frequently discussed issue is the tendering method used for the public procurement. Most authors argue that open tenders create greater competition and potentially lower prices and, of course, lower risk of corruption. Contract overpricing is often due to the selection of non-transparent and restrictive procedures.

In evaluating public contracts, the contracting authority may choose between an economic advantage evaluation and an evaluation based on the lowest bidder. The choice of evaluation is linked to the uncertainty level. They insist that "points to lowest price as an adequate method when the degree of uncertainty is low, for example, because the procured products are standardized and since quality is verifiable. When there is significant cost uncertainty, it is better to use the so-called MEAT (the Most Economically Advantageous tender) method." (Lundberg and Bergman 2017).Using the lowest price criterion appears to be the most advantageous for the contracting authority in terms of transaction costs and possible administrative risks. However, lowest-price-based contracts for services and works are very risky. Several studies question this option, as very often there are additional contract changes that increase the final price or unacceptably low quality is delivered.

If we focus on external and institutional factors, corruption must be considered. The first very important institutional factor is corruption. This

problem is often perceived as a trade-off between avoiding corruption and giving officials the flexibility to make decisions in light of their own knowledge (Rose-Ackerman 1999). Locatelli et al. (2017) state that there is a risk of corruption at all stages of the preparation of public projects and that corruption has a significant impact on the results of these projects. Carson et al. (2006) argue that it is not socially optimal to try to achieve zero corruption, as the potential benefit of achieving this state will be outweighed by the transaction costs to the public sector. In terms of analysis, corruption is very difficult to uncover. The corruption perception index (CPI) from Transparency International is the one used most frequently for this measurement. Some studies claim that the CPI is an appropriate tool for measuring corruption. Other authors criticize this approach as being excessively subjective and having problems with the validity of the sample of respondents. Based on an analysis of large administrative data on government procurement, Fazekas et al. (2016) constructed government indicators with the purpose of identifying areas more likely to uncover corruption. Doroftei (2016) notes that kickbacks and the percentage of particularistic awarded values can be used as a measure of corruption. Fervarda et al. (2017) use significant signs of public procurement to establish corruption indicators for identified corrupt practices. According to Hudon and Garzón (2016), a corrupt coalition consists of entrepreneurs, officials, and politicians who have to achieve three basic things: (1) identify suitable members of the coalition, (2) generate and distribute the benefits of corrupt behavior, and (3) evade external and internal controls. Uncertainty will therefore logically increase the transaction costs of creating such coalitions and lead to the overpricing of public contracts.

Another important and frequently mentioned factor is the quality of governance. A limited quality of governance can be a source of passive corruption because of the low quality of regulation and the negative power (influence) of the regulating institutions. Many studies describe how a regulator's decision in the public procurement market influences the behavior of the contracting authorities. This topic is especially important for low-performing countries that are still struggling with institutional quality. According to Grødeland and Aasland (2011), these countries are still fighting habits such as negative perceptions of the law and informal practices. They also underline the influence of culture, which is often defined as shared beliefs, attitudes, values, norms, and practices, and the necessity of its recognition in the academic literature as an element of potential importance, as it has not been incorporated into the design of aid programs to reform civil services.

Another important factor is the administrative organization of public procurement. In this context, there is often talk about the centralization versus decentralization of public procurement. The OECD (2007) notes the following benefits of centralizing public procurement: better products, reduced legal costs, and easier procurement procedures. Centralized procurement should be used for the purchase of standardized commodities such as common interest goods, furniture, travel and transport services, and ICT goods. The potential benefits are usually greater for smaller entities than for larger purchasing entities, and it is expected to be advantageous for countries with a higher number of smaller purchasing entities. However, it creates many risks. In addition to the problem of centralized corruption, creating barriers to the entrance of small and medium-sized suppliers, collusive cartels, the demanding implementation of a central procurement system, and the rise of costs associated with coordination, investments, and transactions in the first years of operation.

Various authors have argued that the efficiency of public procurement can be affected by the economic wealth of the country. Specific issues for less developed countries include local preferences, described using the term "home bias," which can be defined as preferring domestic suppliers to international competition. This may also be due to differences between the cost functions of domestic and foreign suppliers. Explanations may vary. For example, the difference may be due to corrupt behavior, as corruption networks can be better created in an "intimate" home environment.

Another explanation may be related to macroeconomic variables such as GDP growth, unemployment rates, and real exchange rates. With high GDP growth, the motivation for home bias is lower because there is no need for stimulus in the spirit of the Keynesian political economy. Keulemans and Van de Walle (2017) showing home favoritism may be part of the public's demands. However, their empirical analyzes also show a change in public preference towards sustainable procurement.

# Animal Care in Disaster Response

Abdul-Akeem Sadiq[1] and Rachell Laucevicius[2]
[1]School of Public Administration, University of Central Florida, Orlando, FL, USA
[2]Indiana University-Purdue University Indianapolis, Indianapolis, IN, USA

## Synonyms

Disaster response for animals; Federal pet policy; Household pets; Pet shelter; Pets and emergency support functions; Pets Evacuation and Transportation Standards (PETS) Act

## Definition

Animal care is defined as providing for the physical and emotional needs of all animals under ones' stewardship.

> "Caring for animals is a credible component of providing care to people, because the needs of animals are inevitably linked to the needs of people," – Patricia Forkan, Executive Vice President of the Humane Society of the United States (2010)

## Introduction

Animals are a large part of daily life in the United States. In this chapter, we focus on pets or companion animals. According to the Humane Society of the United States (HSUS), there are over 358 million pets in the United States (Mike 2011). A household pet is a "... domesticated animal, such as a dog, cat, bird, rabbit, rodent, or turtle that is traditionally kept in the home for pleasure rather than for commercial purposes, can travel in commercial carriers, and be housed in temporary facilities" (Federal Emergency Management Agency (FEMA 2007, p. 1)). Disasters can have significant consequences on pets as was the case in the aftermath of Hurricane Katrina. The loss of companion animals often leads to substantial stress on the owners because companion animals are sometimes viewed and treated as surrogate persons (Gunter 1999) or as family members (Triebenbacher 2000). This chapter provides critical insights into animal care before, during, and after Hurricane Katrina. In addition, it focuses on various legislations regarding animal care during disasters. Finally, this chapter concludes by offering some recommendations for improving the care of animals during disasters.

## Animal Care in Disasters Pre-Katrina

Although Hurricane Katrina brought unprecedented national attention to the plight of household pets in disasters, this was not the first disaster to highlight the suffering of animals during disasters. After Hurricane Andrew ravaged south Florida in 1992, approximately 1,000 dogs and cats were euthanized for a lack of shelter space (Irvine 2004). Responders that focused on animal rescue efforts prior to Hurricane Andrew were often stifled as animal control, rescue, and treatment were considered nonessential. At the National Animal Disaster Conference in Orlando, Florida, in March 2000, Patricia Forkan, executive vice president of the Humane Society of the United States, stated "I clearly remember our teams going into disaster areas and essentially being told that animal needs weren't even on the list of priorities, much less anywhere near the top" (Montl 2010).

The most significant response to the animal tragedy of Hurricane Andrew was the creation of Veterinary Medical Assistance Teams (VMAT) by the American Veterinary Medical Association (AVMA) and the signing of a Memorandum of Understanding (MOU) with the Department of Health and Human Services, making VMAT part of the Federal Response Plan in 1993. In 1994, the AVMA also signed a MOU with the Department of Agriculture, allowing the response of VMAT to animal health emergencies. This made members of the VMAT temporary federal employees when activated by the National Disaster Medical System, at the request of affected states (Montl 2010).

Hurricane Floyd struck North Carolina on September 16, 1999, killing 56 people and over three million domestic and farm animals (North Carolina State Animal Response Team 2013).

This disaster sparked the creation of a cooperative response plan that included state agencies, non-governmental organizations, and animal groups and led to the creation of the State Animal Response Team (SART) in North Carolina. However, even though many states created partnerships for the care of animals in emergencies after the tragedies of Hurricane Andrew and Floyd, there was nowhere near the large-scale coordination required to respond to the catastrophe of Hurricane Katrina. In almost alarming accuracy, Craig Fugate, then bureau chief for preparedness and response with the State of Florida, pointed out several of the issues that would haunt response to Katrina while at the National Animal Disaster Conference in 2000. Fugate stated one of the most important things to remember about animals and disasters is that "people will not take appropriate measures to take care of themselves if they can't take care of their pets" (Montl 2010). The purpose of evacuation, he said, is to get people out of harm's way, and if "... people are choosing to stay, we have not improved the situation," if "... people are going to choose behavior that puts them in harm's way to save and protect their animals, we're going to lose people" (Montl 2010).

## Animal Care During Katrina

In addition to the more than 1,400 lives lost, Hurricane Katrina had a devastating impact on pets and tested the human-animal bond. Of the approximately 259,400 families that owned pets in New Orleans prior to Hurricane Katrina, about 104,000 pets were abandoned in the storm according to Louisiana Society for the Prevention of Cruelty to Animals (SPCA 2016). Of this number, an estimated 88,700 pets have yet to be accounted for (Louisiana SPCA 2016). Prior to Hurricane Katrina making landfall, Louisiana SPCA evacuated 263 animals from Japonica Street shelter in Ninth Ward, Louisiana, to Houston SPCA (Louisiana SPCA 2016). Due to the destruction of the Louisiana SPCA shelter, there was a need to find a replacement. With the help from the Louisiana Department of Agriculture and Forestry, a new shelter, the Lamar Dixon Expo Center, which was an equestrian center, became the new animal shelter (Louisiana SPCA 2016). It was there that the largest animal rescue and shelter operations in US history took place; over 15,500 animals were rescued (Louisiana SPCA 2016). Unfortunately, only 15–20% of animals rescued during Katrina were successfully reunited with their owners (Louisiana SPCA 2016). The unprecedented care and rescue operation at Lamar Dixon Expo Center was aided by the immense support from other organizations like ASPCA, the Humane Society of the United States (HSUS), the San Diego Society for the Prevention of Cruelty to Animals, the Humane Society of Broward County, the Humane Society of Missouri, and the Nebraska Humane Society (Louisiana SPCA 2016).

After Hurricane Katrina, the HSUS was in need of facilities that could house displaced pets and other animals. With the tremendous support of veterinarians, emergency responders, and inmates from the Dixon Correctional Institute (DCI) in Jackson, Louisiana, a temporary shelter was established at DCI (Smith and Unti 2016). This makeshift shelter was used to care for 200 cats and dogs displaced by the hurricane (Smith and Unti 2016). Several weeks later, HSUS, DCI officials, and the LSU School of Veterinary Medicine in Baton Rouge worked together to create the Pen Pals project, and with the help of a $600,000 grant from HSUS, a permanent animal shelter and emergency relief facility was constructed at the DCI (Smith and Unti 2016). The shelter provided the opportunity for veterinary students from LSU to gain practical experience, inmates to care for the animals and develop a sense of personal satisfaction, and homeless pets in East Feliciana Parish to receive care and love (Smith and Unti 2016).

Despite the valiant efforts by welfare organizations and state and local emergency management agencies during Katrina to rescue, evacuate, and shelter animals, as many as 600,000 pets and animals either died or were without shelter. Due to the lack of state and local pet rescue, evacuation, and sheltering plans, many pet owners risked their lives by refusing to leave their animals behind. In a survey conducted by the Fritz Institute in 2005/2006, 19% of individuals (. = 430) that did not evacuate during Hurricane Katrina chose to remain because they did not want to leave their pets behind (Fritz Institute 2006). Many other pet owners did evacuate, but were forced to leave their animals behind. The reasons companion animals were abandoned by their owners include, but are not limited to, unavailability of shelters and hotels that accept companion animals (Zottarelli 2010) and the so-called "No Pets Allowed Policies." Another issue that may have exacerbated the plight of animals was that authorities did not allow pet owners to return to their homes after the storm to care for animals left behind in kennels or homes. It became apparent that the government had underestimated the bond between people and their pets.

Public outcry in the aftermath of Hurricane Katrina led the US Government to reevaluate federal policies with the goal of reducing disaster impacts on pets. Shortly after Hurricane Katrina, Congress passed the Pets Evacuation and Transportation Standards (PETS) Act (42 U.S.C.A. § 5196a–d [2006]). The Act makes it mandatory for state and local governments to include pets and animals in their emergency evacuation plans. Along with the Post-Katrina Emergency

Management Reform Act of 2006 (PKEMRA) and the National Response Framework, the PETS Act is a proactive step to reform the federal government's policy regarding animal evacuation and care during major disasters. Government agencies at all levels are collaborating with private entities and non-governmental organizations to ensure that animals, and their owners, are as protected as possible from emergencies and disasters.

## Animal Care Post-Katrina

In the aftermath of Katrina, the images of non-evacuated pets and anecdotes from volunteers and owners drew attention to the plight of animals. While this was not the first disaster to bring about change in animal policy, it was the first time that household pets and their place in disaster planning were added to federal disaster policy; service animals, while previously supported under separate federal protections, were also specifically addressed. These additions are meant to supplement efforts and resources of state and local actions through changes to the Robert T. Stafford Disaster Relief and Emergency Assistance Act by the PETS Act, PKEMRA, and inclusion of animal care in the Emergency Support Function (ESF) system as defined by the National Response Framework 2008.

H.R. 3858, the PETS Act, was signed into law by President George W. Bush on October 6, 2006. This law was created to amend the Robert T. Stafford Disaster Relief and Emergency Assistance Act to ensure that the needs of household pets and service animals prior to, during, and following a major disaster or emergency are addressed in state and local emergency preparedness operational plans. The Act also allows the Director of FEMA to make financial contributions to state and local authorities for animal emergency preparedness purposes, including the procurement, construction, leasing, or renovating of emergency shelter facilities and materials that will accommodate people with pets and service animals. The PETS Act is operational only after the declaration of an emergency or disaster under the Stafford Act and is mainly focused on reimbursement of eligible expenses (Pets Evacuation and Transportation Standards Act of 2006).

The PETS Act is supported by Disaster Assistance Policy (DAP) 9523.19, Eligible Costs Related to Pet Evacuations and Sheltering. This document identifies "the expenses related to [s]tate and local governments' emergency pet evacuation and sheltering activities that may be eligible for reimbursement following a major disaster or emergency declaration under the Stafford Act" (FEMA 2007). While private nonprofits and contractors are not granted reimbursement directly through this policy, FEMA can reimburse these entities through state and local governments if evidence of services provided is presented (FEMA 2007). To support FEMA and provide additional resources for the inclusion of animals in disaster preparedness and response, the PKEMRA authorizes the provision of rescue, care, shelter, and essential needs to individuals with household pets and service animals. It also seeks to ensure that state and local emergency preparedness, evacuation, and sheltering plans take into account the needs of individuals with household pets prior to, during, and following a major disaster or emergency.

The most sweeping change to federal policy with regard to animals came through the National Response Framework in 2008 that added Emergency Support Function responsibilities caring for household pets. The responsibility of providing for the safety and well-being of pets was designated as part of ESF 11, Agriculture and Natural Resources, through the Department of Agriculture Animal and Plant Health Inspection Service (APHIS). APHIS's mission is to coordinate a multi-ESF response together with ESF 6 (Mass Care, Emergency Assistance, Housing, and Human Services), ESF 8 (Public Health and Medical Services), and ESF 9 (Search and Rescue) to provide for the safety and well-being of household pets as well as provide technical expertise. Transportation of pets is coordinated with FEMA both before and after a disaster. ESF 6, Mass Care, Emergency Assistance, Housing, and Human Services, with the Department of Homeland Security/Federal Emergency Management Agency as the primary agency and the USDA as a supporting

agency, is tasked with the mass evacuation and sheltering of household pets (FEMA 2016).

Medical care for household pets is overseen by ESF 8, Public Health and Medical Services, with the Department of Health and Human Services as primary agency. This provides veterinary public health and clinical subject matter expertise support through the US Public Health Service Commissioned Corps veterinary teams. Also supported are epidemiologists to address environmental public health, toxicology, bite/scratch injuries from animals, and zoonotic disease hazards. The veterinary teams can also deliver animal health care and perform veterinary preventive medicine activities. To assist with veterinary needs, the Department of Defense is a supporting agency of ESF 8 and provides available veterinary military personnel to assist with the medical treatment of animals. Interestingly, while ESF 9 is mentioned in other ESF descriptions as conducting search and rescue operations for household pets, there is no mention of this function in the actual annex of ESF 9 (FEMA 2016).

In 2016, the National Disaster Recovery Framework was updated significantly to include what was previously ESF 14 Long-Term Community Recovery from the National Response Framework. This revised framework is part of the larger National Preparedness System set forth in Presidential Policy Directive, PPD-8, on March 30, 2011. Unlike the National Response Framework, the National Disaster Recovery Framework identifies core principles and key concepts to promote resiliency and provides recommendations to establish support for effective recovery outcomes; it does not give a detailed accounting of lead agencies for specific roles or responsibilities. In the document, animals are frequently addressed in addition to those with access and functional needs, children, older adults, and underserved populations. The only specific mention of animal recovery functions is addressed as the responsibility of recovery management staff to consider the needs of animal owners and caretakers. This is also the only instance in the framework that directs attention to other types of animals, including zoo animals and animals used in research (FEMA 2016).

## Conclusion

It is important for local emergency management offices to work with their respective SPCA or the Humane Society chapter to educate pet owners and care providers on their responsibilities before, during, and after a disaster. In addition, there is also the need to apprise pet owners and care providers about the animal care services available from local, state, and federal government agencies, as well as private organizations and nonprofits. For example, community awareness campaigns can alert pet owners and care providers about FEMA's IS 10 and IS 11 training modules on animal care.

Although all the animal care-related laws passed since Katrina have certainly improved our planning and care for animals before, during, and after a major disaster, there are currently no laws regarding how to reunite rescued animals with their owners. As noted earlier, only 15–20% of rescued animals after Katrina were successfully reunited with their owners. There is a lot of room for improvement in this area. Perhaps, a similar system used by the American Red Cross to reunite family members after a disaster can be developed for animals and owners. The inclusion of community education and resources regarding the use of imbedded microchips to easily identify animal owners should also be considered.

It is paramount for states that do not currently have an Animal Response Team to consider starting one. State Animal Response Teams (SARTs) are multi-agency coordination groups that consist of both government agencies, nonprofits, and private entities focusing on preparing for, responding to, and recovering from disasters involving animals. There are model states such as North Carolina (State Animal and Agriculture Response Teams), Pennsylvania (Pennsylvania State Animal Response Team), and Florida (State Agricultural Response Team). States in need of starting their own SART can adopt the basic framework of SART in existence and modify the framework to fit their local contexts.

Finally, there is still a substantial reliance on NGOs to provide disaster services related to animal care in disaster response. While federal

directives exist, they are not updated regularly and do not address specific issues found during previous disasters (e.g., reunification of pets and owners). At the state and local level, there is difficulty in planning and preparedness activities for pets due to the heavy reliance on NGOs to provide care and the inability of states and localities to direct services provided by outside agencies. As a result, there is no clear explanation on the significant difference between household pets, service, and companion animals. There is a need for federal, state, and local governments to provide guidance on the use of these terminologies.

## Synonyms

Anti-Corruption Commission; Ethics committee; Integrity Commission; Watchdog agencies

## Defining Anti-corruption Agencie

**Anti-corruption agencies (ACAs)** can be defined as a strong public (funded) bodies especially to fight against corruption and reduce the opportunity of corruption in the society through preventive and/or repressive measures. Meagher (2005, p. 70) describes ACAs as "separate, permanent agencies whose primary function is to provide centralised leadership in [such] core areas of anti-corruption activity. . . [as] policy analysis and technical assistance in prevention, public outreach and information, monitoring, investigation, and prosecution." De Sousa (2010) has termed ACAs a new kind of "integrity warrior." Due to their power and independence, integrity theory often sees ACAs as part of a fourth branch of government (Brown and Bruerton 2017). The NIS theory suggests that this

watchdog over executives and other government organs is crucial for maintaining healthy government (Howe and Haigh 2016).

## Development of ACAs

ACAs are one of the most common elements prescribed by isomorphic anti-corruption models around the world. More than half of the countries in the world now incorporate an anti-corruption body in their national integrity systems (Branduse 2016). The ACA model started in 1952 in Singapore and 1974 in Hong Kong. The two oldest ACAs became famous for their enormous success in combating corruption (Johnston 1999; Meagher 2005). These models are later followed by countries like France (1993), Argentina (1999), Botswana (1994), Ecuador (1997), the Dominican Republic (1997), Honduras (1998), and Colombia (1998) (Branduse 2016; Johnston 1999). The final phase of creating ACAs came in the aftermath of the UNCAC from the early 2000s onward, under the auspices of the United Nations Office on Drugs and Crime (UNODC). The international organizations desire to have a separate legal instrument for combatting corruption due to widespread corruption and developed the UNCAC. The UNCAC ratification includes a range of articles and guidelines for countries to prevent corruption. For example, Article 5 of the convention emphasizes the formation of the ACAs and has the authority to monitor in a comprehensive manner (United Nations (UN) 2004). However, drafting and signing of the UNCAC took several years and eventually came into force on December 14, 2005. TI also played a significant role in drafting the UNCAC in force due to their investigative and informative research on corruption (Heimann et al. 2013). Apart from these efforts, the European Union (EU) also promoted ACAs by encouraging its member states to adopt the UNCAC, the Council of Europe Criminal Law Convention on Corruption, and other international anti-corruption laws. In 2011, the EU created its own comprehensive anti-corruption legal framework – the EU Anti-Corruption Report monitoring and policy instrument – to take measures to combat corruption in Europe (Branduse 2016). Since 1990 trend of the ACA laws also likely to emerge significantly (See Fig. 1).

## Typology of Anti-corruption Agencies

Heilbrunn (2004) divided the ACAs into four categories to compare international experience, namely, the universal model, the investigative model, the parliamentary model, and the multi-agency model.

**Anti-corruption Agencies, Fig. 1** Trends in ACA laws, 1950–2011 (Gemperle 2018)

### The Universal Model (The Independent Commission Against Corruption, Hong Kong)

The first is the universal model, typified by Hong Kong's the Independent Commission Against Corruption (ICAC), which has investigative, preventative, and communication functions. Governor Sir Murray MacLehose established the ICAC of Hong Kong on February 15, 1974, during British rule. The ICAC was founded at a time when corruption in Hong Kong was systematic. It took 26 years to become an independent commission from the Anti-Corruption Branch (ACB) as a special unit of the CID of the Royal Hong Kong Police Force (RHKPF) (Quah 2010). Now comprising 2889 (establishment and strength) officers, the ICAC is one of the successful ACAs in the globe with a robust framework. ICAC has developed a unique three-pronged strategy to fight against corruption. The approach is also imitated in the organizational framework, the Operational Department, the Corruption Prevention Department, and the Community Relations Department. The Operational Department is responsible for the investigation. It is the largest and has three fourth of the budget, and workforce is allocated for the department. The Corruption Prevention Department mainly deals with prevention. Therefore, it provides funds to study corruption and organizes seminars and workshops for different stakeholders, including business leaders, private organizations, and citizens. The department conducts research to understand corruption dynamics to prepare or review laws. Finally, community education is the main focus of the Community Relations Department. Therefore, the department builds awareness among people about the legal changes and the risk of corruption. They organize poster campaigning, television commercials, and short films, dramatizing the investigation and apprehension of corrupt officials by ICAC officers (Heilbrunn 2004).

### The Investigative Model (The Corrupt Practices Investigation Bureau, Singapore)

Singapore's CPIB follows an investigative model, which is characterized by a small, powerful, and centralized investigative commission answerable to the executive. The CPIB is one of the oldest anti-corruption agencies in the world. In contrast to Hong Kong's ICAC, CPIB of Singapore took 15 years (1937–1952) to establish (Quah 2010). The CPIB, under the Prevention of Corruption Act (Chapter 241), investigate corruption offenses and other related offenses. However, the Bureau is under the Prime Minister's Office and enjoys functional independence, where the director reports to the Prime Minister. The CPIB is headed by a Director and has three main departments – Investigations, Operations, and Corporate Affairs. The primary function of the CPIB is accomplished by the Investigations Department. The department has separate branches for specific duties. For example, the public and private sector corruption cases are monitored by the Special Investigations Branch (Public) and Special Investigations Branch (Private).

Similarly, money laundering and transnational corruption investigations by the Financial Investigations Branch, day-to-day corruption cases by the General Investigations Branch, corruption trends analysis and crafting investigative policies by the Investigations Policy Unit, and finally the Investigations Training Unit trained the Bureau's Investigation Officers through curriculum planning and conducting specialized courses. The Operations Management and Support Division mainly execute various field operations like arrest and escort accused persons, seizure, and examination of documents. They also assist the Investigation Department through polygraph testing and computer forensics. The Corporate Affairs Department conduct activities like human resource, financial matters, and CPIB's international affairs. The Bureau also operates public education and community outreach efforts to spread the anti-corruption message.

### The Parliamentary Model (New South Wales Independent Commission Against Corruption, Australia)

In the third parliamentary model, the ACA reports to a parliamentary committee and is independent of the executive. The parliamentary model is exemplified by the New South Wales Independent Commission Against Corruption in Australia. In the 1980s narcotics trade from Southeast Asia to NSW raised a serious concern over the communities as the public officials began to receive a bribe

from the drug traffickers. After a series of consultations, the NSW Government established the Independent Commission Against Corruption (ICAC) in 1988 following Hong Kong's success (Heilbrunn 2004). The *Independent Commission Against Corruption Act 1988* ("the ICAC Act") provides enormous powers and discretion to the commission. However, to guard these extensive powers, the ICAC is designed to be accountable through a Parliamentary Committee combining with members from both houses of the NSW Parliament. The performance of the ICAC is monitored by this committee. Like other, the commission has four main divisions: Investigation, Corruption Prevention, Corporate Services, and Legal. Besides, there are also separate Assessments and Communications and Media sections. Like others, the ICAC investigate and expose corrupt conduct, prevent corruption, and educate the NSW community and public sector.

### The Multi-agency Model (United States Office of Government Ethics)

Finally, the multi-agency model spreads anti-corruption efforts among several separate agencies. An excellent example of this kind of model is the United States Office of Government Ethics (OGE). Diversified corruption scandal like Tammany Hall in New York City during the nineteenth century, Teapot Dome, the Lockheed bribery scandals, and Abscam scandals led to the establishment of the OGE to fight bureaucratic corruption (Heilbrunn 2004). Based on the 1978 Ethics in Government Act, the OGE prohibit senior officials from involving in activities that are associated with conflict of interest. The OGE does not have any investigative power, but it cooperates with a variety of offices in the executive branch, including the Office of Management and Budget, Government Accountability Office, and police agencies in the Justice Department to prevent corruption. Therefore, the OGE's role can be characterized as preventative. As a part of a multi-agency model, it defines corrupt practices and informs elected and appointed officials about laws and legal changes that the Congress has passed. Consequently, the OGE tries to improve bureaucratic understanding of laws and regulations (Heilbrunn 2004). The main objective of the OGE is to create an ethical environment by coordinating multi-agency cooperation.

All these ACAs have enormous success in combating and preventing corruption. Therefore, these countries remained as least corrupted countries in the world. Consequently, following one or more of these models, some countries have had very positive results in their anti-corruption drives (Quah 1999). For example, following the universal model, Botswana remained one of the least corrupted countries in the world. Similarly, Lithuania modeled CPIB of Singapore and had notable success. Also, Tanzania followed parliamentary model; India and Argentina adopted the multi-agency approach (Heilbrunn 2004). Some general features and principles which seem essential for the success of ACAs are independence, inter-institutional cooperation, recruitment and specialization, extensive competences and special powers, research capacity, and sustained commitment from the political elite (Meagher 2005; Quah 2013).

## Functions of ACAs: Watchdogs or Guard Dogs

The typology of the ACAs around the world has given a basic idea of their activities. The ACAs may appear in different names but usually undertake three activities: investigation and enforcement, corruption prevention, and corruption awareness and education. These three functions have been drawn from the Hong Kong Independent Commission Against Corruption (ICAC) and Singapore's Corrupt Practices Investigation Bureau (CPIB), which have acted as exemplars of successful ACAs for many other countries (Doig et al. 2006). Among these activities, most of the ACAs emphasized investigation and enforcement. Therefore, ACAs spend much of their budget and personnel on investigation and enforcement. However, ACAs in many countries do have the capacity to enforce power to the people. They had to rely on other government agencies. A widespread debate arises whether ACAs should have its prosecution unit or not. Therefore, researchers around the world nowadays feel much comfortable calling ACAs with weak enforcement power unit as watchdog agencies or "toothless" agencies. Typical watchdog agencies have

**Anti-corruption Agencies, Table 1** Brief comparison between guard dog ACAs and watchdog ACAs (Kuris 2015)

| | Typical guard dog ACA | Typical watchdog ACA |
|---|---|---|
| Role | Investigate, advise, arrest, and/or prosecute | Investigate, advise, draw attention |
| Enforcement powers | Strong | Weak |
| Public profile | High | Low |
| Evidentiary standard | High | Low |
| Disclosure restrictions for on-going cases | Strict | Weak |
| Investigative focus | Criminal violations | Ethical violations, systemic issues |
| Need for safeguards | High | Low |
| Risks | Political manipulation | Irrelevance, importance |
| | Pushback | Dependence on reliable justice system |
| | Competition with law enforcement | |
| Resource needs | High | Low |
| Examples | Latvia KNAB, Croatia USKOK, Indonesia KPK, Hong Kong ICAC | Slovenia CPC, Massachusetts OIG, Ghana CHRAJ, Serbia's ACA |

investigative power, can provide preventative advice or draw attention, but lack prosecution and strong enforcement. Therefore, most of the countries prefer to establish these watchdog agencies. They are politically viable, less expensive, and very easy to manage (Kuris 2015). Especially in developing countries, political parties fell less threatened due to its lack of prosecution power (Table 1).

On the other hand, guard dog ACAs are bigger and aggressive, meaning they possess "teeth" to curb corruption. They are more powerful than watchdog ACAs due to strong law enforcement. Guard dog may impose hefty fines, take away pension, state privilege, keep suspects in prison, and even bankrupt them. Their officials can carry weapons and use their police power when required. New York City's Department of Investigation (DOI), Hong Kong's ICAC, and Singapore's CPIB played key roles as a guard dog to transform less corrupted cities from notoriously corrupt-ridden cities. However, out of many problems, guard dog ACAs need substantial financing, skill, resource, as well as tighter checks and balances to control abuse of power (Kuris 2015).

## Why ACAs Fail in Developing Countries?

In many cases, outside Singapore and Hong Kong, ACAs have had limited success, especially in developing countries (Hindess 2005). Several authors have demonstrated the limitations of ACAs in developing countries. For example, Doig (1995) and Heilbrunn (2004) argued that ACAs in developing countries are fashionable institutions created for the show and not real anti-corruption work. There are several apparent reasons for this failure. Research has identified a lack of political will as one key reason for their ineffectiveness (Abdulai 2009; Brinkerhoff 2000; Johnston and Kpundeh 2004; Persson et al. 2013). Most of the ACAs in developing countries also lack political independence (Lewis and Stenning 2012). Brinkerhoff (2000), in his political will model, explained why a political will is critical in the context of developing countries. He argued five issues to consider while establishing ACAs: (1) locus of initiatives, (2) degree of analytical rigor in anti-corruption solutions, (3) mobilization of stakeholders, (4) application of credible sanctions, and (5) continuity of efforts. When ACAs are established without considering these issues, it might likely fail. Unfortunately, most of the developing countries form ACAs without considering these issues. For example, the Anti-Corruption Commission in Bangladesh was formed in 2004 due to coercive pressure from the donors. As a result, the ACC does fail to mobilize the citizens, and its efforts do not have continuity (Sakib 2019). Similarly, other research found that ACAs in developing countries remain inactive due to a

lack of organizational development, performance expectation and organizational continuity, and differing cycles of donor and government activity (Doig et al. 2006). In many developing country/countries, ACAs have achieved minimal organizational development, although people's expectations remain high. Thus, they have failed to deliver on those expectations (Persson et al. 2013). Therefore, De Sousa (2006, p. 17) interpreted ACAs as "a desperate cosmetic manoeuvre to regain trust from a disenchanted electorate."

## Conclusion

Michael Johnston (1999, p. 225) advised that ACAs are "unlikely to be right for every country." Indeed the creation of ACAs is somewhat blessing for many countries. Nevertheless, an ACA is not a magic bullet that will eradicate corruption in a country. There is a need to combine efforts from the community as well as the policymakers. Citizen awareness is crucial to maintain integrity as they may guard the integrity pillars. Therefore, ACAs in developing countries might follow the universal model of Hong Kong ICAC, engaging citizens to prevent corruption.

# Anti-corruption Institutional Multiplicity Facade in Uganda

Pius Gumisiriza
School of Public Policy and Governance, Uganda Management Institute, Kampala, Uganda

## Synonyms

Anti-corruption agencies; Corruption; Institutional multiplicity; Uganda

## Definition

Anti-corruption institutional multiplicity is defined in this entry as having several agencies fighting corruption in a country at the same time (Carson and Prado 2016).

## Introduction

Uganda established several anti-corruption agencies in its efforts to curb corruption. However, contrary to expectations, institutional multiplicity has failed to effectively curb corruption in Uganda. Using a comparative analytical approach, this entry examines factors within and outside anti-corruption agencies in Uganda that have contributed to their failure to curb corruption. This entry argues that anti-corruption agencies have failed to curb corruption in Uganda because they are not supported with strong anti-corruption laws, there isn't sufficient political will from the political establishment, and the deliberate way anti-corruption agencies were created, structured, resourced, positioned, and supervised has not been effective but rather resulted in wasteful duplication of functions, uncoordinated way of things, blame games, conflicts, and neglect of corruption cases. The entry is structured into three main sections. The first section defines corruption and examines classifications, theories, and effects of corruption. The second section examines anti-corruption institutional multiplicity and gives an in-depth analysis as to why this approach has failed to curb corruption in Uganda. The third section provides conclusions and recommendations.

## Definition and Classifications of Corruption

Corruption has no universally accepted definition, and its meaning usually changes depending on different contexts. However, in this entry, a more precise definition of corruption as the use of public resources or power for private gain is used (Johnston 2010). Corruption is a very complex process intertwined with social, economic, political realities that are constantly changing and must be understood within the context of the environment in which it happens. Therefore, its classification has to be done cautiously to avoid oversimplifying it into a static reality. Nonetheless, corruption has been classified by some scholars in ways that can help in its understanding from different perspectives and thus worth noting. When political power is used to illegitimately convert collective goods into private payoffs, wealth accumulation, status, and sustaining power, it is classified as political corruption.

When private interests significantly influence the decision-making processes of a state, it is classified as state capture. When a regulatory agency charged with regulating a sector advances the special concerns of a particular interest group, it is classified as regulatory capture. When favoritism is exercised in the distribution of legal permits, government grants, special tax breaks, and other forms of state intervention, it is referred to as crony capitalism. When corruption involves small amounts of money, it is referred to as petty and grand when it involves huge amounts of money. When someone who facilitated an illicit transaction is secretly paid, it is classified as kickback corruption. When a public official makes a demand for a bribe payment in relation to an official decision, it is classified as extortion. When perpetuators act in methodical ways as individual persons or groups to commit corrupt practices, it is referred to as systematic. When public officials and private agents collaborate to share the benefits generated from corrupt practices and then move ahead to create a perception that all rules and procedures have been respected, it is referred to as collusive corruption. When corrupt activities are the norm rather than the exception within the everyday structure of society, it is classified as systemic corruption. When civil servants and politicians favor relatives, citizens from the same area of the country, or ethnic groups when exercising their authority, it is classified as patronage corruption (see Søreide 2014). These classifications are not mutually exclusive meaning that they can happen and do happen in the same society simultaneously and evolve within and among societies.

## Theoretical Drivers and Effects of Corruption

There are theories such as the principal-agency theory and the rotten apple theory that have argued that people's individual interests, characteristics, personality, career history, rank, education, experience with corruption, and confidence may be the main drivers of corruption. These theories are grounded in the rational choice theory whose perspective is that individuals rationally participate in corruption when the benefits are greater than the costs (Pratt 2008). However, such theories that focus on individual attributes find a lot of difficulty when it comes to explaining institutionalized and collective corruption that involves larger networks, cliques, acquaintances, patrons, superiors, and brotherhoods. Thus other theories such as the collective action theory, patron-client theory, and social network theory have been advanced to explain the nature and causes of corruption from a social, political, and collective point of view. There is anecdotal literature and evidence, which suggest that corruption may grease the wheels of inefficient and mismanaged bureaucracies especially in developing countries with significant natural resources and that in such circumstances corruption, may potentially improve efficiency and help economic growth. However, there is also overwhelming evidence and research that strongly suggests that corruption can easily distort a country's economy and is one of the greatest obstacles to economic and social development around the world. In the case of Uganda, there is a small clique of individuals who have personally or politically benefited out of corruption. However, the overall impact of corruption on the entire Ugandan society has been detrimental. In 2005, the World Bank estimated that Uganda was losing US$ 300 million to corruption every year. Some observers including Ms. Cissy Kagaba the executive director of the Anti-Corruption Coalition Uganda have argued that this figure may have increased or doubled since then as corruption has been increasing year after year as reported by transparency international and other credible sources in the country such as the Inspectorate of Government. But even if it remained at US$ 300 million reported in 2005, Hon. Nandala Mafabi the former chairperson of the Public Accounts Committee of Parliament has argued that this is enough money to fund and sustain the countries collapsing healthcare system (Mugerwa 2016). Therefore, from this perspective, corruption has been detrimental to Ugandans whether directly engaged in corruption or not.

## Anti-corruption Institutional Multiplicity

Within the anti-corruption literature, the term institutional multiplicity has been adopted to explain the presence or use of several anti-corruption agencies to fight corruption. Using a case study of Brazil, Carson and Prado (2016) have argued that institutional multiplicity can be an effective approach to curb corruption by diversifying avenues through which authorities may detect, investigate, and punish corruption while leaving the old institutions intact thus avoiding raising resistance from those with entrenched interests in the old institutions. They suggest that the success in Brazil can act as a reference for other countries to adopt a similar approach. Other proponents of institutional multiplicity argue that it may help strengthen institutional competition, collaboration, complementarity, and compensation and provides opportunities to see these multiple institutions in action at the same time thus making assessment of their relative effectiveness easier and benchmarking of best practices observed in one institution to be meaningfully transplanted to another institution possible (see Zilber 2011). Critics of institutional multiplicity have argued that it results in wasteful duplication of functions (Weijer 2013) and complex coexistence of contradictory rules of the game in the same territory creating unsolvable conflicts and situations among institutions (Di John 2008).

## Anti-corruption Institutional Multiplicity in Uganda

In Uganda, institutional multiplicity has been a preferred method adopted virtually across the entire government apparatus mainly as a very well-orchestrated political strategy by President Museveni to keep effective control of what happens in government and him a fallback position in case one agency or institution acts or wants to act against his personal or government interests. This technique has been politically successful since every government agency or official is kept working at the mercy of President Museveni (Bukenya and Muhumuza 2017). On the anti-corruption front, the same approach was adopted with the deliberate creation of several anti-corruption agencies. These include the Inspectorate of Government which is the lead national anti-corruption agency with power to investigate, inspect, and freeze bank accounts; search, arrest, and order for production of documents; enforce asset declaration; and prosecute public official involved in corruption; the Directorate of Public Prosecution (DPP) works with the Uganda Police Force (UPF) to investigate and prosecute private and public officials engaged in corruption; the Anti-Corruption Court is responsible to preside over corruption offenses; the Financial Intelligence Authority (FIA) is mandated to combat money laundering activities; the Directorate for Ethics and Integrity (DEI) coordinates policies toward effective anti-corruption efforts; the Office of Auditor General (OAG) audits financial management of central and local government institutions; the Public Accounts Committee (PAC) of Parliament provides oversight functions over management of public resources (Carson 2015). Despite of all the anti-corruption agencies, corruption both petty and grand is endemic across all the levels of government and has been on the increase year after year, and Uganda is now ranked among the most corrupt countries in the world. In 2018, president Museveni ordered that government agencies which duplicate functions be merged with their parent ministries or agencies or be scrapped off altogether. Instead of scrapping off nonperforming anti-corruption agencies or merging them following President Museveni's 2018 directive, he created another anti-corruption unit within State House. Hereunder is an in-depth analysis and discussion of why anti-corruption institutional multiplicity has failed to curb corruption in Uganda.

## Ineffective Monitoring and Supervision Structure

In the case of Uganda, having several anti-corruption agencies has created supervisory challenges among anti-corruption agencies. Some government agencies that are supposed to monitor

and supervise other government ministries were created by and report to the same government ministries that need to be monitored and supervised. This makes them unable to actually supervise the ministries that created and control them. For instance, the Accountability Sector Secretariat is mandated to promote accountability, coordinate adherence to fiduciary assurance, and supervise government ministries so as to combat corruption and improve service delivery. In actual sense, the Accountability Sector Secretariat that is currently housed in the Ministry of Finance, Planning, and Economic Development (MoFPED) premises is the one supervised by the Ministry of Finance. It was the MoFPED that initiated the creation of the Accountability Sector Secretariat, the ministry decides how much money the Secretariat gets in its budget for wage and nonwage, the ministry virtually controls who is recruited in the Secretariat, the ministry determines the activities of the secretariat, all its reports are submitted to the Ministry of Finance, and the secretariat operates in a project mode meaning that its very survival is at the mercy of the ministry. In view of all this, it is practically very difficult for the staff members of the Secretariat to pin officials of the Ministry of Finance to whom they actually report, and ever since its inception in 1998, the Secretariat has never implicated any official in corruption. Therefore, one can argue that the creation and maintenance of the Accountability Sector Secretariat was and still is wastage of public resources without much value for money. Instead of working to reduce corruption, the Public Procurement and Disposal of Public Assets Authority (PPDA) which is mandated to set standards and regulates procurement and disposal activities of Procurement and Disposal Entities (PDEs) across government is made to collude and conceal or constrained to confront corruption because of the way it was also created, mandated, and supervised thus making institutional multiplicity in Uganda's anti-corruption efforts ineffective. The PPDA also started as one of the departments in the MoFPED. It was later granted a vote status to function independently. However, MoFPED retained the PPDA policy formulation and the supervisory functions, while the PPDA just became a regulatory body. MoFPED still influences the PPDA because it determines who heads the Authority and one of its officials must be included on the PPDAs' governing Board. Additionally, PPDA is obliged to conduct procurement audits of PDEs and report to finance, yet MoFPED is also a PDE. This creates a conflict of interest and sometimes results into collusion and hiding of corruption cases other than exposing them. The Financial Intelligence Authority (FIA) that is mandated to prohibit and prevent money laundering in the country is another case in point. FIA was actually started as a project in the MoFPED and later granted a vote status to function independently. However, the so-called independence remains questionable because they still have to be at the whims of the MoFPED for their capitalization, and the Ministry decides how much money FIA can get for their wage, nonwage, and development. In many cases, this acts as a trap because FIA cannot act against the MoFPED on which it depends for its survival. When FIA was created, its directors were drawn from the MoFPED, Inspectorate of Government, Office of the President, and Uganda Police. Given the fact that these were agencies already fighting corruption with limited success, there was nothing new in creating a new agency other than creating more expenditure on the side of government. Therefore, the Anti-Money Laundering Act 2013 could have been more effective if the law was made more stringent and strengthening the Inspectorate of Government and Uganda Police in terms of training and equipping them with tools and technology to track and deal with money laundering. The Internal Auditor General is another example that shows failure of institutions to perform their duties based on how they are formed, structured, and positioned. The Public Finance Management Act 2015 provides that the Internal Auditor General shall oversee the internal audit function across government; develop internal audit policies, rules, standards, manuals, circulars, and guidelines and internal audit strategy; supervise its implementation; review and consolidate audit reports from the votes and externally financed projects; and provide evidence to the relevant parliamentary oversight committees when requested to do so. The

Internal Auditor General is supposed to ensure that all Ministries, Departments, Agencies and Local Governments (MDALGs) accounting officers comply with the internal controls, procedures, rules, and regulation through internal audits. The Internal Auditor General's Office has not effectively performed its function due to the fact that it is structured in such a way that it reports to the Ministry of Finance that is also an MDA. The Internal Auditor General receives report from internal auditors of MDALGs and also reports to the Permanent Secretary and Secretary to the Treasury. In other words, instead of the MoFPED reporting to the Internal Auditor General, it is the Internal Auditor General reporting to MoFPED. Given this kind of structuring, it becomes difficult for the internal auditor to sanction officials from MoFPED in situations of noncompliance or corruption involving them. In other words, instead of the MoFPED reporting to the Internal Auditor General, it is the Internal Auditor General reporting to MoFPED. The Ministry of Finance and its officials are so strong and politically connected that they divert or abuse public money and even when it is revealed, they determine who should investigate them and what the recommendations should be or are aware that they cannot be punished because their actions are done with the knowledge of the highest office in the land. The most recent example of such a scenario is the abuse of a US$ 200 million loan from the Trade and Finance Bank (PTA) exposed by the Public Accounts Committee of Parliament in 2018. Right from its busting, those implicated: Finance Minister Matia Kasaija and Secretary to the Treasury Keith Muhakanizi demanded that they should determine who investigates the matter. Thus instead of PAC carrying out the investigation, they opted for the Auditor General. Thus both PAC and Auditor General have written reports to be debated by parliament and make recommendations for actions on the two officials. In his report to Parliament, Mr. John Muwanga the auditor general cleared Mr. Matia Kasaija and Mr. Keith Muhakanizi over the alleged abuse by noting that all the intended beneficiaries got their share of the money. However, new evidence shows that Mr. Kasaija requested for Shs 41 billion in the Supplementary Schedule No.1 of 2017/2018 to meet the funding deficit for the purchase of essential medicines even after he claimed that the same money was considered as part of the Shs 68 billion. This put into question the independence of the Auditor General's report as it has also been revealed that he was under tremendous pressure from the two to write the report in their favor (Arinaitwe 2018). It has also been known for years now that the executive never implements the recommendations of PAC, which it accuses of political witch hunt and nobody will be surprised if no punishment recommendations will be acted upon.

## Lack of Implementing Powers

While there are many anti-corruption agencies in Uganda, the major ones have failed to reduce corruption because they do not have legal power to implement their findings and recommendation. Key in this category is the Office of the Auditor General (OAG) that has been credited on so many fronts but has no powers to implement its own recommendations and just reports to parliament that has been accused by many commentators for taking a very long time to debate these reports, is itself gagged, engages in corruption, and mainly serves to entrench the interests of President Museveni and his regime. Parliamentary anti-corruption oversight committees also have to make recommendations to the executive for action. It has been noted that over the years, these committees (Public Accounts Committee, Committee on Commissions, Statutory Authorities and State Enterprises, and the Local Governments Accounts Committee) have made significant investigation and exposed serious corruption scandals, but many of their recommendations have been squashed by the ruling party's majority number in parliament or overturned by the presidents' intervention who usually accuse the opposition MPs for turning these committees as avenues for fighting political wars with a purpose to discredit or tarnish the name of government (Bukenya and Muhumuza 2017).

## Political Interference

Many scholars have argued that for corruption to be effectively fought in any country, the different institutions of government must be allowed to carry out their work without interference from the executive and punish anybody implicated in corruption without fear or favor including members of the executive, and this must be backed with strong political will exemplified in actions of political leaders and not mere rhetoric. This argument has been vindicated through many examples, for instance, in Singapore during the leadership of Prime Minister Lee Kuan Yew; any government leader involved in corruption was severely punished without fear or favor. Many senior government officials and close colleagues of Prime Minister Lee Kuan Yew were prosecuted and convicted because of different corruption cases. For instance, in 1975, Wee Toon Boon, a very close friend of Lee Kuan Yew, a loyal non-communist trade union leader, and a minister in the eight ministry of the environment, was charged, convicted, and sentenced to 4 years and 6 months in jail. In December 1979, Phey Yew Kok, then president of the National Trade Union Council and a member of parliament in the ruling People's Action Party, was charged on four counts of criminal breach of trust although he later run into exile at the peril of his sureties (Lee 2011). Tan Kia Gan then minister for the National Development was removed from office for allegedly accepting bribes in connection with the sale of aircraft to Malaysian Airways. Choy Hon Tim the former director of the Electricity Department and Deputy Chief Executive of the Public Utilities Board was convicted and sentenced to a 14-year jail term for his involvement in the $13.85 million bribery scandal; Peter Lim Sin Pang, the former chief of the Singapore Civil Defence Force, was convicted and jailed for 6 months for corruptly obtaining sexual gratification in relation to awarding information technology contracts; and in December 1986, Mr. Teh Cheang Wan then minister for the National Development took his life after failing to influence the CPIB or the prime minister to let him off the hook after revelation of his involvement in corruption (Lee 2011). In other words, Prime Minister Lee Kuan Yew Lee allowed the CPIB to investigate, prosecute, and punish anyone involved in corruption without fear or favor, and this sent a clear signal that you engage in corruption at your own peril. There are countries where institutions maybe embryonic, and in such circumstances, strong political will can help uproot corruption. In the East African region, President Kagame of Rwanda is a good example of a leader whose political will has significantly reduced corruption. In scenarios where top political actors may be culprits in corruption scandals, there need to be strong and independent institutions to make them accountable, for instance, in Brazil, President Dilma Rousseff was impeached in 2016 by parliament because she was able to exercise its mandate without gagging from the executive. In April 2018, former Brazilian President Luiz Inacio Lula da Silva was given a 12-year prison sentence for money laundering and corruption. In 2017, South Korean President Park Geun-hye was removed from office by an independent parliament that voted to impeach her because of corruption. The South Korean constitutional court unanimously upheld the decision of parliament and she was prosecuted. In April 2018, former South Korean president Lee Myung-bak was indicted on 16 charges that included bribery, embezzlement and abuse of power. In October 2018, Lee was handed a 15 years jail sentence for corruption and ordered to pay a fine of 13 billion won ($11.5 m) by the Seoul Central District Court. In 2017, court in Kenya was able to nullify a presidential election won by the incumbent President Uhuru Kenyatta who set the precedent as the first president in Africa's recent political history to accept that decision. This unprecedented court decision was mainly due to the constitutional reforms embedded in the new Kenyan Constitution promulgated in 2010 that gave the judiciary power and protection away from the executive. In the case of Uganda, President Museveni who has been in power for 32 years is effectively in control, influences what happens across government institutions and fights corruption where and when it serves his interests. For instance, during the early 1990s, President Museveni was seriously committed to fighting corruption, and there was

a lot of success in that respect as evidenced in the sacking and prosecuting of key government leaders from office for corruption including his brother who was sacked from the position of army commander. However, starting with the 2001 elections, increased political threats and competition to his position made Museveni to turn a blind eye on the war on corruption, as it became one of the tools through which political power is maintained, reproduced, and consolidated. Thus on many occasions, President Museveni's name has been mentioned in several high-profile corruption scandals, or he has interfered with the work of anti-corruption agencies in defense of his cadres or members of his inner circle (Bukenya and Muhumuza 2017). Museveni's complicity in corruption is not very unique because there is extensive research that shows that in many corrupt regimes, political leaders publicly endorse anti-corruption rhetoric but in actual sense they engage in corruption themselves, protect the corrupt, and have minimal incentives to change the corrupt system because they benefit most from it. The examples of Brazil, South Korea, and Kenya may not happen in Uganda because constitutional reforms that limit the power of the executive while strengthening other branches of government with a purpose of put in places checks and balances, strengthening good governance are not present in Uganda under Museveni's leadership. On the contrary, the Uganda Constitution 1995 gives the president powers to appoint the Chief Justice (Article 142), chairperson of electoral commission (Article 60), Inspectorate General of Government (Article 213), Inspectorate General of Police, the head of public service (Article 173), and Governor Bank of Uganda and Secretary to the Treasury (Article172a) (Uganda Constitution 1995). Because of these constitutional presidential powers, President Museveni has influenced the creation and demise of government agencies, appointment of almost all the judges in Uganda, electoral commissioners, heads of anti-corruption agencies, police, army, and prisons, and in all these scenarios, people loyal to him have been appointed and those hostile removed or sidelined. He has been in power for 32 years now, and as a military man, his real power comes from his effective control and support of the army as echoed by Hon. Evelyn Anite, the State Minister for Finance, Investment and Privatization during the heated confrontations in December 2017 that resulted in the scrapping off of the 75 years age limit from the constitution paving way for Museveni to contest again in 2021.

## Uncoordinated Way of Doing Things

Uncoordinated way of doing things has been true for the case of anti-corruption agencies in Uganda. There are no clear guidelines set for when each anti-corruption agency is supposed to take on a case and that on many occasions officials in several agencies have ended up investigating the same cases making it difficult for the public or other interested stakeholders to identify which agency is accountable for failures to investigate and prosecute specific incidents of corruption. It has also been pointed out that lack of clear-cut guidelines on where each agency starts and ends has in many cases resulted into blame games, conflicts, and neglect of some corruption cases, for instance, on several occasions, the Inspector General of Government Ms. Irene Mulyagonja has blamed the failure to prosecute major corruption cases on the conflict of interest wars between the judiciary, the attorney general, Inspectorate of Government, Directorate of Public Prosecution, and the Police. Mulyagonja told the Members of Parliament on the Legal and Parliamentary Affairs Committee that the trial of former top Public Service ministry officials implicated in the Shs165 billions pension scam hit a dead end after High Court stopped the Directorate of Public Prosecution from including the Cairo International Bank on the charge sheet. The IGG also cited an inquiry she had launched into the disputed procurement of a contractor for the US$ 2.2 billion Karuma Hydro Power Project where the High Court ruled that the Inspector General of Government had no powers to investigate the matter (Bukenya and Muhumuza 2017).

## Dispersion of Limited Finances

Anti-corruption institutional multiplicity in Uganda has resulted into dispersion of the already limited finances into the numerous agencies, and at the end, each agency gets a very meager share, and this seriously affects the execution of each agency's mandate in terms of ability to recruit, train, and equip sufficient numbers of staff with skills and tools necessary to fight corruption. Lack of capacity in terms of finances, human resource, and equipment has sternly constrained asset recovery, affected investigations, and prosecutions which has resulted into long delays, dismissal, or withdraws of corruption cases costing the government dearly, for instance, in the office of the Directorate of Public Prosecutions, 650–750 cases are dismissed every year due to inadequate staff, high staff turnover, and inadequate prosecutorial and investigative skills. In 2010, a review of ongoing cases in the Anti-Corruption Court indicated that 54.2% of cases took more than 12 months to be resolved, while in 2013, for the 85 cases that were ongoing, 34 had been before the courts for more than 24 months, and this number increases year after year. These prolonged cases are caused by lack of enough staff that is also mainly attributable to low pay that has made it impossible for the Directorate of Public Prosecutions to attract, train, and retain competent and highly skilled employees to fill several vacancies for state attorneys. In the Inspectorate of Government, the situation is not different. Lack of sufficient finance, staff, expertise, and equipment has made it impossible for the directorate to verify and enforce the declaration of assets by leaders. As a result, only 50 of declared assets are sampled for verification, and the rest are kept without confirmation for any inaccuracy and inconsistency (Carson 2015). Leaders take advantage of this loophole to under or over declare their assets in anticipation of a future embezzlement because they know that the declaration of assets and liability has become a mere public service norm but without any deterrent effect and the probability of getting them is too low.

## Corruption Within Anti-corruption Agencies

According to several reports from reputable institutions such as the Transparency International, Afrobarometer, Inspector General of Government in Uganda, and Uganda Bureau of Statistics, the Judiciary and Uganda Police are the most corrupt institutions in Uganda, yet they are directed connected with the fight against corruption (Kato 2016). Corruption within these key anti-corruption agencies has hindered effective application of the laws from those expected to enforce it and complicated the war on corruption, for instance, corruption within the Ugandan judiciary has affected the application of anti-corruption sanctions and convicting corrupt officials. Corruption within the judicial takes many forms such as bribery especially among lower-order court clerks who solicit bribes for producing or hiding certain information that is crucial to cases and prosecutors who are bribed to avoid bringing a case forward or to assess evidence in unfair manner, de facto sale of favorable decisions by courts, and selective investigations and prosecutions of corruption culprits. In 2014 alone, the Police Standard Unit (PSU) arrested over 70 police officers over numerous felonies that among others involved extortion, bribery, and concealing exhibits. In March 2017, President Museveni told the country that the Uganda Police has been seriously infiltrated by criminals and specifically singled out the Directorate of Criminal Investigations (CIID) a department that is mandated to investigate corruption but in real practice is highly involved in extorting bribes and kickbacks and assisting corrupt people to avoid prosecution by providing false information or tampering with evidence (Tumwine and Bagala 2017). In October 2017, acting on the directives of President Museveni, the Chieftaincy of Military Intelligence arrested and court martialed several senior police officers that for many years were involved in investigating high-profile criminal and corruption cases. Most of these officers were alleged to be involved in illegal repatriation of refugees back to their countries of origins where they faced danger especially staging armed robberies, kidnapping

people, and demanding ransom from the victims' families, operating private cells. In addition to those arrested, the Police Standard Unit has recommended the sacking of over 80 police officers over misconduct, while a total of 105 officers, both junior and high ranking, are under probe by the Police Standard Unit over cases ranging from extortion to robbery, concealing evidence, fraud, and corruption. The DPP and sometimes IGG depend on the CIID who carry out investigations, and in circumstances where one component fails on its part, services in the other agencies cannot be delivered effectively. The most recent examples include pension scam where government was conned over Uganda shillings 60 billion, but the case was dismissed by court citing government failure to produce even single witness to pin down the suspects, and it was later discovered CIID investigators were bribed to kill off the case (Kato 2016). Police officers and militias affiliated to the ruling NRM party such as Boda Boda 2010 also working with the police have been implicated in many of these scandals, kidnaps, murders, and extortions of bribes. On March 9, 2018, a week after sacking the Inspector General of Police General Kale Kayihura and the Security Minister Major General Henry Tumukunde, President Museveni revealed to the country that bean weevils had infiltrated the police (URN 2018), a metaphor used to mean that the police is full of criminals. For many Ugandans, the president's revelation was no surprise because those that have dealt with the police are very well known that the police is very corrupt as vindicated by many studies (see Kato 2016).

## Weak Anti-corruption Laws and Rule by Law

Its strong laws and the rule of law are strong pillars upon which the fight against corruption can be built upon. An independent, impartial, honest, and competent judiciary is an integral part in upholding the rule of law. Judicial appointments should be made on the basis of clearly defined criteria and by a publicly declared process that ensures equality of opportunity and appointment on merit, progressive attainment of gender equity and the removal of other historic factors of discrimination. For effective corruption reduction to be achieved, corrupt countries need to strengthen their laws relating with punishing corruption, property rights, contract enforcement, and asset recovery, and people should know that the costs of corruption are far higher than its rewards. For instance, in Singapore, during the 1960s, anti-corruption laws were amended to give wide powers to investigators, including arrest, search, and investigation of bank accounts of suspected persons, their partners, children, and agents. Judges were allowed to accept the evidence of an accomplice. Courts were also allowed to treat proof that an accused person was living beyond his or her means or had property his or her income could not explain as corroborating evidence that they had accepted or obtained a bribe. Giving false or misleading information to the CPIB became an offense subject to imprisonment and a fine of up to S$10,000. All these legal mechanisms made corruption a very risky and costly business in Singapore and contributed to its significant reduction (Lee 2011). In Uganda, strong anti-corruption laws are to a bigger extent lacking. Anti-corruption agencies have been let down where mega corruption scandal culprits have gone scot-free because the laws are not wide enough to implicate them or their accomplices; in other circumstances, many have been prosecuted, but the punishment handed down is far much inferior compared to what they gained through corruption. Thus, saved for petty corruption, many people in Uganda with an opportunity to engage in grand corruption are not afraid of the laws. In terms of the rule of law in Uganda, many commentators have argued that what actually exists is rule by law where the will of the strong is meted on the weak or the wish of those in authority is enforced on those in opposition. Anti-corruption laws are applied selectively and mainly used to target dissenting voices, while people can get off the corruption punishment hook if they are in good government books in terms of support (Bukenya and Muhumuza 2017). The appointment of judicial officers is corrupt and influenced by partisan interests. This

undermines the rule of law because judges serve the interests of the appointing authority that in this case is a corrupt government. On the other hand, it is very ironic because while anti-corruption laws are very weak and their implementation is wanting, Uganda also has very strong and prohibitive laws that limit freedom of expression, assembly, and communication, which are ruthlessly implemented, and to some extent limit anti-corruption efforts. For instance, in 2013, the government of Uganda passed into law the Public Order Management Act that provides the police discretionary powers to veto gatherings in public places and break up political meetings of three or more people discussing political issues without prior police permission. Under this law, police has a right to deny or accept permission for people to assemble. The motivation for this law sprung from the fear that the Arab Spring Revolution that saw many long-serving Africans and Arab dictators lose their power would spread southward and inspire regime changes in countries under similar conditions. Indeed, in Uganda, similar situations had begun to evolve under the walk to work demonstrations as opposition political activists had embarked on a walk to work campaign with an aim of forcing government to act on skyrocketing inflation. In return, government used brutal force to crack down on these activists. Security forces harassed and locked up opposition politicians and their supporters who are taking part in a protest. The law allows police to use firearms in self-defense or against those resisting arrest. From then on, the police is always in the daily headlines for the wrong reasons like tear-gassing peaceful demonstrators, beating innocent citizens and journalists, dispersing opposition politicians and activists' rallies, and carrying out abusive, illegal preventive arrests and detentions thus violating people's right to assembly, expression, political participation, and speech (Amnesty International 2014). In addition, the government of Uganda passed into law the Interception of Communications Act 2010 that permits the Minister of Security to tap all forms of communication in the country. The Act provides for the registration of SIM cards and interception and monitoring certain communication in the course of their transmission through telecommunication, postal, or any related service. The stated objectives of the law were to thwart and prevent a terrorism action and organized crime. Undesirably, the law violates a right to privacy and lacks adequate safeguards to ensure respect of rights to freedom of expression enshrined in the constitution of Uganda. Besides, the law gives the government far-reaching discretionary powers in surveillance and interception of electronics, telecommunications, and postal communications between individuals, groups, and organizations. The broad and undefined basis for interception of communication also allows for possible intrusion into communications of individuals and professionals such as journalists, human rights defenders, and political dissidents engaged in legitimate activities and exercising their human rights. The Interception of Communications Act 2010 has had far-reaching impact on human rights and the war on corruption as it is used and abused for other purposes other than the stated one. For example, it has been used to conduct espionage, surveillance, and curtailing dissenting politicians' plans, operations, and organization capacity. The law has curtailed the ability of the opposition politicians and activists to carry out any effective political and anti-corruption work. In addition, this law has made the work of many journalists and their sources very difficult due to the continuous disruptions by state agencies. The government has further used the law to break into people's homes taking them away only suspicious reasons. With such laws in place and their ruthless implementation, it is very difficult for anti-corruption campaigners to hold demonstrations similar to the ones witnessed in Brazil or South Korea in 2016 and 2017, respectively. Even civil society organizations and NGOs that promote accountability in Uganda have not escaped the full wrath of the state as many including international ones such as the Action Aid have had their offices surrounded, sealed off, and closed without warning in 2017 in what the government called operations against enemies of the state, they are just promoting accountability. All these factors limit the emergency of a strong civil society and an assertive population that values and demands accountability, exert

pressure on the leaders to be responsive and accountable to the people they lead, and encourage the formation and reinforcement of legitimate social norms of conduct and fairness which are important social values that contribute to a transition to the rule of law and independent institutions that can operate independently from their leaders. Besides these, telecommunication companies have failed in their role to ensure that every active SIM card is registered using the owner's national identity card or valid passport for the case of foreigners. In the recent example of kidnapping, demanding for ransom and brutal killing of an innocent Ugandan female Susan Magala in March 2018, criminals were using several SIM cards registered in fake names and others unregistered. For over 3 weeks, they tortured and extorted a ransom of over Shs 700 million from the family before brutally murdering her. This exposed a very big lapse in the security system in the country given that it came after a wave of several kidnaps and murders.

## Conclusion and Recommendations

This study concludes that having several anti-corruption agencies is not an end in itself, and they cannot be effective unless they are supplemented with strong laws and political will, a vocal population that is less tolerant to corruption, and constitutional reforms that limit the power of the executive against the other branches of government; anti-corruption agencies must be empowered with both financial and human resources to carry out their work and be able to implement their findings and recommendations, and the monitoring and supervision structure has to be changed such that anti-corruption agencies become independent. In August 2017, President Museveni ordered for a review of government agencies so that many can be scrapped and others merged so as to reduce the current wastage of public resource (Arinaitwe 2017). It is the recommendation of this entry based on the above discussion that anti-corruption agencies be looked into with a purpose of scrapping some and streamline and resource the remaining ones so that they can effectively curb corruption which is affecting everyone in Uganda whether involved in it or not.

## Introduction

In the last two decades, Uganda has come up with several anticorruption measures both homegrown and those domesticated from the provisions of the United Nations Convention Against Corruption and the African Union Convention against Corruption in its efforts to combat endemic corruption. Different parameters used to measure the effectiveness of anticorruption measures indicate that some success has been registered. For example, the Inspectorate of Government (IG) prosecutions increased from 44 in 2006 to 168 cases in 2012 before declining modestly to 145 in 2013. The IG conviction rate also increased from 28.6% in 2006 to 56.25% in 2013 (Inspectorate of Government 2014). However, this does not underscore the magnitude of the problem still at large. Uganda remains one of the most corrupt countries in the world, with most people resigned to corruption rather than stand up against it. This entry discusses different anticorruption measures such as laws criminalizing money laundering, contract rescission (nullity), monetary fines, debarment, asset declaration, whistleblowing, asset confiscation, and why they have achieved minimum success in combating endemic corruption in Uganda. The main argument made is that these anticorruption measures/laws are internally weak and further constrained by exogenous factors such as lack of sufficient political will from the current regime, weak, and dysfunctional institution and lack of capacity in terms of human resources, skills, and equipment to deal with complex grand corruption scandals. Thus, to robustly address the corruption crisis in Uganda, adequate attention must be taken to strengthen the measures/laws already in place so that they can withstand the complexity of sophisticated corrupt actors, ensure that they are fair, accountable, transparent, well publicized, timely, unbiased, and also address the wide political and anticorruption institutional dysfunctions.

## Rescission (Nullity) of Contracts

Rescission of contracts is one of the key anticorruption measures that the current government in Uganda has employed in its fight against corruption. Rescission (nullity) of contracts happens when a contract is cancelled, annulled, or abrogated by the parties, or one of them, thereby restoring the parties to the positions they would have occupied if no contract had ever been formed. The adoption of contracts rescission by governments is a big step toward combating corruption because it entails substantial costs and risks for the bribe-giving party. Contracts induced by bribery and corruption can be annulled either from the beginning or for the future and contracts must be rescinded entirely not just part of

it. A contract is null and void when it can no longer be legally enforced and this entails legal consequences. If one party to the contract gives an indication that it is unable to hold up its end, the other party may claim an anticipatory breach of contract. If the agreement is unconscionable or grossly unfair to one party, or one party commits fraud, the contract may be void. An agreement may also be void if one party is incompetent or a minor and unable to enter a legal agreement, a bilateral mistake is made, it involves restraint of legal proceedings, it is an agreement with uncertain terms, it is a wager or it involves impossible acts (Nell 2008; Lambsdorff 2013). In Uganda, the conditions for rescission of contracts are provided for in the Constitution and different Acts of Parliament. Article 2 and clause 119 (5) of the Uganda Constitution stipulates the conditions to be fulfilled in contract management failure of which would render such a contract or contracts null and void (The Constitution of the Republic of Uganda 1995). The Public Procurement and Disposal of Public Assets Act (PPDA) 2003 stipulates the guidelines and the conditions to be fulfilled under public procurement and the conditions for nullification of contracts. Section 45 of the PPDA Act 2003 requires that Procuring and Disposing Entities (PDE), bidders and providers observe the highest standards of ethics during procurement and the execution of contracts. Also section 55 of the same Act emphasizes the application of rules, guideline, and regulation set out by relevant bodies. Section 93(1) of the same act requires public officers as well as expert engaged to deliver specific service to sign the code of ethical conduct. Therefore, noncompliance with these provisions of PPDA Act 2003 renders a contract illegal, null, and void. According to Sub-Clause 3.1 of the procurement guidelines, the Procuring and Disposing Entity (PDE) may terminate a contract for Supplies if it at any time determines that representatives of the PDE or of a provider engaged in corrupt or fraudulent practices during the procurement or the execution of that contract. Many procurement contracts obtained by way of bribery and/in contravention of public procurement procedures both at central and local government level have been annulled. The most massive example was the annulment of the 600 MW Karuma Hydro Power Dam contract awarded to a company from the People's Republic of China in 2014 because it was done outside the law and the nullification was upheld. However, in many cases, the usefulness of nullity of contract as a deterrent to corruption in Uganda remains ineffective because of political interference and collusion between corrupt actors both individuals or companies and government technocrats to approval contracts that should be annulled. For example, in 1996, the Ugandan Parliament Accounts Committee (PAC) recommended the termination of Swiss Procurement Company (SWIPCO) on the ground of incompetency, irregularities in procurement process, and political interference. However, in 1999, through bribery and connivance with Ministry of Finance officials, the same PAC produced a report that commented favorably on SWIPCO's experience and credentials and recommended them to render services to government.

Nullity of a contract tainted with bribery sometimes leads to renegotiated contracts that are costly, not transparent, failure to recover lost money, massive compensation money, even the renegotiated contracts may be prone to more corruption if the entire system is not cleaned up (Lambsdorff 2013). Indeed, experience in Uganda has indicated that in most cases annulled contracts are renegotiated with the same or other contractors but the government usually picks up an increased bill for the contracts. In 2013, the Karuma Hydro Electric Dam was initially terminated but later renegotiated, costing Uganda US$ 2.2 billion instead of the initial US$ 1.2 billion. In 2014, EATAW an alleged American Company was awarded a contract to construct 75 km road; however, because of fraud in the procurement process, the contract was cancelled and the government lost 24 billion shillings. The renegotiated Kyetume-Katosi Road cost UgShs 254 billion instead of the initial 165 billion. The decision to nullify or staying a nullified contract in Uganda especially government ones that involve huge amounts of money is susceptible to political influence peddling and usually perpetuate corruption rather than deterring it. For instance, in 2014, the

Parliament of Uganda recommended the termination of the contracts awarded to two electric power distribution companies (Eskom and Umeme) due to gross manipulations encountered in the procurement of Umeme concessions and scandalous provisions of the power distribution agreements signed between Uganda and Umeme Ltd. However, the President revoked parliament resolutions and ordered the approval of the contracts. In 2011, Members of Parliament wanted to nullify the contract agreements of an oil exploration and extraction company (Tullow) on the ground that there was no transparency and accountability in the procurement process, and government officials had taken kickbacks. However, the president ordered the Minister of Energy to sign and uphold the Tullow production sharing agreement with Uganda. In 2008, Inspectorate of Government cancelled the tender for the UgShs 312 billion second phase of the National Social Security Fund (NSSF) pension towers due to corruption. In the process, the government lost US$ 16 million in compensation and up to now the construction of the NSSF pension towers has not progressed. In the National Population Data Bank Identification Solution project, the government lost UgShs 205 billion, which had already been used in procurement. In 2006, the National Enterprises Corporation (NEC), which is the trading arm of the Uganda People's Defence Force, signed a mining contract with Dura Cement to mine limestone from the 473-hectare land owned by NEC in Kamwenge and nearby districts. However, President Museveni later ordered the cancellation of this contract because the directors and address of Dura Cement Company were not known. Dura sued the government for loss of business after their contract was given to Hima Cement and demanded $103 million but was paid more than $16 million after negotiations. Another example where annulling a contract has led to massive loss of money by the Ugandan taxpayer involved the compensation of Hassan Basajjabalaba a businessman with close links to the ruling NRM party. Basajjabalaba was compensated UgShs 142.6 billion after his companies contracts to manage four city markets and properties of Nakasero market, Shauriyako market, Constitution Square, and St Balikuddembe market (formerly Owino market) were cancelled by government in 2010 after the market vendors and parliament opposed the move. An investigation conducted by the parliamentary public accounts committee into this matter found that the deal to compensate Mr. Basajjabalaba was highly inflated, much as the businessman informed MPs that President Museveni was aware of what was given to him and that he had personally approved his claim. The Basajjabalaba scandal caused parliament to interdict Syda Bbumba the minister of finance at the time, Khiddu Makubuya, also the attorney general at the time, and Emmanuel Tumusiime-Mutebile, the Bank of Uganda governor, narrowly survived because President Museveni intervened on his behalf (Bukenya and Muhumuza 2017). In other cases, companies may get their contracts rescinded even when they are not corrupt themselves. This happens in cases where such companies are in partnership or joint venture with corrupt partners and end up suffering from nullity of contract. There could also be bribe-paying employees in a company who can make the contracts rescinded if detected thus adversely affecting the profitability and survival of the company (Lambsdorff 2013). For instance, in 1999, Greenland, a commercial bank in Uganda lost its license because it had a joint partnership with a company (Divinity Union) that was involved in many corrupt and money laundering scandals. Rescission is applied to a contract irrespective of the size of corrupt act and a company that paid a small facilitation for obtaining a contract may suffer the same consequences as those involved in big corruption scandals. For example, in Uganda, a falsification of documents, like an academic certificate or tax verification certificate, will earn an individual a loss of contract and some jail time; the same apply to an individual involved in big contracts like road construction with millions of dollars.

## Monetary Fines

Monetary fines are charges imposed on individuals or entities that have been convicted of a

crime. A fine is an amount of money an offender must pay to the offended or for compensation of breach of contracts, rules, or violation of codes of conduct or nonconformity to agreed procedures (Zucker 2004). The size of the penalty is sometimes linked to the contract value or reflects the gravity of an offence, taking into account an enterprise's size, culpability, and other factors such as the harm caused by an offence. Monetary fines also provide a conflict resolution where there is a less stringent burden of proof and they can be revoked without substantially disadvantaging the contractor, the risk of a wrong judgment is thus more fairly shared among the contracting parties. Monetary fines encourage self-reporting as companies strive for leniency. Through monetary fines, resources are shifted from one party to another without further social costs. They are penal in nature, designed to punish misconduct and deter future offences by a defendant. Legislation sets out either a maximum fine or base penalty level and the actual fine will be determined upon consideration of aggravating or mitigating factors (see Lambsdorff 2013). In Uganda, the use of monetary fines as a punishment for corruption has been embraced in different laws spread throughout various statutes. The Anti-Corruption Act 2009 stipulates the punishment for the corruption offences committed. A person convicted of an offence under sections 2, 3, 4, 5, 6,7, 8, 12, and 13 is liable on conviction to a term of imprisonment not exceeding 10 years or a fine not exceeding two hundred and forty currency points (240), or both. In monetary terms, a month of imprisonment is roughly equal to 2 currency points and each currency unit is Uganda Shillings 20,000 (US$ 6). The PPDA Act 2003 prescribes a jail sentence of 5 years and a minimum fine of 5 million Uganda Shillings (US$ 1,700) upon conviction for accounting officers who collude with a firm and award a contract by fraudulent means. New financial penalties have been added in the legislation, and quite often, these have been used as deterrent in engaging in fraudulent practices and committing crimes. According to Anti-Money Laundering Act 2013, an individual who commits a crime under the Act faces between 5 and 15 years in prison or be liable to a fine ranging from UgShs 660,000,000 (six hundred sixty million Uganda shillings only) to 2,000,000,000 (two billion Uganda shillings) (approximately US$ 2,575–780,340). For a legal person, the fine imposed on the entity will range from UgShs 1,400,000,000 (Uganda Shillings One billion four hundred million) to UgShs 4,000,000,000 (Uganda shillings four billion only) (approximately US$ 546,240–1,560,680). The use of monetary fines as corruption deterrent tool comes with several advantages such as easy implementation. In Uganda, police and courts of law are mandated to give out fines for people who commit offences for instance corruption, embezzlement, misuse of public resources, and neglect of duty. Fines collected under this arrangement are then used to improve the welfare of these public institutions (JLOS 2014). Despite of the legal provisions for the use of monetary fines and their continued applications in courts law, various reports indicate that these penalties have not been effective in deterring bribes and corruption prevalence in Uganda. In fact, in some instances, they seem to accelerate corruption because most monetary fines laws are outdated. Monetary fines provided in the anticorruption laws are weak and just a fraction of what is embezzled, for example, a person who embezzle UgShs 18 billion (US$ 5 million), is not required to pay back the money but rather jailed for 3–5 years and sometimes get out on bail. In some cases, individuals and companies who have been fined are left in business and continue with their vices. The financial penalties are scattered throughout various statutes and are not consolidated in any one place and each of them is looked at in isolation of the other. Therefore, it becomes very difficult to track and assess the total impact of such financial penalties on an individual or company. The different anticorruption laws give judicial officers powers to order for compensation or repayment of the money to the owner, but this power can be misused when rules are vague and hardly enforced; officials then obtain sovereignty in interpreting them and may take a bribe. In addition, it is hard to estimate accurately the amount of fines that is sufficiently punitive to deter corruption. If the penalties are not severe enough and

applied each time that inappropriate behavior is detected, they will not be effective in reducing corruption. While it can be argued one should raise the amount of fines and penalties against companies to draconian levels, the intended purpose of fines is forgotten in the process. Sometimes, lack of enforcement of fines has accelerated bribery in Uganda. Cases of asking and accepting a bribe in form of a cash payment in order not to issue a speed fine or reduce the fine are very common in Uganda. Even the fines as prescribed by the current legislations have not kept pace with inflation. Many of the minimum and maximum are now absurdly low, and consequently, it is difficult to assess the total impact of financial penalties on an individual or company (JLOS 2014).

## Debarment

Debarment as anticorruption initiatives has gained momentum and emerged as a noteworthy tool. Debarment happens when company or an individual is formally prohibited from tendering or participating in a project that a government or multinational agency is funding following a finding that the company or individual was involved in the use of corruption to obtain contracts on past or present projects with that agency or government (Moran et al. 2004; Baghir-Zada 2010). Debarment is a restrictive measure; it creates lists of untrustworthy, unreliable, and irresponsible companies and individuals proven that they participated in acts of corruption and preventing their participation in public contracting. Governments and international institutions have developed their own debarment systems to exclude contractors that have committed bribery or fraud or more broadly to exclude contractors that pose unacceptable performance or reputational risks because of bad acts or broken internal controls. In 2005, Transparency International published a list of recommended minimum standards to be applied to all public contracts, blacklisting the companies and debarring them was listed as standard No. 3 (Transparency International 2006). In Uganda, debarment is one of the corruption deterrent measures that has been adopted by the government and provided for in the laws. Section 94 of the PPDA Act and Regulation 351 of the PPDA Regulations empower the Public Procurement and Disposal of Public Asset Authority (PPDA) to suspend providers who do not comply with procurement regulations or guidelines. The PPDA may suspend a provider (business entity) from engaging in any public procurement and disposal process for a period determined by the PPDA. Debarred companies have received suspensions ranging from 1 to 10 years before being allowed to reapply. Suspension is done following the recommendation of an investigation by PPDA. The grounds for suspension include: breach of the Code of Ethics of providers, submission of fogged documents, bid security, sheer negligence, bribery, corruption, shoddy work, abuse of office, general flouting of procurement procedures, and debarment from the procurement process of an international agency of which Uganda is a member. Assessing debarment, as an effective device in the fight against corruption, requires careful consideration of its potential costs, benefits, and the challenges involved during application from perspectives of various stakeholders in the procurement, anticorruption communities, policymakers, and contractors. As an anticorruption device, debarment may encourage compliance with the law because only companies/individuals who act within the laws are supposed to participate in public contracts that in turn may ensure proper use of public resources. Under cross-debarment, when one agency debars a contractor, the other institutions automatically debar that very contractor. This improves anticorruption efforts by multiplying the impact of debarment actions; thus, contractors could potentially face exclusion from many systems and this would mark a significant change in fraud and corruption practices (Yukins 2013). However, debarment and cross debarment practices are not without weaknesses. They have been criticized for being unfair, inefficient paper tigers pretty to look at but not to be feared, poorly publicized, fail to include big companies with proven involvement in corrupt deals, subjected to technicalities such as unwillingness to debar for many reasons such as lack of strong evidence

or lack of a court order and resistance to giving the public access to blacklists (Schooner 2004). However, according to Global Integrity 2011, although companies that violate anticorruption regulations are legally prohibited from participating in future public bids, companies guilty of major violations of anticorruption regulations sometimes bid again using their influence particularly if those companies are politically well connected. At the same time, there is also a risk that a parent or subsidiary company, an agent, a joint venture, a consortium partner, or a subcontractor of the other company can be debarred for the actions of another company over which they had no control and in situations where they were not involved in corrupt conduct. In Uganda, PPDA has the power to blacklist providers and maintains a list of suspended contactors/service providers. Although debarment is provided for in Ugandan laws, debarment of corrupt firms has not been effectively implemented. This is because the process involved in getting a firm debarred is quite long and complicated, and many debarred firms have sometimes been able to circumvent disciplinary measures, including bribing their way back into bidding processes (UDN 2013).

## Confiscation

Confiscation of corruption proceeds constitutes another deterrent that makes corruption less attractive (OECD 2008a). In Uganda, the Leadership Code Act 2002, Anti-Corruption Act 2009, and Anti-Money Laundering Act 2013 confer power to Inspectorate of Government and Directorate of Public Prosecution to freeze, seize, and confiscate proceeds of corruption and make recoveries. Money recovered from investigations and prosecution of corrupt officials or companies is paid directly to the institutions or local governments that had sustained the losses while some money is kept on the Asset Recovery Account maintained by the Inspectorate of Government. However, a critical analysis of the implementation of asset recovery laws shows little progress in making recoveries. This is mainly because corrupt officials register their assets in the names of their spouses, children, associates, relatives, or friends. Investigation of such cases is hard, as it is not provided in the law. This loophole is often taken advantage of by many corrupt public officials who amass illicit wealth and register it in other people's names. Furthermore, the law is not strong enough to criminalize those living beyond their known sources of income. The sanctions provided for under the same laws are so weak to deter someone to be involved in corruption; for example, a person who embezzles US$ 5 million may not pay back the money but rather jailed for 3–5 years. A convicted public official continues to enjoy stolen misappropriated funds and assets after serving his or her jail sentences, which does not reflect the seriousness of their crime or the magnitude of the losses suffered by the state. The confiscation of assets under the current anticorruption legal regime occurs only after conviction at the discretion of the court yet prosecutions leading to convictions are difficult. The value of recovered funds has been low compared to the value of public resources that are misappropriated. In 2007, out of US$ 43,676,471 lost in fraudulent procurement during CHOGM, less than US$ 2,941,176 was recovered. Annually, Uganda loses over US$ 300 million; however, between 2008 and 2011, only US$ 252,920 was recovered while US$ 4,275,499 was saved as the result of investigation (UDN 2013). In 2013, the recovery rate in IG was reported to be merely 21% (Inspectorate of Government 2014).

## Whistleblowing

Whistleblowing and whistleblower protection if well implemented can also be one of the most effective tools in detecting and combating corruption, safeguarding public interest, and promoting a culture of public accountability and integrity (Goel and Nelson 2013). In Uganda, the Whistleblowers Protection Act 2010 was enacted to encourage individuals to blow the whistle on corruption cases, provides protection and monetary incentives for whistle blowing. The Inspectorate of Government (IG) established a hotline where individuals can report corruption

anonymously. However, the whistleblowers protection law remains largely on paper or poorly enforced, thus allowing continued cases of retaliation against whistleblowers. Consequently, most whistleblowers are reluctant to cooperate after receiving threats or fear losing their lives, jobs, and properties yet without testimony of those who can identify high-level officials as the orchestrators of corruption, prosecutors are left with little evidence to convict corrupt officials (Mahoney 2010). For example, in 2012, out of intimidation and fear, all the key 11 prosecution witnesses denied any knowledge of the 3 ministers involvement in CHOGM scandal where UgShs 14 billion was lost to corruption and as a result, the Anti-Corruption Court acquitted the 3 ministers. The lack of a clear system to protect witnesses and insulate prosecutors from bribery and intimidation means that whistleblowers protection law cannot be effective and anticorruption institutions in Uganda have ended up focusing on low-level corruption involving small sums of money, while the big fish have continued to accumulate wealth and power (UDN 2013). It is recommended that government strengthen whistleblowers and witness protection. There is a need to protect whistleblowers not only in law but also in real life by strengthening the Inspectorate of Government to receive and investigate complaints of retaliatory, discriminatory, or disciplinary action taken against whistleblowers and witnesses. And create a more robust system to ensure that quality evidence against high-ranking members of government comes to light under all circumstances.

## Asset Declaration

Asset declaration provides valuable information that helps uncover misconduct and illicit enrichment and ensures that leaders are accountable and that the acquisition of their assets is not through corruption. Successful enforcement requires an effective asset declaration monitoring body with clear mandate, powers, capacity, resource, and authority to receive, process public officials' asset declarations, as well as assess their authenticity, completeness, inaccuracies, and inconsistencies (OECD 2011). In Ugandan, the Leadership Code Act, 2002 mandates the Inspectorate of Government to ensure that leaders and their spouses, children, and dependents less than 18 years declare their incomes, assets, and liabilities every 2 years, and verify them to ensure that they are accurate. It constitutes a corruption act for a leader to be found in possession of assets and income which is disproportionate to the known source of income, and penalty is confiscation or forfeiture to government any excess or undeclared property (Inspectorate of Government 2014). The implementation of the Leadership Code Act 2002 in Uganda has only yielded marginal success due to weakness within the law and lack of capacity in the enforcement agencies. The Leadership tribunal required by the law to implement and enforce the Leadership Code Act has not been constituted leaving the law a mere paper tiger subject to challenge on occasions that the Inspector General of Government has attempted to implement it. In 2014, over 40% of eligible leaders failed to declare their assets and liability and were able to go away with it, even for those who declared, many falsified their declarations. Private individuals who are not leaders within the meaning of the law, presidential appointees, and low staff who may amass a lot of wealth through commission of corruption offences are not required to declare their wealth. Such people continue to enjoy their ill-gotten wealth unchecked. Since the Access to Information Law came into force in 2005, the law cannot be applied to release asset declarations to the public for scrutiny and therefore lacks the potency to prevent illicit enrichment. The Inspectorate of Government lacks sufficient finance, staff, expertise, and equipment to enforce and verify all the declaration. Annually, only 50 of declared assets are sampled for verification and the rest are kept without confirmation for any inaccuracy and inconsistency. Leaders take advantage of this loophole to under- or overdeclare their assets in anticipation of a future embezzlement because they know that the probability of getting them is too low. As a matter of urgency, the Parliament should expeditiously put in place a legal framework for establishing a Leadership Code Tribunal

for arbitration of corruption cases. Amend the law to ensure that all leaders at all levels and public officials become eligible to declare and provide more finance resources, equipment, and training to IG.

## Criminalizing Money Laundering

Money laundering can severely accelerate corruption and organized crime; thus, criminalizing it provides the possibility of courts to hold persons involved in it liable (Schneider 2010). In Uganda, the enforcement of the Anti-Money Laundering Act 2013 has not achieved the desired outcomes because the Financial Intelligence Authority that is responsible for its enforcement is hampered by technical and operational challenges such as limited capacity (finance, human resource, technology, and equipment) and lack of an effective framework to foster collaboration among the different stakeholders. As a result, there are very few successful convictions of money launders given the rising money laundering activities in the country. The effective enforcement is further hampered by the large informal sector that makes it difficult to track and monitor informal financial transactions, widespread use of cash rather than other means of exchange, confidentiality rules in banks and fear to lose customers, poor remuneration which makes officials responsible for detecting and controlling money laundering vulnerable to bribery and lack or poor record keeping (Edopu 2010; Kulabako 2013). As regards to effective enforcement of antimoney laundering, there is need to develop legislative measures to address co-operation in tracing requests and transfer of such property or proceeds and provide resources to improve the capacity of enforcement agencies. The government must also refrain from using the Anti-Money Laundering Act 2013 to thwart the legitimate activities of NGOs, especially those involved in issues relating with the rule of law, governance, and human rights that now being intimidated by the regime.

Besides the above-discussed measures having internal challenges, there are also societal challenges, institution, and political weakness that make the fight against corruption very difficult in Uganda. For instance, civil society organizations that should also play a very active role in trying to ensure that there is better accountability and proper use of public resources are very embryonic, lack the necessary capacity in terms of resources, skills, and insider information of what happens inside the corridors of corruption deal making. As a result, they have not effectively provided enough oversight and held service providers accountable to improve service delivery. There is serious corruption with the key anticorruption agencies, especially the police and judiciary; anticorruption agencies face other challenges of their own such as understaffing, inadequate funding, and equipment, and instead of the political establishment leading the anticorruption crusade, it is part of the corruption problem for self-enrichment and political power consolidation reasons. All these factors put together make the success of anticorruption measures very difficult. The overall recommendation is that there is need for a holistic approach starting from serious awareness and sensitization campaign to the general public to stand up and castigate corruption and its perpetuators. The laws need to be strengthened to make corruption a very costly and prohibitive practice and the political leadership especially president Museveni must walk the talk when it comes to corruption.

# Anti-corruption Policy in Regional Governments, Latin America

Emilio Moya Díaz
Department of Sociology and Political Science, Catholic University of Temuco, Temuco, Chile
Studies Director of Chile Transparente, The Chilean chapter of Transparency International, Santiago, Chile

## Synonyms

Accountability Mechanisms; Anti corruption reforms; Local Governance; Non ethical acts

## Definition

An anti-corruption policy is defined in regional governments as those institutional, normative, cultural and technological actions and measures that together help to reduce the risks and probabilities of corruption within those public institutions.

## Introduction

Before starting the description of the subject, it is important to note that this analysis is the product

of Fondef Project "Consolidation and implementation of a monitoring system corruption risks in regional governments" (Toro et al. 2014), which ran between 2014 and 2015.

Chile has significant legislative progress on transparency and corruption. The entry into force of Law No. 20,285 on access to public information, the creation of the Transparency Council, the creation of the Transparency and Probity Commission, the implementation of the Lobby Law, and the new regulations on political financing have Generated in recent years a legal framework of transparency and access to public information on Chilean public administration and administration.

Beyond the undoubted contribution of these initiatives, there is still corruption problems associated with the functioning of public institutions, particularly in regional and local governments. For example, in a review of cases of corruption and irregularities linked to Regional Governments in Chile (Esperguel and Aguilera 2014), the most frequent crime observed is treasury fraud or embezzlement. This information that seems relevant falls within a universe of only 17 cases registered between 1993 and 2014 through official information provided by the Comptroller General of the Republic and in different media. These cases account for, on the one hand, the low levels of investigation that have been formally carried out during the last 20 years, and on the other hand, there is a low public scrutiny and high levels of impunity that have facilitated the development of a type of corruption silent that the formal systems of denunciation and control of the State have not been able to face. In this context, these bodies are still vulnerable to acts of corruption even if there is transparency regulation. These records highlight the challenges faced by regional governments in the fight against corruption and show how important it is to prevent and anticipate irregular acts that directly affect the quality of life of people due to the misuse of public resources.

The Regional Government in Chile is an autonomous service that is in charge of the superior administration of the region through the formulation of development policies that consider the national guidelines as those formulated from the region itself and its respective communes. It is composed of a Regional Intendent in its capacity as Executive Body and by the Regional Council, which is made up of Regional Councilors and Councilors representing the provinces that the region has; Being elected by popular vote. The Regional Council (CORE) defines and sanctions regional development projects and plans and their modifications, through the allocation of the budget from the National Fund for Regional Development (FNDR). In general terms, the main function of the Regional Government is to elaborate and approve policies, plans, and programs of development of the region. These programs must be adjusted to the national development policy and to the national budget.

An optimal anticorruption policy adopted by regional governments should complement regulatory measures with a tool to prevent the risks of corruption, allowing a timely response to possible irregularities in public management to avoid acts of corruption, whether voluntary or managerial within the agency. Although the transparency law requires the publication of information on the management of the service, it does not guarantee that the process involving such management is transparent or adequate to the standard. In this sense, a preventive tool contributes to the visibility, monitoring, and control of the management of processes and decision making by the public agent. The internal logic of procedures is a matter that the law of transparency does not make visible, and therefore, citizen control in this area is nil. In addition, the Transparency Law does not verify the veracity of the documents produced by the agency and published on its website, increasing the risk of corruption in public management.

In fact, research studies such as Pradenas (2012), Leeuw et al. (1999) show that the incidence of transparency laws and initiatives alone in the control of corruption is low. The first one verifies that the phenomenon of corruption can not be avoided merely by the mere existence of the norm, but that it is important to consider various institutional variables such as degree of formality of processes, political systems, etc. The latter carry out an evaluation of certain administrative, political, and institutional reforms in

certain African countries, showing an important impact of these activities against corruption. Moya et al. (2012) argue that for the Chilean case the transparency of information is not an effective mechanism in generating greater probity in public management. Transparency must be accompanied by information that is friendly of quality and demonstrates its truthfulness.

Under this scenario, the question arises as to how the risks of corruption in public institutions are optimally addressed. As part of the modernization actions of the Chilean State, management indicators have been implemented that show the effectiveness of the objectives established for and by the regional organizations. These management indicators are organized around the lines of action of the modernization agenda: excellence, strengthening, and continuous improvement of public institutions. In this context, a preventive corruption tool contributes to generate specific indicators to measure whether the execution of the processes – even when they are effective – is in accordance with the norms or established goals for their correct performance. The early warning system of corruption risks in management appears as an effective and innovative tool for the control of risks of corruption in regional governments as it allows to anticipate possible irregularities that endanger the integrity of the service and the fulfillment of its objectives.

If the standardization of the internal management of services helps to optimize processes and achieve the objectives proposed by it, the transparency of the processes contributes to optimize the control of the risk of corruption.

## Corruption, Corruption Risk, Risk Monitoring System of Corruption

Corruption is now a central issue in the public agenda of various countries, as it is seen as a complex phenomenon that directly and negatively affects countries' political, economic, social, and cultural development (Donovan 1995; Echebarría 2004). It is specifically considered one of the main factors that affect public confidence, it increases the level of public confidence in the public sector, (Segovia et al. 2008), makes public policies inefficient, generates greater expenditure and loss of state resources (Kaufmann et al. 2000), excludes some sectors of the population, and deepens the levels of inequality at a material and symbolic level, among (Halim 2008; Johnston 2010; Klitgaard 2008; Schloss 2010).

To describe how corruption operates, it is necessary to come up with a specific definition. In this regard, there are many definitions of what is meant by corruption, these come mainly from disciplines such as law, economics, political science, and public administration. The law understands it as that action of a public or private subject that violates the legal norms and violates the obligations of the position, with abuse of position and the purpose of obtaining private personal benefits. The Economy is understood as the abuse by the agent (official or company manager) of the position of the principal (citizenship or shareholders), in which the obligation to ensure the principal's interest in all actions is violated, Putting the self-interest of the agent ahead (Rose-Ackerman 2001). Political Bobbio and Pasquino (2001) science understands it as the phenomenon through which a public official is driven to act differently from the normative standards of the system to favor particular interests in exchange for a reward. Independent of the discipline from which it is defined, corruption is understood as illegal behavior that connotes a violation of a normative and moral standard and involves a conscious act to achieve some particular benefit.

While international organizations such as Transparency International, the World Bank, and the Inter-American Development Bank use a broader definition of corruption, defining it as the use of public office to gain self-profit or abuse of power entrusted to private benefit are definitions that shed much light on how corruption works. Specifically, the revised definitions exclude elements such as the sense that individuals give to these acts, the motivations that drive them, the dynamics they develop, and the links that support them (Moya and Dueñas 2015).

According to authors such as Luhmann (1993), corruption can be explained by the existence of social forms, "such as chains of reciprocity,

interested friendships, patron/client relations and the like" (Luhmann 1998, p. 181). That alienate the resources of the functional systems to support transverse connections and to maintain such networks. They are networks that mostly arise in a context of exclusion and are included informally in the systems, generating that they do not reach their maximum degree of rationalization and bureaucratization. That is, they interrupt the standardized processes of systems and institutions.

These networks operate on the basis of reciprocity and trust. If one wanted to develop this idea in a systemic way, it could be pointed out that the foundation of this network lies in the logic of the self-referential circle, that is, I do what you want, if you do what I want. In other words, whoever wants to achieve something must collaborate. As Luhmann puts it: "The decisive factor to be part of the integrative network is the capacity and the operational disposition dependent on the occupation of positions in functional systems, which are thus used parasitically, short circuited and corrupted" (1998, p. 188).

However, Luhmann points out that these networks have the peculiarity of reproducing themselves through their own operations, that is, these same networks establish mechanisms of exclusion and inclusion that are no longer based on a functional logic of the systems, but are based on the relations of friendship and patronage that establish the individuals among themselves. In this way, it can be pointed out that the networks that form the corruption generate their own mechanisms of exclusion and inclusion. Corruption is a form of inclusive exclusion.

An interesting advance on the definition of corruption is Mujica's delivery (2004). His proposal leaves aside the moral and normative components. This author points out that corruption must be considered as a social phenomenon, since through language and social practices, a space for socialization is possible, characterized by constant mergers and fissions of alliances that allow the implementation and mobilization of strategies and techniques that serve to obtain material or symbolic benefits. It is a phenomenon that surpasses the public by what implies a complex network that extends to different subjects, businesses, activities, and functions. In fact, in corruption, the public-private bond becomes fundamental.

The definition of Mujica is interesting since it incorporates elements such as socialization and social bonds that are key to understanding how this phenomenon operates. However, the pursuit of individual benefit continues to play an important role in the definition, since it is emphasized that any corrupt act can finally be considered a strategic action.

Mujica (2011) criticizes the approaches that conceive of corruption as a political-economic epiphenomenon sustained in incentives and political ambitions (Mujica 2004), since, above all, this must be considered as a phenomenon in itself, a social act with logic and proper sense, because "it does not work in a single sense, but it takes many forms, it is a performative activity that is recreated in action, which makes sense there where practice is a mode of action social" (Mujica 2004, p. 1).

Trying to break with this rational logic of corruption, but incorporating the elements related to sociability and social ties, corruption will be understood as a social practice that breaks the rules and logic of the formal processes of public institutions and services, where material or symbolic goods are obtained, operates through a network of contacts, based on the trust and exchange of favors that are carried out through the interaction of the actors involved in the network (Luhmann 1998; Mujica 2004, 2011; Lomnitz 2003; Auyero 2002; Moya and Dueñas 2015).

From this approach, the development of social links along with the breakdown of formal processes becomes central to understanding how corruption operates. In this way, this phenomenon is understood as a social practice that goes beyond the deliberate attainment of material and symbolic benefits since these can be obtained, but not necessarily because of a rational plan or the conscious search for certain results. Moreover, this definition focuses mainly on factors and logics and not only on the consequences and the end of corrupt acts.

Corruption mobilizes the construction of social networks that make possible the exercise of such an act. In the public sector, these networks of

corruption transcend the bureaucracy characteristic of the public function, making use of the elements of internal management to favor the existence of such practices in a sophisticated and standardized way. Different authors defend the idea that excessive rigidity of bureaucratic processes is a factor that increases the chances of occurrence of an act of corruption, since it favors the use of informal and/or illegal logics for the acceleration of very elaborate codes for the acquisition or delivery of public services or goods that exceptionally concealed their occurrence (Mujica 2011; Rose-Ackerman 2001).

To this type of network, some experts (Mujica 2004; Orrego 2000) call it microcorruption, in the sense that it is "not limited to bureaucracy or public servants or civil servants; but rather involves a more complex framework that extends beyond the walls of public buildings and involves various subjects, businesses, activities, and functions" (Mujica 2011, p. 8). In effect, corruption occurs at different levels and is represented in different forms, depending on the context and locality.

The definition of corruption risk arises as a need to differentiate the risk of irregularity and, in turn, to identify the limits of corruption in the risk. In this sense, the risk of corruption is understood as the susceptibility or probability of an act of corruption to occur. Under this definition, risk is always present. The limitation of this definition is to differentiate the will to commit an irregularity against irregularity as a result of poorly executed management. However, whether or not the irregularity is conscious, this implies the existence of a risk that must be mitigated or controlled.

Among the risks of corruption that more frequently affect regional governments are: there is no regulation on conflicts of interest that can be presented by regional councilors when voting for a particular project, companies that have presented irregularities continue to participate in tenders from regional governments, weak verification on the ground of the execution of public works, public expenditure of regional governments finance private activities, money is used for projects to pay extraordinary bonuses to officials, there are no responsible for processes critical to within the regional governments, little monitoring of the uses of FNDR funds, and little capacity to react to allegations of corruption (Toro et al. 2014). In this context, the risks of corruption in regional governments can be classified as: (a) economic, that is, associated with the fulfillment of institutional goals on budget execution; (b) political, those that are linked to political decisions in the equitable distribution of regional resources, and (c) management, associated with the procedures of each regional investment process.

In this context, the early warning system of corruption risks in management appears as an effective and innovative tool for the control of irregularities in the regional governments as it allows anticipating possible acts that endanger the integrity of the service.

An early warning system should consider the following processes for its construction (Toro et al. 2014).

Step 1. Casuistic Corruption: The challenge is to be able to characterize the most typical corrupt behaviors and their modus operandi. Once identified and characterized, they can be monitored "backwards," that is, reverse engineering. This procedure allows identifying the formal and informal causes that violate the established processes. The question that is asked is: "Given such a concrete casuistry of behavior, what is the process from which this behavior came?" Likewise, through the application of interviews with key actors: Public officials, ex-civil servants, journalists, teachers, businessmen, NGOs, provide complementary information, that is, specific cases of corruption.

Step 2. Determine Criticity: The next activity consists in subjecting the list of findings and causes of corrupt behavior to criticality scrutiny, that is, determining which of them are more or less critical in relation to the conduct of potential corrupt acts. This is achieved through a methodological complement, in which measurable values are associated to each of the found findings. Specifically, a "Critical Scale" will be designed in which

each of the findings is requested to be graded, with a criticality level or scale. Using the Criticality Scale, a rating should be made by associating, for each finding, a value ranging from 1, "no impact," to 5 "maximum impact."

Step 3. Selection and Weighting of Programs Regional Government: Also, since the early warning system aims to offer the design of a set of early warning indicators, it is necessary to select the programs of regional governments, in this regard it is necessary to deploy another methodological complement whose objective will be to weigh the identified findings with each of the regional investment programs implemented by regional governments.

Step 4. Ranking of Findings: A ranking will be made of the findings that will be qualified by their level of criticality and will be weighted with the programs indicated in step 3. The final results of all this activity will be presented in a table called "Ranking of Findings."

Step 5. Process Inventory: The next stage will be weighted by the number of processes that each of the Regional Government programs execute. This step is necessary to be able to associate or weigh the ranking of critical findings, with those business processes representative of such investment programs. In this way, a catalog of processes will be obtained, which will add up to a certain amount of global processes of the selected program.

Step 6. Identification of Critical Processes. This procedure can be separated into three stages:

STAGE I: There will be a ranking of significant critical findings that represent the most likely to be defined as corrupt behavior by agents linked to the processes of the Regional Government's FNDR programs. These findings will be graded according to the criticism level according to the scale designed and will be ranked from highest to lowest level of criticality, leaving a ranking with findings rated with values 5 and 4. Then, it will proceed to cross the ranking of findings for each program. The counterpart team may associate the ranking of findings with each of the selected programs, entering a number 1 (presence) in the case of finding a certain probability that said critical finding may materialize in the form of a corrupt behavior by a agent.

STAGE II: The counterpart team of each of the FNDR programs will then be asked to identify the overall business processes underlying each investment program, resulting in an inventory of business processes. Note that each of these global processes per program will have associated one or more critical findings relieved in Stage I.

STAGE III: Identifying the global process inventory for each of the programs, the next thing to do is to ask the counterpart expert teams to identify in which one or which of the global processes, each of the identified critical which must finally throw a set of critical processes for each FNDR program.

Step 7. Critical Process Modeling: After identifying the critical processes for each of the FNDR Programs, we will proceed to model the flows of the current situation or as is, as a way of documenting each process, using the tool Bizagi Process Modeler.

Step 8. Identification of Critical Activities: The modeling of the critical processes associated with the Regional Government's FNDR Programs will represent the status of how each process is being developed, how it will be managed in practice, and provides a detailed picture of The transversal nature of the process, which departmental areas are involved and how, what activities and tasks are carried out, the decisions faced by the administrative, tactical, and managerial agents in them, etc. So, given this level of detail, it will be plausible to detect, by asking the right questions, which specific tasks are permeable to the undue pressure of internal agents with or without power, in what stage of it does it occur, in what department does such an event occur, etc., so that such corrupt behavior will be identifiable, affecting in this way the route of public investment, in all or part of it, where particular interests are ahead of the social interests involved.

This Step 9. Design of Early Warning Indicators: Once identified concrete and specific activity within the critical process susceptible to undue

pressure by an agent with influence power, the design of one or more early warning indicators, that is, a construct, a mathematical relationship, capable of adequately measuring the corrupt act, yielding an intelligible result capable of being interpreted, and triggering a subsequent control action. Establishment of tolerance thresholds: The idea is to establish values that will be critical to determine what act or process is at risk of corruption. This threshold, associated to a performance indicator, will represent the smallest or tolerable signal that may exist to be warned by a system (application), whereby said program will generate an alert to be taken into account by users Of the system and, consequently, to take specific decisions.

Step 10. Validation and consolidation of Prototype: Finally, a technological application (software) will be developed that will have an attractive, functional, friendly graphic interface design that will allow the monitoring of non-corrupt behaviors associated with the FNDR programs through Indicators Early Warning.

The technological application must relate GORE, program, critical processes, critical activities, and casuistry.

The web-platform application should also ensure the provision of an interactive resource where the citizen can act as a public prosecutor of a GORE and can, in fact, feed the early warning indicator whose collection must be constantly updated. The information and data that will feed and qualify the indicators will be provided by an authorized GORE official, one for each FNDR Program, or natural person (citizen, NGO, inspector). The registry will be hosted on the web platform to which the official (authorized user) will enter with user, password, and other privileges. (This methodology was developed during the execution of the FONDEF project "Consolidation and implementation of a system of monitoring risks of corruption in regional governments" developed and validated by Ladis Parra principal investigator of the project, Sergio Toro Principal Director and Emilio Moya Alternate Director (See Fig. 1)).

**Anti-corruption Policy in Regional Governments, Latin America, Fig. 1** Explaining the construction of monitoring system

## Conclusions

The current problem that regional governments and public agencies generally face is the lack of control mechanisms that prevent corruption in the management of public institutions. Although there is currently legislation that under the principle of publicity obliges public bodies to publish all information they generate and make it available to citizens, this measure is insufficient as it does not prevent corruption and verifies whether the information delivered Is true or not. Specifically, regional governments have complied with the regulations and have also implemented projects to improve the management of public information access systems. This regulation strengthens the mechanisms of transparency of the agencies but does not address the problem of corruption directly.

Currently, regional governments do not have a monitoring system of the characteristics proposed in this section and do not have the tools to prevent irregularities in management. In this context, they remain weak institutions in the face of corruption and, therefore, are exposed to jeopardize their integrity and reliability in the face of citizenship. With the resources available today, regional governments will be able to make available to the public greater information about the management they carry out, they will be able to optimize certain processes but they will remain vulnerable to undue acts, which will generate a discredit and a lack of legitimacy. Indeed, in the project that underlies this definition, it was possible to observe the low level of standardization that exists in the different processes carried out by the regional government, the low degree of control and monitoring of the actions and activities that it executes as well as the absence of those responsible for the critical processes of the institution.

The implementation of this policy aims to develop a system that reduces the risk of corruption in regional governments, which also contributes to the standardization and modeling of relevant processes, to the identification of critical areas that must be observed with special attention, to the construction of indicators that show the behavior of the processes and that can anticipate when they move away from the expected behavior, in addition, it is expected that the decision maker can take action against the alert.

In short, the idea is to generate a process of greater standardization of the management of the regional governments, through a technological platform that prevents corrupt and irregular acts. This is to ensure that regional governments are effective in using their resources both internally and externally.

The advantages of this system are:

Process modeling: The possibility of improving communication within regional governments through process modeling not only helps to detect critical areas of management, but also makes visible the functioning and participation of each administrative division involved in regional government activities. Specifically, it gives account of the times, resources, and officials involved in the management to a detailed level.

Creation of early warning indicators: Survey of early warning indicators that indicate if a certain critical process of the regional government presents an irregular behavior.

Technological system of early warning of risks of corruption focused on the management: Technological tool for the control of risk of corruption. In addition to being a system that monitors corruption risk, you can manage the corruption event once it has happened. This means that it manages the exogenous complaints (citizens and collaborating entities) sending messages and indicating what will be done with that alert and how it will proceed to solve it.

Finally, in order to make progress in the fight against corruption, it is not enough to only implement regulations for transparency and it is also necessary to incorporate policies to prevent corruption. Changing behaviors and practices is a time-consuming process. If public institutions are making progress in modernizing their management, it is possible to think of tools that use early warning indicators to prevent acts of corruption. However, a tool alone does not solve the problem, but it is a key element that helps in the fight against corruption, understanding that this phenomenon violates the formal processes from a predominantly informal dynamic and is

sustained in social bonds of reciprocity that revolve Around trust. The idea of this tool is to standardize processes and generate alerts when there is a risk of corruption, finally, what to do with that risk is a decision of the political authority and therefore not enough technology application to change practices and habits.

## Synonyms

Good Governance; Anti-Corruption initiatives

## Introduction

The phenomenon known as corruption is widely recognized as a social plague that can affect every country in the world. Throughout the years, corruption has affected postcommunist countries (Rose et al. 1998; Rose 2001; Sandholtz and

Taagepera 2005), democracies in transition (Jiménez 2017) as well as free market economies (Rose-Ackerman and Palifka 2016; Cordis and Milyo 2016; Liu and Mikesell 2014).

The visible effects of corruption are just "the tip of the iceberg" of a complex phenomenon. Both the public sector (Anechiarico and Jacobs 1996; Jain 2001; Auriol 2006; Schneider 2007; Auriol and Blanc 2009; Amundsen and Pinto 2009) and the private sector (Argandoña 2003; Lange 2008) suffer from corrupt activities with detrimental outcomes at the national and industry level (Fisman and Gatti 2002; Blackburn and Forgues-Puccio 2007). Corruption reduces economic and social wealth (Dela Rama 2011; Kaptein 2011; Lange 2008) due to the waste of public and/or organizational resources.

It is further useful to think about different forms of corruption in order to identify a full range of possible incidences. "Grand corruption" (Argandoña 2003) commonly implies corruption on a large scale taking place at national level and including central decision makers and politicians. In contrast, "petty corruption" is a form of corruption occurring when "small actors" with limited resources are involved (Rose-Ackerman 1978; Rose-Ackerman and Palifka 2016; Jancsics 2013).

Analyzing corruption in a public-sector context, Jain (2001) distinguishes political (i.e., politicians take advantage of their power), administrative (i.e., citizens try to bribe a public official), and legislative corruption (i.e., individuals influencing the behavior of a legislator) and defines corruption as "the way in which the power of public office is used for personal gain in a manner that contravenes the rules of the game" (Jain 2001, p. 73).

Consistently with the recognition of corruption as a global threat, over the past decades, there has been an internationalization of the fight against corruption, trying to address its cross-border nature. Originally conceived as an unbalance affecting Economic Governance, the fight against corruption was mainly focused on free-market policies aiming to tackle this issue only in international trade transactions. However, as isolated anticorruption initiatives emerged, it was clear that by not addressing the root causes of corruption, they often remained ineffective, while attempts to contain corruption may enable the development of stronger governance frameworks. Indeed, a number of experts (Kaufmann 2005; Mungiu-Pippidi 2013) promote the view that an effective fight against corruption will only emerge if it is understood as a collective action problem. The latter can only be addressed through involvement of multiple actors such as governments, citizen, businesses, and NGOs alike who take collective responsibility. "The key is to help build sustainable collective-action networks around them until the society reaches a reasonable level of normative constraints, so that these corruption fighters no longer remain isolated and exceptional" (Mungiu-Pippidi 2013, p. 114).

This entails conceiving corruption as a Public Governance problem, with governance being looked at as a multilevel process where the micro-, meso-, and macrolevels are interdependent. In particular, as Aguirre (2008, p. 13) argues, "addressing one level of the triad, without ignoring another, renders the entire system ineffectual." Focusing on governance in the public administration domain, the macrolevel concerns the relationship between government and society; the mesolevel is about top managers in the public administration, while the microlevel refers to middle- and project managers in public institutions (Meulenam 2008).

## Antecedents and Causes of Corruption

There is wide range of academic literature reflecting the complex nature of corruption and analyzing its effects (Ashforth et al. 2008; Martin et al. 2007; Rodriguez et al. 2006; Uhlenbruck et al. 2006). Although one can find various definitions of corruption in this literature, most scholars would converge on understanding corruption as the abuse of entrusted power for private gain (Pope 2000; Ashforth and Anand 2003; Tanzi 1995, 1998; Treisman 2000). Thus, corruption is based on the interaction among two or more parties (Ashforth and Anand 2003; Heidenheimer and Johnston 2002), it entails a mutual benefit (Park 2003), and

it includes activities that deviate not only from legal rules and regulatory frameworks (Khan 1996; Nye 1967) but also from widely agreed standards of social behaviour (e.g., with respect to ethical rules; Vaughan 1999; Gibbons 1988; Messick and Bazerman 1996).

A key question arising is what causes corruption, both at the theoretical and empirical levels (De Graaf 2007). More specifically, three macro-categories of causes can be identified: (i) socio-political and legal, (ii) cultural, and (iii) economic factors (Monteduro et al. 2016).

(i) Social-political factors: Electoral systems, freedom of press, population's education level, and the rule of law are key socio-political determinants of corruption. Electoral systems where public officials can be held individually accountable as well as larger electoral districts and open lists are associated with lower corruption (Persson et al. 2003). Kunicová and Rose-Ackermann (2005) argued that incidence of corruption increases in presidential forms of government while parliamentary systems, implying a higher degree of control on the executive branch of government, are less likely to be corrupted. Media engagement is also a key determinant as demonstrated by several scholars with freedom of press leading to lower levels of corruption (Brunetti and Weder 2003; Treisman 2007). Incidence of corruption is expected to decrease when populations are more educated (Treisman 2000; Alt and Lassen 2003; Glaeser and Saks 2006) as civil society plays a watchdog role.

(ii) Cultural factors: Countries' colonial past, gender considerations, and traditions/customs are key cultural determinants of corruption. Many studies focus on the relation between the incidence of corruption and a country's colonial past. For instance, Treisman (2007) argued that former British colonies are less corrupted today, arguably because of the effects of common law. Finally, evidence suggests that traditional customs/habits affected the likelihood of wrongdoing. For example, tax evasion by foreign-owned corporations in the USA are correlated with corruption level of their countries of origins (DeBacker et al. 2015).

(iii) Economic factors: Key economic determinants of corruption are income, funding sources, and civil servants wages. Income is a variable used by many authors to investigate corruption. Nevertheless, its impact on corruption is unclear. While most scholars agree that corruption is lower in richer societies (Treisman 2000; Alt and Lassen 2003; Damania et al. 2004; Serra 2006), others argue that income increases corruption because ethical values decrease during economic booms (Braun and Di Tella 2004). Income distribution also plays a significant role. Paldam (2001) noted a skew income distribution may increase the temptation to make illicit gains. Finally, many empirical studies have highlighted the correlation between civil servants' wages and corruption (Van Rijckeghem and Weder 2001; Herzfeld and Weiss 2003; Beylis et al. 2012).

Second, the mesolevel refers to organizational factors facilitating fraud. Organizations can nudge individual behaviors towards honest or corrupt conduct by clearly identifying right and wrong conduct (Palmer 2012) and simultaneously sanctioning violations of incorrect conduct. For instance, various studies highlighted the detrimental effects of ill-balanced incentive schemes (Osterloh and Frey 2004) and other organizational characteristics which may push individuals towards wrongdoing.

Finally, the "fraud triangle" (Cressey 1950, 1953, 1965; Albrecht et al. 1984) helps conceptualizing corruption at the microlevel. According to the "fraud triangle," for corruption to materialize three elements need to be present simultaneously: a personal motivation, an opportunity to commit wrongdoing, and a rationalization or "justification" of the wrongdoing. Aguilera and Vadera (2007) suggested an analysis of the simultaneous interaction of the three pillars of the "fraud triangle" model, as an antecedent to organizational corruption. Using social identity theory (Tajfel

and Turner 1979), Den Nieuwenboer and Kaptein (2008) have offered another important account of the fraud triangle focusing on three downward organizational spirals. They distinguish between the spiral of divergent norms, the spiral of pressure, and the spiral of opportunity. By presenting corruption as a dynamic rather than a static process, the authors noted how corruption develops over time through the interaction between the three pillars of the fraud triangle. Recently, Schoenborn and Homberg (2016) used the fraud triangle to study bribery tipping as a form of petty corruption.

A further research path revolved around the so-called "bad apple theory" (as opposed to "bad barrels" where the problem is systemic, see, e.g., Arellano-Gault 2016). The "bad apple" literature identified a series of characteristics associated with those individuals who commit wrongdoing. Among those characteristics are lack of integrity (Frost and Rafilson 1989), moral identity (Aquino and Reed 2003; Reed and Aquino 2003), low levels of cognitive moral development (Kohlberg 1969; Trevino 1986; Wasieleski and Weber 2001), as well as a psychopathology (Babiak and Hare 2006). Individual causes of corruption are also associated with the limited cognitive capacity of individuals who fail to recognize the moral nature of situation (Reynolds 2006) or use cognitive scripts excluding ethical dimensions (Gioia 1992).

## Measuring Corruption

Measuring corruption is not an easy task. Most people agree to the fact that it is almost impossible to observe corruption directly. As a consequence, many corruption indices (such as the World Governance Indicators (WGI) or Transparency International corruption index (TI)) rely on (expert) opinions, perceptions, and results from general polls. According to the WGI documentation "Control of corruption captures perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as 'capture' of the state by elites and private interests" (Kaufmann et al. 2011, p. 223). However, such surveys are rather reactive research designs (for a detailed debate see Sequeira 2012; Cole and Ahn 2011) subject to a range of biases most importantly social desirability. While advances towards observing corrupt behavior directly have been made through well-designed experiments (Rabl 2011; Armantier and Boly 2011), archival studies (Cole and Ahn 2011), shadowing bribe givers (Olken and Barron 2009), and ethnographies (Blundo 2007), such studies are still the exception, in particular in cross-country corruption research.

## Linking Good Governance and Corruption

"Good Governance" can be seen as a qualitative measure of how much a governance system is effective, transparent, efficient, and accountable towards its goals, functions, stakeholders, and recipients (Kaufmann et al. 1999; OECD 2006)

This definition highlights the need for sound governance frameworks, capable to address public sector demands and inefficiencies in a more comprehensive way, where sectoral policies are conceived not only as vehicles and components of an overall system, but as better governance enablers.

Within this framework, control of corruption is together with voice and accountability, political instability and violence, government effectiveness, regulatory burden and rule of law, one of the six Worldwide Governance Indicators identified by the World Bank assessing Governance.

In fact, corruption is often a symptom of poor or bad governance (Botchwey et al. 2000), which affects the overall quality of the governance system, becoming in turn a cause. This double nexus means that acting on public corruption has the potential to enable the development of better governance frameworks. Achieving a sound governance framework, in turn, makes anticorruption policies more effective and responsive to broader systemic goals rather than merely focusing on the fight against corruption. In this sense fighting corruption could mean addressing a vicious cycle by nurturing a virtuous cycle.

Recalling the three levels of analysis of corruption (macro, meso, and micro), it is possible to list some of the effects of addressing its causes on promoting sound governance:

- Macro level: Pairing anticorruption policies with good governance reforms at macro level, means achieving a twofold objective. In fact, policies promoting accountability, transparency, and integrity cannot be effective where governance is weak. On the contrary, administrative reforms that call for efficient reform of the public sector, transparent budgeting, and public procurement and enhance participation of the civil society granting disclosure and access over public information are some of the tools used at macrolevel that consolidate the governance pillars while attempting to reduce the opportunities for corruption.
- Meso- and microlevel: Promotion of ethical behavior through the adoption of codes of conduct, performance monitoring and audit committees, are some of the most effective managerial tools to simultaneously reduce corruption and improve organizational governance. Acting on leadership, organization's structure, human resources management, and organizational culture, anticorruption policies become then drivers for better organizational performance within public organizations.

At the national level, making the nexus between governance and anticorruption policies work implies addressing the need for a systemic coordination between the macro-, meso-, and microlevel policies and the alignment of the different subsystems of the organization toward this mutual goal (Fernandez and Rainey 2006).

Fostering the mutual reinforcing link between good governance and anticorruption policies, International Organizations such as the OECD, United Nations, and the World Bank promoted the adoption of Open Government policies and of a Whole-of-Government approach, recognizing the need to adopt coordinated and comprehensive policies that take into account when designing and implementing specific policies (such as anticorruption policies) their interaction with the overall governance system.

## Main International Anticorruption Initiatives

Corruption as a global problem requires global responses. The attention of the International Community towards corruption as a cross-border issue arose during the 1990s focusing on corruption as an International trade transactions issue. In line with this approach, it is noteworthy to mention the "United Nations Declaration against Corruption and Bribery in International Commercial Transactions," adopted by the General Assembly on 16 December 1996, as well as the "Convention on Combating Bribery of Foreign Public Officials in International Business Transactions" signed on 17 December 1997 in Paris by all Member States of the OECD. The convention established legally binding standards to criminalize bribery of foreign public officials in international business transactions. It is the first and only international anticorruption tool focused on the "supply side" of the bribery transaction. Subsequently, there has been a shift in focus due to the limitations of the above-mentioned conventions and based on the recognition that corruption represents a threat to democracy, rule of law, and good governance.

Hence, international conventions and frameworks have tried to adopt a holistic approach, imposing reforms on member States on administrative organization, legality of administrative acts and use of financial resources, legislation for civil servants, competition, and a free market for public tenders.

The United Nations Convention Against Corruption (UNCAC), adopted in 2003, well represents this new approach stressing the importance of preventive and punitive measures in the fight against corruption and including provisions for both the public and private sector. Other relevant international regulatory initiatives are the European Union "Convention on the fight against corruption involving officials of the European Communities or officials of Member States of the European Union" (1997); the Decision of the European Council 2008/801/CE as well as an "anticorruption package" including a "Communication on fighting corruption in the EU" and a decision about the establishment of the EU Anti-Corruption Report. The above-mentioned

instruments rely on similar means to fight corruption by emphasizing themes like preventive measures, criminalization, international cooperation, assets recovery, and technical assistance.

Additionally, the European Council has been promoting a threefold strategy whose main pillars are: the definition of legal principles of "soft law," monitoring progress made by Member States, and their implementation of technical cooperation programs.

In so doing, the European Council works at the intergovernmental and governmental levels. At the intergovernmental level, the Council has adopted the "Model Code of Conduct for Public Officials" and "Twenty Guiding Principles for the Fight Against Corruption," which include a code of conduct for civil servants to be used when elaborating codes of conduct at the national level.

In addition, the "Group of States against Corruption (GRECO)" was established in 1999 by the Council of Europe to monitor States' compliance with the organization's anticorruption standards.

At the governmental level, in 2008 the OECD implemented programs aiming to improve ethical behavior in public organizations, such as the "Principles for Enhancing Integrity in Public Procurement," "Recommendation of the Council on Enhancing Integrity in Public Procurement," and "Recommendation in Principles for Transparency and Integrity in Lobbying" in 2010.

There are a number of international regulatory initiatives. For example, the European Union "Convention on the fight against corruption involving officials of the European Communities or officials of Member States of the European Union" (1997); the "United Nations Convention against Corruption (UNCAC)" (signed in Merida (Mexico) in 2003); and, finally, the Decision of the European Council 2008/801/CE as well as an "anticorruption package" including a "Communication on fighting corruption in the EU" and a decision about the establishment of the EU Anticorruption Report. The above-mentioned instruments rely on similar means to fight corruption by emphasizing themes like preventive measures, criminalization, international cooperation, assets recovery, and technical assistance.

At the informal level, the international community has also implemented some initiatives of "intergovernmental cooperation," such as the Open Government Partnership (OGP). Established in September 2011 through the Open Government Declaration, this partnership involves 45 States and adopted the UNCAC and all international conventions in this field. The OGP aims to enhance transparency in public administration and improve access to information, as well as citizens' participation in decision-making processes to boost flow of information and social networks.

## Conclusion

It is noteworthy to mention that there does not appear to be an integrated theory combining the micro-, meso-, and macrolevels. Fighting corruption and enhancing transparency in public sector contexts can only succeed through collaborative efforts among all involved actors. At the international level, governments need to sign up to and promote anticorruption initiatives. The various public-sector bodies need to enforce rigorously compliance with their codes of conduct and individuals need to understand the detrimental consequences for both themselves and their institutions that can result when engaging in corrupt transactions.

# Anti-corruption War and the Ambivalence of Legalism in Nigeria

John Sunday Ojo
School of Public and International Affairs,
Virginia International University,
Virginia, NV, USA

## Synonyms

Anti-corruption; Corruption; Criminal justice; EFCC; ICPC; Nigerian legal system

## Definition of Terms

| | |
|---|---|
| Plea bargaining | This is a legal principle that allows both the accused and prosecutor to enter into agreements with the aim of getting lesser punishment in exchange for losing assets acquired through illegal means to the state |
| Fiat Justitia Ruat Caelum | Let justice be done even if heaven will fall |
| Corruption | This entails illegitimate diversion and accumulation of public wealth by public officials |
| Anti-corruption | A movement against corruption championed by the government, international organizations, civil society organizations, and NGOs |
| Criminal justice | The existing legal framework that guides and stipulates the necessary punishment for the prosecution of crimes committed by individual citizen |
| EFCC | It is an acronym of Economic and Financial Crime Commission |
| ICPC | It means Independent Corrupt Practices and Other Related Offences Commission |

## Introduction

Corruption has become a philosophical phenomenon in neoliberal and political discourse. Its obnoxious upshot and devastating effects on democratization, economic growth, social well-being, investment, and developmental quest have been discerned across political perimeters. The devastating effects of corruption on the general welfare of the people cannot be deserted. The ominous subsistence of corruption has engendered civil war, deplorable infrastructural development, terrorism, health hazard, and global environmental degradation. Owing to the prevalent damage which corruption has unleashed on human and social development in the world over, war against corruption therefore becomes an epicenter of every political administration. When societies around the world observed the grim corollary of this grotesque syndrome, their actions have been directed toward taming, mitigating, and deracinating the solitude of corruption by damping a web of prosecutorial institutions and campaign outlets aided by national and transnational legal portico in the global political topography. With greater awareness of the colossal effects of corruption on development, strategies to combat it are now the top agenda of global policymakers.

The historical relevance of global anti-corruption institution is sketched to a model established in New York City in the 1890s, followed by a parallel form instituted in Singapore

in the early 1950s, and prototyped by Hong Kong bureau in the 1970s. The subsequent ones around the globe substantiate the awareness of corruption as a fundamental obstruction to effective public administration. A distinctive cognizance of the anti-corruption movement by both less and high corrupt nations in the global north and south continued in the nineteenth and twentieth century (Meagher 2005). Addressing corruption therefore becomes inevitable by devising a mechanism toward establishing temporary or ad hoc anti-corruption commissions which are still predominant in the regions like Europe, North America, as well as Africa. The outcomes of the divergence mechanisms have increasingly supported the war against corrupt political elites and public officials.

A number of regional institutions, international organization, and nongovernmental organizations (NGOs) have champed the fight against corruption. After a series of failed attempt by the United Nations Economic and Social Council to institute the issue of anti-corruption movement before the General Assembly in the early 1970s, the General Assembly implemented a resolution in 1975 geared toward promoting international cooperation against bribery and corruption in the international market. Other international organizations include the European Union (EU), the Transparency International (TI), the World Bank (WB), the International Monetary Fund (IMF), the United Nations (UN), the European Bank for Reconstruction and Development (EBRD), the World Trade Organization (WTO), and the Organisation for Economic Co-operation and Development (OECD). These organizations are gradually incorporating anti-corruption measure and good governance into their mission as a benchmark for lending, borrowing, and humanitarian assistance for the countries soliciting for support around the world. International non-governmental organization like the Transparency International has been concerned with the issue of corruption, and it has been working through its platforms "Bribe Payers Index" and "Corruption Perceptions Index" aimed at creating a world free of corruption and also to ensure that the issue of corruption becomes a forefront of global agenda. The numerous institutions set up to coordinate and manage the illicit cash flow aimed at bushwhack the web of corruption across borders which ensconced the pursuit against corrupt practices.

Following the return to democratic governance in 1999, the Nigerian state led by Olusegun Obasanjo queued on existing international posture, championing the struggle by employing twofold anti-graft agencies – Economic and Financial Crimes Commission [EFCC] and Independent Corrupt Practices and Other Related Offences Commission [ICPC]. This exertion was channeled through legalistic advancement to accomplish the stated goals. Although successes have been recorded in prosecuting some political juggernaut, public officials and private individuals, however, in spite of these exultant struggles, the two institutions have been perplexed with the challenge of legalism in bringing the looters into judgment. The legal foothold employed to curb corruption has sustained unsatisfactory outcomes which constructs a paradoxical rendezvous that sheltered the looters, thereby weakening and thwarting ecological base of anti-corruption movement in Nigeria. It is important to be acquainted with the legalistic power of the EFCC and ICPC which are empowered with prosecutorial competence in the court of law. However, the advancement of legal routine applied in prosecuting the alleged public looters has not been fully ingrained in promoting anti-corruption agenda. Anti-corruption agencies have failed to win many prominent cases against the political and public officials who have economic resources to hire legal luminaries capable of challenging the agencies in the court. It can be observed here that due to inadequate methodical investigative competence, political interference, and inadequate funding to absorb experience legal experts, the agencies have unable to win some of the high-profile corruption cases against the political and public officials in court. Moreover, the legal techniques such as plea bargaining and injunction and other sophisticated legal provisions utilized by the defense counsels have chided the war against corruption. This entry intends to explain the logicality and technicality of criminal jurisprudence that paves way for the corrupt elite class to escape

the wrath of the law which also bewildered effective anti-corruption movement in Nigeria.

## Theoretical Aperture on Corruption

A series of critics have contested the theoretical assumption in contextualizing corruption. Some have offered commonsensical acumen based on the cross-country examples to situate the ecological domain of corruption, while others dwell within the context of cultural realism. Despite the divergence and non-universalistic concurrence, it is important to dampen out the major element of corruption and how it's being perceived at the local and international political climate. One of the approaches put forward in understanding the perception of corruption is the opinion painstakingly affirmed by Rothstein (2011); he claimed that corruption should be considered from principal-agent approach. In this model, corruption is considered as criminal act by some element entrusted to manage public resources. In this approach, the common citizens are the benevolent, while the corrupt politicians are the beneficiaries of the looted funds. In this political environment, it is difficult to single out a principal agent that dissociates from vicious cycle of corruption in the community, "since it makes no sense to be the only honest player" within the convoluted corrupt political prefecture. However, the situational conduct of corruption is also understood within the three different perspectives as it was reviewed by Daniel Agbiboa (2013); he contextualized corruption within the public office perspective, market-centered approach, and public interest-centered. The first considered the use of public office for private gain, while the second articulates a perception of being considered public office as business-oriented outlet by the public servants. The public office is being regarded as a capitalist entity aimed at garner profit. The third conjecture invalidates both the public office perspective and market-centered analysis. It tends to situate the character of corruption within public interest analysis. Nye provides a pejorative entry in defining corruption by aligning its nomenclature within behavioral perspective; according to him, corruption is perceived as deviating from normative rules guiding public office for private gain. Although this is most commonly used in the study of corruption, however, the problematic façade in determining what corrupt practices should connote is centered on the sociocultural explanations of corruption in the divergence societies. Notably, the operational and guiding definition of corruption in western societies may likely contradict what people perceived as corruption in the developing nations of the world. It is against this backdrop that moral standards and legal pedestal appear non-universalistic and, therefore, provide an unpalatable conventional understanding of corruption across the globe (cited in Lancaster and Montinola 1997).

To understand the nature of corruption in Africa, the neo-patrimonial theory explained by Clapham (1985) evidently put it thus:

> Officials hold positions in bureaucratic organization with formally defined powers which are exercised not as a form of public services but as a form of private property relationships of the official with other members of society fall into patrimonial pattern of vassal and lord-lord rather than relational legal one of subordinate superior official behavior is correspondingly devised to play a personal status rather than to perform official functions, the relationship between officials and their clients or underlings is one of personal subordination; state officials treat their posts as personal fiefdom, use them to extract bribes or to appoint relatives; subordinate cannot take official decisions without referring them upwards because to do otherwise would be taken to mean slighting the authority of the boss.

This basic theoretical discourse inherent in neo-patrimonial theory exemplified the contemporary sociopolitical culture in Africa. It defines the very way of life of both the citizens and those in the helm of affairs. The governmental businesses are being employed to serve the interest of the ethnic cabals. In a similar discourse, prebendalism which explains the nomenclature of corruption in Africa also considered how public office is being used to foster exchange of loyalty and patronage between the rulers and political supporters for personal rewards. To have a clear pictorial practices in African politics, several attempts have been made to link the ever-increasing level of

corruption especially among the political capitalists with ethnicity and the institutional legacy established by colonialism. In the context of ethnicity, it is important to recognize the thematic connotation of phenomenon especially in the context of sociopolitical configuration which constitutes a perceptive construct employed by the colonial authority to ease the political occupation in Africa. This conjecture has been attached to sociopolitical arrangement that induces forceful matrimony of diverse ethnic nations, channeled through non-consultative approach, surmised to be exclusive root of Africa's ordeal. Thus, the simulated ethnic configuration infused in the fabric of African sociopolitical psyche by colonialism constitutes a major bane for modern-day sociopolitical mutilation. The social cohesion of ethnic nationalism in Africa was put forward by Osaghae (1995) that claimed to have advanced the predicament of African nations. In line with the above, Ake (2000) concludes that ethnic and identity politics are colonial construct, which remains with the character of African postcolonial state. The resemblance of these institutional legacies imbibes the promotion of selfish interest encapsulated in the colonial governance, synchronized and spiraled by the postcolonial state. Patrice Lumumba is one of the proponents of this school of thought that colonialism engendered and contributes to African dilemma. He believed that the legacy of corrupt governance system board-walked by the colonialist provides a safe haven to accommodate recruited African leaders that become a reality in the post-independence regime (Lumumba 2011). Understanding Lumumba's assumptive view, it can be distinguished that, in the precolonial regime, corruption is an aberration in African political life. The social commonality established in the region before the arrival of white men substantiates and validates how African political community was organized, embracing communalism for collective development in the social arena. Therefore, the delinquency of corruption could be seen as a substance imported, nurtured, developed, and entrenched in the continent of Africa. In the post-colonial epoch, the institution was sustained to breed and promote ethnic self-centeredness, nepotism, favoritism, and what Bayart (1993) fashioned as "politics of the belly." Thus, ethnicity was considered to be a powerful ideological mechanism which adopts to promote corruption by the political elites in Africa. The general posture of electioneering, voting system, and citizen's choice(s) of political candidates dwells within the context of ethnic belonging, thereby coordinating the mode of governance especially at the national level. As theorized by Iwara (2008, p. 33), ethnicity formed the foundation for identity politics and becomes instrumental for "sociopolitical engineering" through which ethnic community claims political power for the benefit of its membership. Osaghae (2003) buttresses this argument; he observed that ethnicity revolves within four arenas, namely, individual level, intragroup, intergroup, and ethnic state. These four arenas provide cadence for ethnic political representatives to influence electoral victories, employment, appointment, and promotion at workplace and admission in higher institution of learning that established the foundation of corrupt political community in Nigeria. The embracement of ethnicity as a potent device to provide social security in the political organism therefore facilitates its entrenchment in Nigerian party politics. The institutional failure and political environment therefore impel to promote corruption as a result of altitudinal temperament and social arrangement that was pigeonholed as national cake for their ethnic cronies and political supporters.

## Nigerian State and Perception of Corruption

Corruption is the main challenge preventing Nigerian state from accomplishing its great potential. It consumes the country's greatest resources, weakening developmental efforts and continuing to affect the daily lives of the poor segment of the population. Nigeria's corruption idiosyncrasies cut across all sectors in both the private and public arena. The corollary of corruption is found in the security sectors especially in the North-East, Lake Chad Basin, Middle Belt, and Niger Delta. The Economic and Financial Crimes

Commission (EFCC) (Establishment) Act delineates corruption within the following:

> non-violent criminal and illicit activity committed with the objectives of earning wealth illegally either individually or in group or organized manner thereby violating existing legislation governing the economic activities of government and its administration and includes any form of fraud, narcotic drug trafficking, money laundering, embezzlement, bribery, looting and any form of corrupt practices, illegal arms deal, smuggling, human trafficking and child labour, illegal oil bunkering and illegal mining, tax evasion, foreign exchange malpractices including counterfeiting of currency, theft of intellectual property and piracy, open market abuse, dumping of toxic waste and prohibited goods, etc.

According to Article 4, Clause 1, of the African Union Convention on Preventing and Combating Corruption and Related Offences, corrupt practices include the following:

(i) The solicitation or acceptance, directly or indirectly, by a public official or any other person, of any goods of monetary value, or other benefit, such as a gift, favor, promise, or advantage for himself or herself or for another person or entity, in exchange for any act or omission in the performance of his or her public functions
(ii) The offering or granting, directly or indirectly, to a public official or any other person, of any goods of monetary value, or other benefit, such as a gift, favor, promise, or advantage for himself or herself or for another person or entity, in exchange for any act or omission in the performance of his or her public functions
(iii) Any act or omission in the discharge of his or her duties by a public official or any other person for the purpose of illicitly obtaining benefits for himself or herself or for a third party
(iv) The diversion by a public official of any other person, for purposes unrelated to those for which they were intended, for his or her own benefit or that of a third party, of any property belonging to the state or its agencies, to an independent agency, or to an individual, that such official has received by virtue of his or her position
(v) The offering or giving; promising; solicitation or acceptances, directly or indirectly; or any undue advantage to or by any person who directs or works for, in any capacity, a private sector entity for himself or herself or for anyone else, for him or her to act, or refrain from acting, in breach of his or her duties
(vi) The offering, giving, solicitation or acceptance directly or indirectly, or promising of any undue advantage to or by any person who asserts or confirms that he or she is able to exert any improper influence over the decision-making of any person performing functions in the public or private sector in consideration thereof, whether the undue advantage is for himself or for anyone else, as well as the request, receipt, or the acceptance of the offer or the promise of such an advantage, in consideration of that influence, whether or not the influence is exerted or whether or not the supposed influence leads to the intended result
(vii) The significant increase in the assets of a public official or any other person that he or she cannot reasonably explain
(viii) The use or concealment of proceeds derived from any of the acts referred to in this article
(ix) Participation as a principal, co-principal, agent, instigator, or accomplice after the fact, or in any other manner in the commission or attempted commission of, in any collaboration or conspiracy to commit any of the acts referred to in this article

The Nigerian corruption is so complex to the extent that no one can actually provide conventional understanding on how corruption is legalized in the public domain. The thought provoking explanation of Daniel Jordan Smith in his book published in 2007 provides sociological and anthropological views of the culture of corruption in Nigeria. Based on his experience in the country, the citizens often pay extra money

for the basic social services that have been provided for free by the government. Other services that public official receives illegal payment include issuance of license, university admission, employment, contract, passport, and birth certificate. The money is usually paid by the citizens in the form of bribe and gratuity so that they can bypass the procedural rules governing the scheme of things as well as getting the preferential treatment. Correspondingly, the kleptocratic nature of Nigerian politics makes Nigerian level of corruption more intense; it is observed that the political elites relied on the looted funds to finance election campaigns and other activities associated with party financing. The other ways through which political parties promote corruption is the selection of candidates against the internal democratic principles that guides the party's routine. During the selection of political contestants, some political parties adopt consensus against popular primary which can be influenced by vote buying. In a situation whereby primary election holds, vote buying becomes the other of the day as the country witnessed in the 2018 gubernatorial elections conducted in Ekiti and Osun states.

Additionally, electoral corruption is another area vulnerable to corruption. Since 1999, electoral corruption has been an epicenter of Nigerian politics as Independent National Electoral Commission INEC determines the winners of an election. The 2007 election that brought Umaru Musa Yar'Adua to power was manipulated by the electoral umpire led by Professor Maurice Iwu – the former Chairman of INEC. It is against this backdrop that Nzeogwu's Declaration of Martial Law on January 15, 1966 captured the current Nigerian dilemma:

> Our enemies are the political profiteers, the swindlers, the men in high and low places that seek bribes and demand 10 percent; those that seek to keep the country divided permanently so that they can remain in office as ministers or VIPs at least, the tribalists, the nepotists, that make the country look big for nothing before international circles, those that have corrupted our society and put the Nigerian political calendar back by their words and deeds. . .

Furthermore, the legislative chambers that are constitutionally assigned to make law, ratify executive appointments, perform oversight functions, and support and strengthen anti-corruption policies are found in frustrating the anti-corruption agencies. In many occasions whereby legislative members are alleged of corruption by the anti-corruption agencies, the legislative chambers perceived its action as political witch-hunting from the Presidency and therefore ensure that the agencies are subverted in its constitutional occupation. The recent loggerhead between the National Assembly and the Presidency regarding the confirmation of appointment of the current Chairman of EFCC can be reckoned with. Due to prosecution of some political bigwigs in the legislative chamber by the EFCC, the National Assembly repudiated the confirmation of the appointment of Ibrahim Magu – the acting Chairman of EFCC. Some of the areas where corruption strives in the National Assembly include padding of budget, skyjacking of constituency project funds, and kickback from the ministries. Legislative corruption is also considered in terms of exorbitant salaries, allowances, and benefits of the individual federal lawmaker. This type of corruption is perfected as the lawmakers assigned whatever they deem fit to enrich themselves. Similarly, the country has witnessed occasion whereby the political figures alleged of corruption are being romanced by the Presidency when his or her political support is needed. This is usually experienced during election period; once the bargain has been sealed, the corruption allegations against the political colossuses are jettisoned by the regime in power. This scenario now raises the question of transparency, integrity, and independence of anti-corruption institutions in the country.

However, the media outlets that would have been the promoter of anti-corruption campaign in Nigeria have been found in several collisions with the politicians. Corruption strives among the journalists in such a way that it takes another dimension in form of gift or transport money from politicians. It is believed that more than 75% of journalists have received such gifts from the political elites. Some publishers and newspaper editors usually receive bribes in brown envelop to conceal any story that may tarnish the image of political office holders. The recent allegation of corruption by the EFCC against DAAR

Communications that the media outlet received $12.4 million during the reelection of President Goodluck Jonathan certified the level of corruption that has entrenched in the psych of Nigerian media outlets. There are a series of factors that facilitate corruption in this arena, including poor salary and remuneration; there is a popular saying that "the music that hunger plays in your stomach makes you deaf to reason." You don't begin to preach ethics to a hungry man. Therefore when journalists are not paid, they are prone to being compromised.

Furthermore, in explaining the perception of corruption in Nigeria, Matthew Page (2018) provides insight on taxonomy of corruption that categorizes corruption from the behavioral perspectives which are interconnected across national and sub-national levels within the Nigerian state. These include political party, media, electoral, legislative, bureaucratic, petro-corruption, trade-related, industrial, agricultural, infrastructural, power sector, financial sector, environmental, defense sector, police, judicial, anti-corruption, educational, health, and humanitarian. It is believed that the culture of corruption revolves around these substantial sectors which provide a difficult environment for any sector in both private and public to be immune of corruption. Together, the various forms of corruption as analyzed in Fig. 1 explain the categorization and divergence areas in public and private sectors within which corrupt practices domiciled in Nigeria.

## The War Against Corruption and Nigerian State: Mechanism and Strategies

There are pragmatic criticisms regarding anti-corruption measures and its legitimacy in defining corrupt practices and the benchmark to determine its practices. In this parlance, anti-corruption movement faces numerous challenges with respect to the unsettled space between the universalism of corruption phenomenon and application of anti-corruption within the local context. Gephart (2009) posits that this contention is fundamental especially because it lies on the political and cultural context in determining what constitutes the public and the private which relatively differs from one cultural environment to another. It is important to note that the contextualization of anti-corruption movement needs to accommodate some certain values in order to work in various areas: first, the cultural understanding that separate what is private from the public; second, the acceptance of local conception and understanding of corruption; and third, the recognition of socioeconomic development stages in some countries which do not guarantee absolute freedom from corruption.

Since Africa has been recognized as a haven for the corrupt public officials, it is not surprising that the region is the target of anti-corruption movement. The evolution of global anti-corruption standards marked a crucial aspect of international political economy. It constitutes an expansion coalesced as the requirement for liberal market economy among the countries of the world. It is also a symbolic exodus from the previous regimes device toward similar outcomes; the synergy provides a precondition for moral compliance in international political economy, focusing on transparency, public accountability, and separation of power justified beyond the jurisdiction of institutional solutions and into the cycle of ethical civilization. The theoretical discourse underscores anti-corruption movement rooted in classical political economy debate of the eighteenth century, a discourse that has been deserted by the rationalist and neoliberal theorists. The nexus of the contemporary anti-corruption campaign is to promote internationalization of liberal thoughts that bifurcates a boundary between an arena of private interactions representing the market and a public domain wherein political options are made and administrative responsibilities are marketed in the interest of the public.

At the commencement of President Olusegun Obasanjo's regime, Nigeria's international political image was brutalized due to astronomical increase in the level of corruption among the political office holders, civil servants, and fraudulent Yahoo boys who based their

**Anti-corruption War and the Ambivalence of Legalism in Nigeria, Fig. 1** Corruption taxonomy overview with categorized examples

professional survival on defrauding the Westerners. The effort to make Nigeria a corrupt-free state was prompted by the global corruption index that placed Nigeria as one of the most corrupt countries in the world published by Transparency International – a think tank international organization concerned with observing corruption at the global scale. The pictographic analysis of the

report of Transparency International which rated Nigeria as the second most corrupt country in the world gingered the establishment of an institution designed to curb corrupt practices in Nigeria. As a result of these events, former President Olusegun Obasanjo established dual institution to checkmate the corrupt practices among Nigerians. Ever since Nigeria's Fourth Republic in 1999, the former President Olusegun Obasanjo developed and made the fight against corruption a fundamental issue in the national public policy. In establishing anti-corruption institutions, most countries developed a combination of specialized and traditional state agencies. Traditional administrative and judicial institutions are considered while building supportive agencies that may facilitate anti-corruption agenda. This similar structure was put in place by Obasanjo's administration that led to creation of Economic and Financial Crimes Commission [EFCC] and Independent Corrupt Practices Commission [ICPC].

The formal inauguration of Independent Corrupt Practices and Other Related Offences Commission [ICPC] took place in September 29, 2000; the institution was legalized under the Corrupt Practices and Other Related Offences Act 2000 (Act 2000). The administrative departments consist of investigation unit, prosecution unit, planning department, research and review units, education and public enlightenment departments, special duties department, chairman's special unit, special investigation team, financial investigation unit, asset tracking and recovery management unit, and intelligence security and support unit. The following figure shows the administrative amalgam of the ICPC (Fig. 2).

The commission was saddled with the following responsibilities under Section 6 of the ICPC Act 2000:

- To receive and investigate complaints from members of the public on allegations of corrupt practices and, in appropriate cases, prosecute the offenders
- To examine the practices, systems, and procedures of public bodies and where such systems aid corruption, to direct and supervise their review
- To instruct, advise, and assist any officer, agency, or parastatal on ways by which fraud or corruption may be eliminated or minimized by them

**Anti-corruption War and the Ambivalence of Legalism in Nigeria, Fig. 2** Administrative structure of ICPC

- To advise heads of public bodies of any changes in practice, systems, or procedures compatible with the effective discharge of the duties of public bodies to reduce the likelihood or incidence of bribery, corruption, and related offences
- To educate the public on and against bribery, corruption, and related offences
- To enlist and foster public support in combating corruption

The Economic and Financial Crimes Commission [EFCC] as a subsequent institution was established in 2003 by the political regime of former President Olusegun Obasanjo; the institution was founded under the Establishment Act 2004, the Money Laundering Act 1995, the Money Laundering (Prohibition) Act 2004, the Advance Fee Fraud and Other Fraud Related Offences Act 1995, the Failed Banks (Recovery of Debts) and Financial Malpractices in Banks Act 1994, the Banks and Other Financial Institutions Act 1991, and Miscellaneous Offences Act. These are various penal codes implemented by the national government to investigate and prosecute economic and financial crimes in the country. During Obasanjo's political era, Mr. Nuhu Ribadu was appointed as the Chairman of the commission. According to Nuhu Ribadu, the former EFCC Chairman:

> Since the founding of the EFCC till date there are more than enough examples to illustrate the culpability of public officials who abused the process, there are cases of serving ministers offering bribes to pass budgets, cases of permanent secretaries who compromise themselves through outright theft, cases of ministries where deals were made of salaries and numerous abuses at state level of the ecology fund, fertilizer scams and other examples of sleazy practices in government. (Ribadu 2004)

After the expiration of Obasanjo's political administration, another election was conducted which pronounced the emergence of Umaru Musa Yar'Adua, as a new elected President of the country. One of the incongruous restructurings of the administrative leadership of the EFCC carried out by Yar'Adua's regime was the firing of the former EFCC Chairman, Nuhu Ribadu. It is believed that Mr. Nuhu Ribadu was kicked out by the President as a result of probing of one of his political allies, James Ibori, the former Governor of Delta State. The dismissal of the EFCC Chairman led to the installation of Farida Waziri as a new Chairperson of the EFCC.

Following the demise of Ya'Aradua, Goodluck Jonathan became the new elected President of the Federal Republic of Nigeria. The then President followed the trend of his predecessor; he replaced Farida Waziri with Ibrahim Lamorde as a new anti-corruption czar. Several cases of corruption were carpeted, while the EFCC was silenced by the regime. The corruption allegations against the regime that include the case of Stella Oduah, the former Minister of Aviation, and Abdulrasheed Maina, Chairman of Pension Reform, among others, are good examples of how the battle against corruption was lost during the regime.

The subsequent presidential election pronounced President Muhammadu Buhari as a newly elected President; his emergence provides another ecological limpidness for anti-corruption campaign in Nigeria. One of his precedence campaign pledges includes tackling corruption in the country. In tandem with his campaign agenda, President Muhammadu Buhari challenged some of those that were alleged of looting state resources through the instrumentality of EFCC under its new Chairmanship – Ibrahim Magu. According to President Muhammadu Buhari:

> Corruption is a cancer which must be fought with all the weapons at our disposal. It corrodes the very fabric of government and destroys society. Fighting corruption is Key, not only to restoring the moral health of the nation, but also to freeing our enormous resources for urgent socio-economic development. (Vanguard Newspaper, May 27, 2017)

Among the prominent cases championed by the Buhari's regime is Dasukigate which implicates the former President Goodluck Jonathan and some of his cabinet members in arms procurement scandal. Under the current political regime of President Muhammadu Buhari, some policy measures aimed at curtailing corruption tendencies were implemented; these include policy of whistle-blowing deliberately put forward to encourage Nigerians to expose and report corruption-related crimes to the relevant

authorities with a compensation of 5% of the recovered loot. Besides the whistle-blowing policy, the government further implemented Treasury Single Account [TSA], Presidential Advisory Committee Against Corruption, and Bank Verification Number [BVN] policies aimed at checkmating corrupt practices within the Nigeria domain. The TSA, in particular, aimed at providing a single purse for all government revenues in order to avoid multiple banking system practiced in the past that allowed public officials to siphon public resources. These are national policies superficially arranged to quell the hauteur of corruption. Anti-corruption reforms are now becoming a national political inevitability by enchanting, advocating, and supporting good governance which has continued to materialize from the grass-roots civil society organizations, NGOs, and advocacy groups.

## Criminal Justice System, Plea Bargaining, and Anti-corruption Crusades

It is believed that Nigeria inherits the existing legal system from the British colonial administration. Some of its principles are based on English common law and legal practice, and it has been utilized to manage the sociopolitical affairs of the nation in the postindependence regime. At this point, it is important to queue from this historical memory lane that guides Nigerian criminal justice system and understand what plea bargaining is, which serves as an instrument for anti-corruption campaign in Nigeria. According to the *Black's Law Dictionary*, plea bargaining implies a process whereby the accused person and the prosecutor in a criminal case work out a mutually satisfactory disposition of the case, subject to court approval. The origin of plea bargaining can be traced to the United States. It is found in the Middlesex County in Massachusetts between the years 1780 and 1900, and it was often applied in the legal proceeding of unlicensed liquor selling. The accused is offered plea bargain whereby the various charges leveled against the accused are reduced to one charge with a specific court sentence and fine.

The application of this concept sought to solidify negotiation between the defendant through his or her legal counsel and the prosecution in which the defendant allows to plead guilty in exchange for minor punishment. It can also be considered as an agreement offer by a prosecutor which provides opportunity for the accused person to plead guilty, often employed as an incentive and requirement for lesser punishment amidst multiple charges leveled against the accused person. The advantages of plea bargaining are conceived under criminal justice believing as an essential tool that can be used to reduce the workload and unnecessary delay in the administration of justice. There are three types of plea bargaining; these include the charge bargain, sentence bargain, and fact bargain. First, the charge bargain implies a situation whereby the prosecutor allows the defendant to plead guilty to a lesser charge against him or her. It is often negotiated in the pre-trial stage of the case. Second, a sentence bargain is usually introduced when the accused is foretold the nature of the sentence if he or she pleads guilty. The third one is fact bargain which entails the admittance of certain facts by the accused person in agreement with the prosecutor not to expose these facts as evidence before the trial court. In some countries like Australia, the United States, and the United Kingdom, the accused person may be allowed to enter into agreement with the prosecutor to plead guilty to some charges while the prosecutor drop the residual charges.

In Nigeria, the reflection of plea bargaining can be found in Section 14(2) of EFCC Act. The concept has been applied in many high-profile corruption cases where the accused persons are given opportunity to plead guilty after they have agreed to forfeit some of the assets acquired through fraudulent means especially the one possessed through the diversion or embezzlement of state resources. Some of the high-profile corruption cases that have benefited from plea bargaining include the case of former Chief Executive Officer of Oceanic Bank, Cecilia Ibru, who was charged on economic and financial crimes. Amidst 25-count charge, the accused was offered plea bargain with the opportunity to plead guilty

to a lesser 3-count charge. The accused was convicted on three-count charge with the forfeiture of her assets worth 191 billion Naira. Thus, she was sentenced and imprisoned for 6 months. Another reference to plea bargain is the case of former Governor of Bayelsa State, Alamieyeseigha, who was sentenced by the court to 12 years in jail. The accused was charged on six-count charge related to financial and economic crimes which amounted to 2 years per charge. Following this ruling, the EFCC offered plea bargain to the accused which allowed him to plead guilty to the charges. In his ruling, Justice Mohammed Shuaibu of the Federal High Court in Lagos State states that:

> in respect of the properties in the Charge Sheet (Information Sheet), they are hereby forfeited to the Complainant (Federal Republic of Nigeria). The proceeds after sale would be forfeited to Bayelsa State couple with six months imprisonment

The accused was released after he has spent nearly 2 years in prison. Furthermore, the corruption case against Mr. Tafa Balogun, the former Inspector General of Police, also serves as a good example when dealing with plea bargaining in Nigerian criminal jurisprudence. Following the acceptance of plea bargain by Mr. Tafa Balogun, he was sentenced to just 6 months in prison while his properties were confiscated by the state. A typical case of the former Governor of Edo State, Lucky Igbinedion, who was alleged of financial impropriety followed similar deportment. The accused person was alleged of looting 4.4 billion Naira believing to be public funds and the arrays of properties bought within and outside the country with the state resources. In his judgment, Justice Abdul Tafari of the Federal High Court in Enugu pronounced that the former Governor should pay a sum of 3.5 million Naira as a fine against the huge looted funds.

However, the concept of plea bargaining is alien to Nigerian criminal jurisprudence, according to former Justice of the Supreme Court, late Justice Kayode Eso:

> There is no plea bargaining in the Nigerian legal system, and that it was wrongly imported, it is even a corruption to import the concept of plea bargaining into the Nigerian legal system.

In similar direction, the former Chief Justice of Nigeria, Justice Dahiru Musdapher, opined that:

> The concept is not only dubious but was never part of the history of our legal system at least until it was surreptitiously smuggled into our statutory laws with the creation of the Economic and Financial Crime Commission.

The major benefactors of Nigerian criminal justice systems are the rich, powerful, wealthy, and those in the helm of political affairs, while the poor are treated as criminals. Although, in every civilized society, criminal justice system is considered to be a rehabilitative, protective, and corrective abode for the convicted criminals, the Nigerian criminal justice system has continued to breed more criminals and serve as a center stage for corruption. One of the provisions put in place to shield the corrupt political class from going to prison is plea bargaining, and this instrument has been applied in many corruption cases in Nigeria. The legal approach is constructed by allowing powerful political or public office holder alleged of corruption to return some of the looted funds to the government, once the person return part for the loots, the gravity of the punishment could be reduced. This legal approach toward fighting corruption aimed at preserving the powerful political class serves as an escape route for the looters to get away with the public resources. This reflects an array of bias design to serve the powerful and the rich political class while criminalizing the misdemeanor of the poor, downtrodden, and the most vulnerable in the country. Some of Nigerian poor citizens are groaning in the Nigerian congested prisons, while the rich are being provided with plea bargaining to continue with their daily lives after some of their assets have been confiscated by the state. It is in line with the above that it was argued somewhere that:

> Nigeria is a country of paradoxes, one in which the VIP steals an elephant and runs away with it but the poor man stealing a goat goes to jail for up to 30 years. (Sahara Reporter May 26, 2016)

A number of Nigerian political class and public figures have used plea bargaining to escape punishment for looting the country's treasury, while the poor are not opportune. The rate at which the

looters are being celebrated and legally protected from proper execution has become a farcical of Nigerian criminal justice system.

## Between the Gatekeepers and Getaway: Anti-graft Agencies and the Conundrum of Legalism

The knowledge of the facts that anti-corruption war in Nigeria fundamentally relies on the substance of the evidence provides in the court and the experience of legal team representing the institution dictates whether the war against corruption could be won or not. It should be noted that *the judge was not there when the offence was allegedly committed and can only rely on the facts produced by the prosecution. So, if that evidence cannot sustain the charge, the judge releases the accused* (Daily Post October 7, 2017). It is on this basis that several top corruption cases have either been won against the institution or dismissed by the jury. The cursory look into the cases of *FRN v JUSTICE ADENIYI ADEMOLA & 2 ORS*, *FRN v MRS. PATIENCE JONATHAN, FRN v MIKE OZEKHOME, FRN V ORUBEBE, and EFCC V HYDIAZIRA NGANJIWA* provides a critical indulgent into the deplorable composition of the EFCC legal contingent.

### FRN v JUSTICE ADENIYI ADEMOLA & 2 ORS

Following the search of the residences of seven judges carried out in October 8 and 9 by the Department of State Security (DSS), the defendants were charged on an 18-count charge. Justice Adeniyi Ademola; his wife, Olabowale; and Mr. Joe Agi (SAN) were arraigned by the Federal Government on charges bordering on criminal conspiracy to receive gratification in various ways, contrary to Section 8(1)(a) of the Independent Corrupt Practices and Other Related Offences Act 2000.The respondents filed *a-no-case* application against the EFCC. The trial judge Jude Okeke of the FCT High Court, Maitama, Abuja, maintained *a-no-case* submission which eventually led to the discharge of the defendants. The case was therefore struck out by the court. The trial judge held that:

> The prosecution did not establish a prima facie case against the defendants. *With respect, the learned trial judge ought not to have considered the merit of the case and the credibility of witnesses in the ruling. Having regard to the facts and circumstances of the case coupled with relevant decided authorities on no case submission I am of the strong view that the government has an arguable appeal. I suggest that the appeal already filed against the ruling of the learned trial judge by the government should be pursued with vigor. My belief in the possibility of the success of the appeal is anchored on the cases of Olawale Ajiboye v The State (1995) 8 NWLR (PT 414) 408 wherein the Supreme Court had this to say: It must be recognized that at the stage of a no case submission, the trial of the case is not yet concluded. At that stage, therefore, the Court should not concern itself with the credibility of witnesses or the weight of their evidence even if they are accomplices. The Court should also at this stage be brief in its ruling at too much might be said which at the end of the case might falter the Court's discretion. The Court should again at this stage make no observation on the facts*. (Sahara Reporter April 12, 2017)

### FRN v MRS. PATIENCE JONATHAN

A sum of $5.9 million was traced to the Skye Bank account of the wife of former President of Nigeria, Patience Jonathan, believing the funds were part of looted funds. The EFCC filed an application to freeze the account of the respondent. However, the respondent lawyer, Mr. Ifedayo Adedipe (SAN), filed a counter application, praying the court would unfreeze his client's account, challenging the EFCC on legal jurisdiction. Justice Olatoregun of the Federal High Court in Lagos upheld the necessity to lift the frozen order placed on the defendant's account. Justice Olatoregun held that:

> she had no option but to discharge the freezing order as the EFCC, despite being served with Patience application, did not file a counter-affidavit to oppose her prayers and all the averments contained in her affidavit. She stated, It is trite in law that an order cannot be made against any person who is not a party before the Court. (The Punch Newspaper, April 7, 2017)

### EFCC V OZEKHOME

On February 7, 2017, the Economic and Financial Crimes Commission (EFCC) filed an interim order to freeze the bank account of

Mr. Ozekhome, a counsel to Governor Ayodele Fayose, the Governor of Ekiti State. The EFCC argued that the N75 million paid into the account of Ozekhome was a proceed from the arms procurement funds looted by Col. Sambo Dasuki (rtd.), the former National Security Adviser [NSA] to former President Goodluck Jonathan which was later traced to Ayo Fayose's account. Ozekhome filed a counter-affidavit against the EFCC to vacate the interim order; in his ruling, the trial judge, Justice Anka J., of the Federal High Court sitting in Lagos held that:

> Though it was not in doubt that the N75m came from Fayose, Ozekhome could not be held liable because there was no restriction on Fayose's account as of the time the N75m was paid to his law firm. Justice Anka noted that the freezing order earlier obtained by the EFCC in respect of Fayose's accounts had been lifted by Justice Taiwo Taiwo of the Federal High Court in Ado-Ekiti. My decision is based on the following considerations: considering the fact that the source of the fund of the respondent/applicant is derivable from an unencumbered account;. . .put into consideration also was the fact that the funds are monies paid for the services rendered by the respondent/applicant in prosecuting various actions before various Courts. . .I find it very doubtful if the objection of the EFCC can be lawfully sustained. (Sahara Reporters, April 03, 2017)

## FRN V ORUBEBE

The defendant was charged as a result of diversion of N1.9 billion from the funds allocated for the construction of the east-west road. The ICPC was prosecuting the case while the Attorney General of the federation *filed a nolle prosequi* questing to withdraw the case by the constitutional power conferred on him under section 174 of the 1999 Nigerian constitution. As a result of the constitutional provision, the case was struck out by the court, while the defendant was discharged.

## EFCC V HYDIAZIRA NGANJIWA

The EFCC arraigned Justice Nganjiwa, a serving judge of the Federal High Court in Bayelsa State, for unlawful gratification of $260,000 and 8.65million Naira which negates the ethic of public office. On June 23, 2017, the EFFC charged the defendant – Justice Nganjiwa – on a 14-count charge before Appellate Court in Lagos State. The defendant lawyer, Chief Robert Clarke (SAN), challenged the court jurisdiction to entertain the matter. The counsel argued that by the virtue of Section 158 of the 1999 constitution which stipulates that only the National Judicial Council had jurisdictional capacity to hear such a matter. The Court of Appeal sitting in Lagos under Justice Adele Obaseki held that:

> Only judicial officers that have been dismissed by the National Judicial Council could be tried or investigated by the commission. (PM News December 12, 2017)

From the above several cases of corruption, it appears that judiciary remains a big challenge to the realization of anti-corruption crusade in Nigeria. With the handling of high-corruption cases, the anti-corruption agencies have been bewildered with the technicalities of law that provides avenue for the looters to escape from the actual punishment. The mechanisms employed include court injunction usually ex parte and subversion of legal, procedural, and constitutional principles. The courts have been criticized regarding the excessive application of these legal tools which serves as safety net for the corrupt political and public figures. Several cases have been lost by the anti-corruption as a result of court injunction that restricts the EFCC and ICPC from apprehension or further prosecution of individuals alleged of corruption. Regarding the prevention of the agencies in performing its statutory functions, the case of James Ibori, the former Governor of Bayelsa State, comes to mind; the court restrained the EFCC from investigating corruption allegation against the former Governor. The ex parte injunction granted by the court was characterized as one of the challenges of legalism faced in fighting corruption by the anti-corruption institutions. The ex parte is considered as legal stratagem employed by Nigerian political elites alleged of corruption to evade punishment. Moreover, the courts are perplexed with the delay tactics adopt by the defendant counsels. In many occasions, some of the alleged corrupt individuals also adopt application for bail in order to frustrate their prosecution. The myriad of challenges facing

Nigerian anti-corruption war is centered on unreformed legal system which creates opportunity often exploited by the corrupt political class to get away with the right punishment.

## Anti-corruption Institutions and the Politics of Uncertainty

Having considered the legality of action against the anti-corruption institution, there are other approaches through which political elites getaway with the public funds. One of the baselines includes the ingenuity of elected representatives. Several regimes have exploited the power of political incumbency to sustain membership loyalty despite the allegation of corruption against their cabinet members as it is applicable to Nigeria's political operation. Although this is not only applicable to Nigeria's political environment, a pictorial explanation from the developed country like the United States provides an expounding paradigm in explaining the politics inherent in anti-corruption movement. The case of Federal Bureau of Investigation [FBI] constitutionally empowered to probe the US-Russia collision in the US presidential election against President Donald Trump which escorted the dismissal of James Comey constitutes a difficult environment for any agency being controlled by the Presidency to perform its functions without bias or political interference. The firing of former Director of FBI – James Comey – was considered as a political mechanism to manipulate and undermine the realism of the investigation carried out by the FBI. Notably, the power to appoint the Director of FBI lies within the constitutional jurisdiction of the US President and therefore has prospect to solicit favorable investigative outcomes from the appointed loyal individual. In similar political phraseology, it is difficult for any agency established by a particular regime to freehandedly operate in a political environment where the power to appoint the Chairman or Director of the institution dwells within the command of the Presidency. Concomitantly, this analogous intricacy has continued to engender low level of conviction of corrupt political office holders in Nigeria. Even though there is no alternative approach to combat corruption without interrogating the political nomenclature that sets up the agency, the nature and the sincerity of the political leadership determines the actualization of anti-corruption campaign in Nigeria. It should be observed that many challenges affecting the realization of anti-corruption agenda are centered on political leadership. Perhaps, in many occasions, the anti-corruption institution could be designed to protect the corrupt political class or to entrench credibility of the state in order to fascinate international aid donors. The structural and legal design of the institution is championed and orchestrated by the political class; therefore, the genuineness and substance of the institution to operate a translucent manner largely depends on the political will of the regime. It is important to note that anti-corruption institution needs a measure of independence, public accountability, and integrity to operate within the political system.

It is observed that many regimes have utilized anti-corruption agencies in intimidating political opponents in Nigeria. The country has witnessed the case of the former Vice President of Nigeria, Alhaji Atiku Abubakar, and other political opponents especially those who objected President Olusegun Obasanjo's third term bid. The political regime of Olusegun Obasanjo co-opted anti-corruption agencies to punish, victimize, persecute, and prosecute political opponents by employing section 137 of Nigerian 1999 constitution which restricts any citizen with corruption allegation from contesting an election.

> The way this instrument worked is that a person that the President perceives as political opponent could be alleged of corruption by the EFCC. Once the accusation is made, fabricated information can be leveled against the political fellow. The strategy was to use section 137 Subsection 1 of Nigeria's constitution to stop his political ambition which stipulates that: A person shall not be qualified for election to the office of President if he has been indicted for embezzlement or fraud by a judicial commission of inquiry. . . (Ojo 2016)

Therefore, the current approach in mitigating corrupt practices in the country makes a mockery of Nigerian state. The agencies have been criticized on the basis of being bias in its anti-corruption war

by protecting the incumbent regime and political loyalist from prosecution while pursuing political enemies of the regime in power.

## Concluding Remarks

Nigeria remains one of the countries of the world that houses the largest number of poor people; this is as a result of culture of corruption that shapes everyday life of its citizens. To make the situation worrisome, the anti-corruption agencies assigned with the responsibility of combating corruption have been moribund with the dearth of prosecutorial proficiency which remains a big obstruction of legalism. The challenge is not far-fetched from inadequate fiscal capacity to acquire experienced legal professionals coupled with unreformed criminal justice system that ensuing beleaguered display of anti-corruption institution in the court of law. Therefore, some of the alleged corrupt individuals utilized these legal technicalities to get away with the looted public resources. Some of the corrupt public officials have pursued numerous legal logicalities such as perpetual injunction and plea bargain to escape the fury of the laws. In addition, the ineffectiveness of the coordinating security agencies – police, SARS, civil defense, and other security apparatchik – draws back the fight against corruption. The recent loggerhead between the officials of EFCC and National Intelligence Agency [NIA] in the course of apprehension of the Director General of National Intelligence Agency [NIA] who was alleged of economic crime by the EFCC acknowledged the lack of concerted efforts within which the Nigerian anti-corruption institutions operate. In order to build effective anti-corruption institution capable of bringing justice to humanity, there is a need to reform the gray areas in Nigerian legal system especially those sections that are often manipulated by defense counsels who allow the looters to abscond commensurate punishment, with the aim of building a viable and independent anti-corruption institution, free of political bias, manipulation, and intimidation. Moreover, some measures of autonomy that safeguard budgetary stability which will provide opportunity for the anti-corruption agencies to hire experienced legal experts is inevitable. The composition of well-trained legal connoisseurs will provide opportunity to gather substantial evidence against the alleged corrupt public officials. Furthermore, the constitutional provision that empowers the President to appoint and remove the Chairman of the anti-corruption agencies should be amended so that the agencies are not subject to the whims and caprices of the political class. Besides, the protection of whistle-blowers; the right to monitor financial inflows and assets, income, and expenditures; and tax compliance by partnering with financial institutions and all security agencies become crucial in winning the war against corruption. Perhaps, if the necessary time is spent in gathering essential evidences with the help of security networks, informants, and financial institutions, it is believed that Nigeria will triumph over its corruptible sociopolitical ecology.

| 5 | Monopolistic | Relating to a person or business that has exclusive possession or control of the supply of or trade in a commodity or service |
| 6 | Restrictive | Imposing restrictions on someone's activities or freedom |
| 7 | Suo Motu powers | **Suo motu** ("on its own motion") describes an act of authority taken without formal prompting from another party. The term is usually applied to actions by a judge taken without a prior motion or request from the parties |
| 8 | Prima facie | Based on the first impression; accepted as correct until proved otherwise |
| 9 | Competitive | Relating to or characterized by competition |
| 10 | Licensing | A business arrangement in which one company gives another company permission to manufacture its product for a specified payment |

## Introduction

"Competition law is all about economics and economic behaviour" (Nariman 2007). Stigler (1987) defined "competition is a rivalry between individuals (or groups or nations), and it arises whenever two or more parties strive for something that all cannot obtain." Listraa (2015) dealt with the different meanings of competition, to systemize the

versions of concepts of competition arranging these in the same unifying framework in the conceptual paper.

The concept of competition on the level of countries as given by Porter (1990, 2008) discusses how to improve the clearly existing competitiveness and Krugman (1994, 1996) believed that the concept is inconsequential.

However, the proposition assumes that competition is to be sustainable. The consumers are generally not aware of anticompetitive practices by the companies. The companies take the advantage of the situation and take the decision with little regard given to consumer reactions.

It can be summarized that competition is a market situation which offers a wide range of choices to consumers at a realistic prices. This also encourages innovation and productivity for the organizations that are participating in the market. Furthermore, to increase the productivity, optimum allocations of resources are being done.

The first three decades after the independence, India planned the economic development, characterized by controls and licensing, hence the competition was subdued. However, with the initiation of the economic liberalization in 1991, the Indian economy started removed the controls and started to open up.

The Monopolistic and Restrictive Trade Practice (MRTP) Act, an outcome of the licensing and controls administration, became obsolete in the post liberalization era. The MRTP act, constituted in 1969, had some shortcomings.

The act failed to define many of the anticompetitive acts, viz., the "unfair trade practices" invited complaints that resembled consumer or contractual disputes. Thus, the Commission spent much of its limited resources responding to claims about the production of defective goods, deficient services, and related claims that did not allege an injury to competition (Bhattacharjea 2012).

The MRTP act was not enough to deal with the competition aspect, as India entered in to a new regime of globalization in early 1990s. The primary objective of the act was to control the economy, not allowing the concentration of the market power to few players and thus barring any monopolistic practices.

However, the Indian companies faced a severe competition from the domestic as well as from the global enterprises, hence creating a need for a new completion law, which would focus more on competition for future investment and growth rather than controlling monopolies. The Antitrust law is an improvement upon the previous one, which promotes a fair competition along with a prevention of abuse in the open market economy. It is more contemporary and resonates with the realities of the international practices. It prevents the unfavorable impact of the competition within India.

The Competition Act primarily seeks to regulate three types of conduct: anticompetitive agreements, abuse of a dominant position and combinations (i.e., mergers, acquisitions, and amalgamations). As per the preamble of the Act, the primary goal is to (i) prevent practices having adverse effect on competition, (ii) promote and sustain competition in markets, and (iii) protect interests of consumers and to ensure freedom of trade (Pingali 2016).

The aim of the Act is to promote the sustainable competition in markets and also protect the interests of consumers to ensure freedom of trade carried on by other participants in markets in India.

It is procedure intensive and is structured in an uncomplicated manner that renders it more flexible and compliance-oriented. The act has been designed to deal with matters relating to the existence and regulation of competition and monopolies (Dubey 2005). The key component of the Act is competition advocacy. The primary intention is to help evolve competition law through review of policy, promotion of competition advocacy, creating awareness, and imparting training about competition issues.

India's antitrust law, The Competition Act, 2002, was fully constituted on March 1, 2009, by replacing the Monopolistic and Restrictive Trade Practices (MRTP) Act of 1969.

The Competition Act, which was amended by the Competition (Amendment) Act 2007, later came into force on 20 May 2009, when the

Government of India notified the provisions related to anticompetitive agreements and abuse of dominant position of the Competition Act. It took three more years for the merger control provisions of the Competition Act to be brought into force in June 2011 (Gandhi et al. 2016).

Some of the salient differences between the MRTP (1969) act and the Anti-Competitive Act (2002) are as follows:

(i) The MRTP act considered Monopolistic, restrictive, and unfair trade practices were considered illegal. However, in the Competition act (2002) Anti-competitive agreements between enterprises and abuse of dominance by enterprises are prohibited but combinations between enterprises are permitted with a regulatory oversight.
(ii) The MRTP act was not involved with the competition advocacy. Whereas, in the competition act, Competition advocacy is a statutory mandate.
(iii) The competition act provides No suo motu powers to the DG. However, in the MRTP act DG (I&R) enjoyed suo motu powers of initiating investigation concurrently with the MRTP Commission.
(iv) The competition act is part of the law and has already been implemented partially. However, in the MRTP act, the International cooperation policy was not part of the law.
(v) The Competition act is more transparent in nature as Non-obstante clause is part of the Law and the Civil Court jurisdictions are barred by law. However, in the MRTP act, No non-obstante clause existed.

Although the Act was enacted in 2002, the Commission got its enforcement powers in 2009, and since then up to 31 March 2017, it has reviewed over 868 antitrust cases. It has issued orders in 654 cases. The merger review provisions kicked in from 2011. The Commission has since then cleared over 490 merger filings out of 506 filed till March 2017 (Sikri 2017).

## The Administration

The Competition Commission of India (CCI) functions as a corporate and an independent unit, possessing the power to enter into contracts and to sue in its name. It is to consist of a chairperson, who is to be assisted by a minimum of two, and a maximum of ten, other members.

The Commission reviews complaints and decides which are worthy of further investigation. Once the Commission decides that a prima facie case exists, the members order the Director General to conduct an enquiry.

The Director General heads the investigative arm of the Commission. After a period of time, the Director General submits a report on the facts and law, including his recommendation for further action.

The parties involved are given an opportunity to respond, after which the Commission can choose to close the matter, order further investigations, or pronounce an order that directs the guilty party to "cease and desist" from their anticompetitive conduct or pay a fine (not exceeding 10% of the average turnover during the preceding 3 years).

The Commission can also levy a higher fine against cartels, taking three times their illegal profits if this number is greater than 10% of their annual turnover (Lund 2012).

It is also entrusted with the power to enquire into unfair agreements or abuse of dominant position or combinations taking place outside India but having adverse effect on competition in India.

CCI is empowered to enter into any Memorandum of Understanding (MoU) or arrangement with any foreign agency of any foreign country with the prior approval of Central Government to deal with cross-border issues.

If a prima facie case exists with respect to anticompetitive agreements and abuse of dominant position, CCI is empowered to direct the Director General to conduct an investigation in the matter.

The primary objective of the act is to monitor any economic activity which can monopolize the

domestic competition. It also aims to protect consumers and small enterprises, and ensures the freedom of trade.

The Director General would submit his/her report with recommendations. If CCI is of the view that there are no merits to the case, the complaint would be dismissed, with costs. However, during the course of enquiry, CCI may grant interim relief by way of temporary injunctions refraining a party from continuing with the anti-competitive agreements or abuse of dominant position.

In case of failure to comply with the directions of CCI and Director General or false representation of facts by parties, penalties ranging from Rs 1 lac (one hundred thousand) to Rs 1 crore (ten million) may be imposed as the case may be (Sikri 2017).

In the nutshell, the commission looks for the following factors while deciding whether any business deal has any adverse effect on competition.

(i) It should not create any barriers to new entrants in the market.
(ii) It should not drive out the existing competitors out of the market.
(iii) There must be improvements in production or distribution of goods or provision of services.
(iv) There should be opportunities for promotion of technical, scientific, and economic development by means of production or distribution of goods or provision of service.
(v) Overall the consumers must be benefitted from the deal.

Any individual person or any state government or any trade association is able to file a complaint with the Commission, because the petitioner has to pay a nominal fee to register the complaint, the commission has to bear the complete financial burden of investigation. All competition offenses are treated as civil offenses. Jail time may only be imposed (by an independent magistrate's court) if an individual refuses to comply with the Commissions orders (Lund 2012).

## Case of Google

In India, there were two cases against Google, handled by CCI. The first case (Case No. 07 of 2012) is between Matrimony.com Limited, the Informant and Google LLC (Opposite Party No. 1), Google India Private Limited (Opposite Party No. 2), and Google Ireland Limited (Opposite Party No. 3).

The second case (Case No. 30 of 2012) is between Consumer Unity and Trust Society (CUTS), the Informant and Google LLC (Opposite Party No. 1), Google India Private Limited (Opposite Party No. 2), and Google Ireland Limited (Opposite Party No. 3).

It was stated by the Informant that Google runs its core business of search and advertising in a discriminatory manner, causing harm to advertisers and indirectly to the consumers. It was alleged that Google is creating an uneven playing field by favoring Google's own services and partners, through manually manipulating its search results to the advantage of its vertical partners, viz., video (YouTube), news (Google News), maps (Google Maps), etc. It has been asserted that in order to promote Google's own vertical search sites, Google started mixing many of its vertical results into its organic search results. Therefore, when a user searches, for example, the name of a song on Google, he receives links to videos of that song from Google Video or YouTube, both of which are properties owned by Google. It was further emphasized out that Google's own sites would appear prominently on the search results page irrespective of whether they are the most popular or relevant sites to the search, and Google will not place results from any other vertical search sites as prominently as Google's own vertical search sites in its list of results. Google's dominance in algorithmic search market leads to its status as an unavoidable trading partner in search advertisement market. It was also stated that the search algorithm used by Google to determine where a website appears on a search results page, the algorithm used to calculate an advertiser's quality score which forms the basis for determining where an advertisement

appears, the history of changes to Google's search and quality score algorithms, the basis for placing Google's vertical properties toward the top of the search results pages and what caused Consim's (Matrimony.com) quality scores to fall, the ad hoc behavior of Google, etc. will only come to light if and when Google is directed to provide this information by the CCI during the course of an investigation.

In the view of the above allegations, it is concluded that Google has abused its dominant position in the relevant market in India thereby contravening the provisions of Section 4 of the Act.

The informant stated that because of its market share, size, resources, reputation, etc., Google enjoys a dominant position in the market for online search and online search advertising worldwide including in India. Google enjoys a position of strength in the relevant market, which enables it to operate independently of competitive forces and to affect its competitors, consumers, and the market in its favor. It was alleged that Google is indulging in abuse of its dominant position in the market for online search through practices leading to search bias, search manipulation, denial of access to competing search engines, refusal to license content to competing search engines and creation of entry barriers, etc.

Based on these allegations, the Commission asked for investigation for both the cases. In 2012, during the investigation, it was found that (i) online advertising is distinct from offline advertising and (ii) online search advertising is distinct from other forms of advertising like display advertising consisting of text, images, graphics and videos, social network advertising, email-based marketing, and advertisements on mobile applications.

Online search advertising is linked to user-initiated search query that reveals user's immediate interest in the subject matter of the query and thus allows very effective means for targeting potential customers. On the other hand, online non-search advertising is more appropriate to improve brand awareness and brand building. It was also found that Online Search and Search Advertising are complementary and do not form a part of the same relevant product market. The market share of Google in Internet search in April 2018 is 90.61% as compared to 3.24% of Bing, 2.09% of Yahoo, 2.04% of Baidu, 0.68% Yandex Ru, and 0.28% of Duck Duck Go (gs.statcounter.com).

This was the case despite the long-standing presence of other competitors like Yahoo! and Microsoft Bing and the entry of new players in the market. In 2016, Google was also ranked first in terms of digital advertising revenue of selected online companies, generating more than double the amount of revenue as second-ranked Facebook. In total, Google's 2016 net revenues amounted to 89.46 billion US dollars, up from 74.54 billion in 2015 (https://www.statista.com).

Other factors like Google's size and resources, economic power, commercial advantages, etc. further reinforced Google's position of dominance. For these reasons, Google has been able to establish itself as a critical platform for all the stakeholders. The competitors have not been able to dent its market position despite long presence and do not pose any significant competitive constraint upon it.

The committee concluded that Google enjoys a position of strength in these markets which enables it to operate independently of competitive forces and to affect its competitors/consumers as well as the relevant markets in its favor. It was also observed that Google also offers specialized search services like Google News, Google Maps, Google Flights, etc. It provides other products and services such as Google Reviews, Google+, and YouTube.

Google was found to be indulging in practices of search bias, and by doing so, it causes harm to its competitors as well as to users. Investigation has revealed that Google blends its own vertical search features in its online search services in Universal Results. Its own specialized search features (Commercial Units, Universal Results, etc.) at prominent ranks or positions on the Search Engine Results Page (SERP).

Top results receive higher user attention and are critical for online visibility. This structure offers abundant opportunities for leveraging and has also raised issues of conflict of interest.

Thus, the users may not receive the most relevant results. This also adversely affects the

competitive landscape in the markets for online general web search and search advertising as well as adjacent markets such as travel, maps, social networking, and e-commerce.

Consequently, users may be devoid of additional choices of results. This shows that competition is hampered in the market-impeding innovation, and thus, harming consumers. Therefore, Google's conduct was found to be anticompetitive in terms of Section 4(2)(a)(i), Section 4(2)(b)(ii), Section 4(2)(c), and Section 4(2)(e) of the Act.

It was thus found that there does not exist a level playing field for third parties competing with Google's House ads to appear in paid results in response to user searches. Such conduct also amounts to imposition of unfair and discriminatory conditions on third-party advertisers using AdWords and was found by the commission to be in violation of Section 4(2)(a)(i) of the Act. Fines are an important means to achieve deterrence, and avoid future harm to competition (and consumers).

Consequently, the Commission imposed a penalty of Rs. 135.86 Crore only (Rupees One Hundred Thirty-Five Crore and Eighty-Six Lakh) upon Google for the infringing antitrust conduct. A penalty on Google at the rate of 5% of their average total revenue generated from India operations from its different business segments for the financial years 2013, 2014, and 2015 as provided by Google vide its submissions dated 18 January 2018 furnishing financial details. Accordingly, the details of the quantum of penalty imposed on Google are given in Table 1.

A detailed analysis (public Version) of the cases can be found online on the website of CCI for comprehensive reading, where the commission has analyzed various indicators like relevant product market, relevant geographic market, etc. to draw the conclusion.

**Antitrust in India, Table 1** The analysis of the financial penalty (in INR crores) imposed on Google

| Turnover for FY 2013 | Turnover for FY 2014 | Turnover for FY 2015 | Average turnover for 3 years | @5% of average turnover |
|---|---|---|---|---|
| 1722.93 | 2680.31 | 3748.57 | 2717.27 | 135.86 |

Source: CCI

## Conclusion

It is an irrefutable fact that Google is a giant in digital business and needs to generate huge revenues to sustain itself. However, being biased toward "organic" (non-advertising) results as opposed to "sponsored" (advertising) results is still a subject of debate.

This existing body of growing literature on Internet search shows that the countries are taking antitrust act seriously. Today's renewed interest in antitrust represents an opportunity to strengthen competition policy in global scenario. Much has been written about the technological, economic, and regulatory aspects of search engines. These writings have led, for example, to extensive policy debates and to discussions of the quality of search results.

Google obtained a partial stay on the ruling from India's company law tribunal, which allowed it to deposit only a small part of the imposed penalty. Google has appealed against the ruling by CCI that found it guilty of "search bias." CCI would also defend its verdict in the National Company Law Appellate Tribunal (NCLAT).

The Commission used its discretion to penalize Google, striking a balance between the need to reduce anticompetitive behavior and the protection of legal aspect in businesses. Despite a fine that is an insignificant amount for Google is important for prosecuting the company on the ground of abusing the market dominance. In India, being an open market economy, some enterprises may resort to anticompetitive practices for short-term gains. These practices can completely nullify the benefits of competition. It is for this reason that, while countries across the globe are increasingly embracing the open market economy, they are also strengthening their economies through the enactment of competition law and setting up competition regulatory authority.

According to the World Trade Organization (WTO) report, developing countries are more vulnerable to anticompetitive practices than the

developed countries. The reasons are "... high 'natural' entry barriers due to inadequate business infrastructure, including distribution channels, and (sometimes) intrusive regulatory regimes; asymmetries of information in both product and credit markets; and a greater proportion of local (non-treadable) markets. Thus it may be particularly important to protect, consumers in developing countries against cartels, monopoly abuses, and the creation of new monopolies through mergers. Bid rigging in public procurement markets (i.e. collusive tendering) is also pervasive in many developing economies, and merits vigorous enforcement initiatives. ..."

This is a crucial case for India, being a developing country, where the consumer welfare is given more importance, unlike the developed countries, where the innovation is preferred over the welfare of the society. Since the matter is subjudice, as the time progress, the final outcome will be known to us; however, it is a land mark case against Google, which enjoys a large user base in India.

# Application of Sanitary and Phytosanitary Trade Measures

Suwastika Naidu
School of Management and Public Administration, Faculty of Business and Economics, The University of the South Pacific, Suva, Fiji

## Synonyms

Trade theories; World Trade Organization

## Brief Definition

The World Trade Organization is an international organization that deals with the rules and guidelines governing international trade.

Sanitary and phytosanitary measures establish the safety rules for plant, health, and human.

## Introduction

All countries that are members of the World Trade Organization (WTO) have to comply with the WTO's agreements and measures on international trade. Fiji is not an exception to this. By becoming

a member of the WTO in 1996, Fiji has to adhere to WTO's requirements on the application of sanitary and phytosanitary measures for the export of products from its national boundaries (Ravuvu et al. 2017). The Pacific Island countries (PICs) are struggling to meet the SPS requirements of the international trading system with the adverse impacts of these visible in fisheries, ginger, dalo, and kava exports. Recent studies conducted by the international agencies in the PICs confirm that the policymakers and practitioners need to strengthen legislative frameworks, enforcement mechanisms, laboratories, and infrastructure to harmonize the region's SPS compliance with the international standards (United Nations ESCAP 2010). The main aim of this essay is to discuss the SPS agreement and its implications to the Pacific Island exporters and how the agriculture exporters can comply with this agreement.

## SPS Agreement and Its Implications for the Pacific Island Exporters

To begin with, the primary objective of the agreement on the application of SPS measures is to outline the basic rules for food safety and plant and animal health requirements (WTO 2020). These measures are applied to protect the natural ecosystem (plants, wildlife, forests, fish, and animals) and human life from disease-causing organisms. This agreement allows countries to set their own standards based on scientific reasoning, which is applied to protect human, animal, and plant health. The specific forms of the sanitary and phytosanitary measures relate to the inspection of products, treatment of products, setting the maximum levels of pesticide residues, and determining the limits for the use of additives in food. These measures not only apply to domestically produced products but also imported products. The sanitary measures apply to human and animal health, while the phytosanitary measures relate to plant health (WTO 2020). There are certain environmental protection measures that may overlap with the SPS agreement (WTO 2020). These measures include (1) avoiding contamination of drinking water, (2) preventing farm soils and fish stock contamination from heavy metals, and (3) protecting the natural biodiversity. Measures that are taken to protect consumer interest do not form part of the SPS agreement (WTO 2020). The SPS agreement outlines clearer and detailed food safety and animal health measures that affect international trade. Governments can easily challenge their trading partner's food safety and animal and plant health requirements based on the grounds of scientific evidence (WTO 2020). Table 1 summarizes the specific focus areas for SPS measures.

Furthermore, the Pacific Island exporters are facing numerous challenges in accessing the Australia and New Zealand market as a result of the implementation of the SPS agreement on January 1, 1995, by the WTO (Department of Foreign Affairs and Trade 2020; Pomfret 2016). The Pacific Island exporters are struggling to meet the international SPS standards on the export of organic foods and fisheries products and provide certification and scientific evidence related to food safety (Department of Foreign Affairs and Trade 2020). Resultantly, this imposes numerous implications for exporting agricultural and fisheries products to the Australia and New Zealand markets. First, the science-based biosecurity requirements for Australia and New Zealand markets are

**Application of Sanitary and Phytosanitary Trade Measures, Table 1** Specific focus areas for SPS measures

| Focus area | Specific measure |
|---|---|
| Food contents | Food contamination |
| | Food additives |
| | Poisonous substances |
| | Pesticides in food |
| Certification | Food certification |
| | Product labels on food safety |
| Processing methods and quarantine | Processing methods that have implications for food safety |
| | Quarantine for plant and animals |
| | Declaring pest- and disease-free areas |
| | Prevention of disease and pests from spreading to another country |
| | Import sanitary requirements |

Source: WTO (2020)

stringent and demanding which requires the exports from the Pacific Islands to Australia and New Zealand market to be competitive, pest-free, reliably packaged, and subject to high-quality certification and preparation process (Department of Foreign Affairs and Trade 2020). Due to lack of laboratories and skilled personnel, it is difficult for the Pacific Island exporters to meet the quality standards desired by the Australia and New Zealand markets (Department of Foreign Affairs and Trade 2020). Second, the export of Kava from Vanuatu and Fiji still faces export restrictions from the New Zealand, Australia, US, and EU markets. The Kava ban had a devastating impact on the economy of Vanuatu as it is one of its chief exports. Before the implementation of the SPS agreement by WTO, Kava trade had enormous trade prospects for Fiji and Vanuatu. However, SPS-related compliance issues have curtailed the export potential of Kava to Australia and New Zealand markets. Figures 1 and 2 show that Fiji and Vanuatu experienced a major decline in the export of kava with the imposition of the EU-led global ban on the imports of kava. Figure 1 shows that the export of kava declined from 503 million vatus in the year 2001 to 232 million vatus in the year 2002.

Figure 2 shows that the export of Kava from Fiji declined from FJ$5 million in the year 2001 to 1.7 million in the year 2002.

According to Tahana (2020), kava is classified as a drug under the Customs Regulations of Australia. Travellers to Australia can only bring 4 kilograms of kava, but this ceased with the COVID-19 restrictions imposed by the Australian government. Currently, Australia is reviewing its import ban of commercial importation of kava into the country (Tahana 2020). Although the SPS

**Application of Sanitary and Phytosanitary Trade Measures, Fig. 1** Export of kava from Vanuatu. (Source: Created by the author (2020) by using information from the Vanuatu National Statistics Office (2018))

**Application of Sanitary and Phytosanitary Trade Measures, Fig. 2** Export of kava from Fiji. (Source: Created by the author (2020) by using information from the Bureau of Statistics Database (2020))

standard compliance remains a challenging task for the Pacific Island exporters, the implementation of these standards has generated numerous learning opportunities for exporters.

Moreover, the Pacific Island agricultural products, such as ornamental foliage, sawn timber, taro, limes, breadfruit, eggplant, papaya, cocoa, beef, zucchini, and copra, have high potential to access the wide Australia and New Zealand market provided the local authorities invest in strengthening the local SPS measures to suit the requirements of these markets (Department of Foreign Affairs and Trade 2020). Initially, when the SPS standards came into full force on January 1, 1995, it was extremely challenging for the exports from the PICs to enter the Australia and New Zealand market. However, the PACER Plus trade agreement and Pacific Horticultural and Agricultural Market Access Program (PHAMA) have relieved some of the major constraints faced by the Pacific Island exporters in accessing the Australia and New Zealand markets (Department of Foreign Affairs and Trade 2020). Specifically, PHAMA and PACER Plus have improved Australian and New Zealand market access for timber, beef, watermelon, cooked breadfruit, taro, and copra (Department of Foreign Affairs and Trade 2020). Table 2 provides specific details on the difficulties faced by the PICs to access Australia, New Zealand, and other international export markets as a result of the implementation of SPS measures related to food safety, certification, and quality. PHAMA played a critical role in maintaining, enhancing, and opening new market opportunities for the Pacific Island exporters.

One of the main advantages of PACER Plus agreement is that it allows special and differential treatment on the implementation of the SPS measures, which includes increasing the time frames for compliance with the SPS measures for the

**Application of Sanitary and Phytosanitary Trade Measures, Table 2** PHAMA'S role in providing PICs market access to international markets

| Product | Issues | PHAMA's role | Impact |
|---|---|---|---|
| Seafood products | Stringent standards to ensure seafood is safe to eat and has been caught legally | Capacity building and benchmarking audits to meet international standards | Illegal, unreported, and unregulated (IUU) fishing yellow card was uplifted in February to provide Solomon Islands market access to the EU markets |
| Kava | Import ban by EU countries and restrictions on the commercial importation of kava by Australia and New Zealand markets | Developed a national quality standard on the production of kava | Increase in kava sales by $800,000 |
| Sawn timber | Australia and New Zealand export markets require timber to be sourced from sustainable and legal sources | Established the Timber Industry Working Group to develop the timber legality assurance guidelines | Protection of market for Solomon Islands timber to Australia and New Zealand market valued at AU$10 million annually |
| Beef | Australia and New Zealand markets require the PICs to demonstrate that the export of beef from PICs is free from mad cow disease, brucellosis, and tuberculosis | Refurbishment of animal health labs<br>Facilitating the country visits by experts from the World Organization for Animal Health | Ensure ongoing market access of the beef products from Vanuatu to Australia and New Zealand markets |
| Coconut | Inspection of copra meal exporting company's facilities by the Australian Department of Agriculture and Water Resources | Provided funding to three companies in Solomon Islands and one company in Samoa | Companies in Samoa received accreditation from Australian Department of Agriculture and Water Resources |
| Taro | Fiji lacked Hazard Analysis And Critical Control Points (HACCP) accreditation to export to Australia and New Zealand markets | Funded a HACCP specialist to train taro exporters | Exporters become HACCP certified |

Source: Australian Aid (2017)

developing countries to expand export opportunities, as well as building capacity for the Pacific Island exporters to implement the requirements of the SPS measures (Department of Foreign Affairs and Trade 2020).

## Ways of Supporting the Pacific Island Exporters to Comply with SPS Standards

Furthermore, with the increase in regional and international trade from the PICs, there has been a rise in the risk of disease prevalence within the Pacific community. It is common for diseases and pests to migrate from one geographic region to another as products are exported from one country to another. The PICs are small developing island market economies with limited capacity and key competencies to implement the International Standards for Phytosanitary Measures (ISPMs). The main objective of the ISPMs is to ensure that agriculture and other commodities that may threaten the sustainability of the natural ecosystem are safely traded from one country to another. Importantly, exporters from the PICs lack capacity and key competencies to implement international phytosanitary requirements by using the Phytosanitary Capacity Evaluation (PCE) Tool of the International Plant Protection Convention (IPPC). Exporters from the PICs can be supported in numerous ways to achieve compliance with the ISPMs. The support to exporters from the PICs can be from the private sector, government organizations, and the nongovernment organizations (NGOs). Figure 3 shows that different stakeholders have different roles to play in supporting the Pacific Island exporters to comply with SPS standards. Capacity building of the Pacific Island exporters is one of the most priority items highlighted in Fig. 3.

Firstly, at a holistic level, the government officials, private sector, and NGOs can collaborate to enhance communication and exchange of ideas among the exporters and importers from Australia and New Zealand and health experts in the region on the international framework for trade in plants and plant products (STDF Secretariat 2012). This communication and exchange of ideas can be facilitated by using workshops and conferences whereby officials from different backgrounds come together to ensure that the key concerns raised in these official meetings are incorporated in the design of bilateral interventions (STDF Secretariat 2012).

**Application of Sanitary and Phytosanitary Trade Measures, Fig. 3** Support to Pacific Island exporters to comply with SPS standards. (Source: Fiji Sun (2020))

Secondly, government policymakers, NGOs, and private sector organizations can closely work with the leaders from the Pacific Island countries to identify legal frameworks that are incompatible with the IPPC, weaknesses in the export facilitation procedures, and National Plant Protection Organization (NPPO) management capacity. Once these issues have been identified, the PICs can work together to address these concerns via the application of the regional collaboration programs. Thirdly, there is an immediate and urgent need to improve the biosecurity services in the PICs. A collaborative action strategy for strengthening biosecurity services in the PICs should be developed to harmonize the biosecurity laws among the PICs. Undeniably, the biosecurity authority's role is to work with international agencies around the world to provide market access opportunities for exports from the PICs, provide new market access protocols, and make changes to the current market access protocols as and when the need arises. Acquiring export market access is a rigorous process whereby the two trading partners develop import health standards by taking into account the disease status of the exporting countries. The biosecurity authority facilitates the compliance process related to SPS standards by submitting the scientifically justified market access submissions to its trading partners. As a competent regulatory authority, its role is to oversee the effective surveillance programs for managing pests related to quarantine concerns (Fiji Sun 2020).

## Conclusion and Recommendations

To conclude, this essay highlighted that the SPS measures are applied to protect the natural ecosystem from pests and diseases as dangerous organisms can easily migrate from one region to another with international trade of agriculture, fisheries, forestry, and poultry products. The PICs lack skilled personnel, equipment, and infrastructure to comply with SPS standards. There are numerous ways how the PICs can deal with the challenges imposed by the SPS standard compliance issues on its exports. Firstly, the PICs can represent their collective voice on the export bans that are not supported by scientific reasoning and methodologies by the importing countries. There are numerous cheaper dispute settlement processes that can be used by the economically disadvantaged small island economies to resolve trade disputes arising from the implementation of the SPS agreement rather than the process stipulated by the WTO. Secondly, the PICs need to strengthen their laboratories and quality testing infrastructure to confirm and verify the scientific evidence presented by the scientists from the developed countries. The ban on kava exported from the PICs to the EU, Australia, and New Zealand markets is a typical case of small island developing countries losing out on the imposition of import ban from developed countries that has not yet been substantiated by scientific reasoning and evidence. Thirdly, the PICs need to undertake a regional approach to strengthening its legal and institutional frameworks on market access and changes to existing market access protocols. In the long term, the PICs need to expand their industrial capacity to enhance its market access to the Australia and New Zealand markets.

# Arbitration and Governance

Mohammad Mamunur Rashid
Eastern University, Dhaka, Bangladesh

## International Commercial Arbitration Governance

### Synonyms

Arbitration; Arbitration agreement; Arbitration clause; International commercial arbitration; Party autonomy; Public policy

### Introduction

International commercial arbitration (hereinafter referred to as ICA), adjunct to court litigation of commercial disputes, is new locus of private authorities of adjudication system. There are queries how much ICA is efficient, functional, and valid (Renner 2014). However, it evolves as transnational private adjudication system due to indiscriminate booming of international market with no state interference. It is more neutral, widely enforceable, and cheaper though the same adjudicative exercise is accomplished in different venues and flat forms. Activities of ICA have constituted a form of global governance unlikely to atomized form of global governance derived from the authority of national laws and courts and emergence of universal organization demoralizing sovereignty, to some extent, of member states. The objectives of this write-up are to find out the overall frameworks and commercial natures of the ICA.

### Definition of Arbitration

Arbitration means any kind of arbitration administered whether or not by permanent arbitral institution (Indian Arbitration and Conciliation Act 1996). It is a process by which the parties consensually submit a dispute to a nongovernmental or private decision-maker (who may be from other than court of competent jurisdiction, Morgan 1997), selected by or for the parties, to render a binding decision resolving a dispute in accordance with neutral, adjudicatory procedures affording each party an opportunity to present its case (Milos Novovic 2015). It primarily functions on civil disputes despite conflicts or differences of the parties may usually be on legal, technical, or commercial issues or a combination of all. Arbitration may be explained in the following manners (Milos Novovic 2015):

| |
|---|
| **Consensual means to resolve disputes** |
| Arbitration is a matter of contract and a party cannot be required to submit to arbitration any dispute which it has not agreed so to submit |
| No arbitration agreement = no arbitration, there are few exceptions |
| **Nongovernmental decision-maker selected by or for the parties** |
| If governmental decision-maker is selected then we have CoF (choice of forum), not an arbitration agreement |
| Arbitrators usually selected by the parties or arbitral institutions on their behalf of the parties |
| **Final and binding decision-award** |
| It does not result in a merely advisory recommendation |
| Arbitral award can be coercively enforced (New York Convention) |
| **Adjudicatory procedure** |
| Impartial procedure allowing each party to present its case |

## International Commercial Arbitration

International commercial arbitration (ICA), alternative method of solving contractual disputes (Moss 2014), is the process of resolving business disputes between or among transnational parties through the use of one or more arbitrators (if the number of the arbitrator is not mentioned in the arbitration agreement, number would be odd, i.e., one or three). It is simply a private and consensual mechanism of settlement of dispute and leads to final and binding determination of the rights and obligations of the parties (UN 2005).

Section 2 (c) read with Section 9 of the Arbitration Act 2001 (This Act has originally been enacted in Bengali.) refers to:

> "International Commercial Arbitration" means an Arbitration relating to disputes arising out of legal "relationships, whether contractual or not, [and it is] considered as commercial under the law in force in Bangladesh and where at least one of the parties is —
> (i) "An individual who is a national of or habitually resident in, any country other than Bangladesh; or
> (ii) A body corporate which is incorporated in any country other than Bangladesh; or
> (iii) A company or an association or a body of individuals whose central management and control is exercised in any country other than Bangladesh, or
> (iv) The Government of a foreign country;

The status of the people of managerial level of any company and shares of the company are very important to decide whether central management of any company is exercised in Bangladesh or any country other than Bangladesh. There are serious debates in our country when central management and control is said to be in any country other than Bangladesh. In Reckitt Benckiser (Bangladesh) Ltd vs. Oram Limited, majority shareholders and shares are from UK (Reckitbnkisar (Bangladesh) Ltd Vs Oram Limited 2008). As the company has been running its business in Bangladesh, the court did not accept the central management and control which is in a country other than Bangladesh. In Siemens Bangladesh Limited vs. RZ Power Limited, the approach of the court was different.

### Meaning of International Arbitration

Arbitration may be national or international (though every arbitration is considered as national arbitration). In practice it is usual to distinguish between national and international arbitration.

An arbitration is international if:

(a) The parties to an arbitration agreement have, at the time of the conclusion of that agreement, their places of business in different states
(b) One of the following places is situated outside the state in which the parties have their places of business:
  (i) The place of arbitration if determined in, or pursuant to, the arbitration agreement.
  (ii) Any place where a substantial part of the obligations of the commercial relationship is to be performed or the place with which the subject matter of the dispute is most closely connected; or (c) the parties have expressly agreed that the subject matter of the arbitration agreement relates to more than one country (UNCITRAL Model Law).

As per definition of the Act of 2001, three issues are significant to make any arbitration international, i.e., (a) any of the parties is foreign national, or (b) any of the parties is a corporation incorporated in a country other than Bangladesh; or (c) central management and control of the corporation from any country other than Bangladesh (Arbitration Act 2001 of Bangladesh).

An arbitration is international if we have two companies from country A, arbitrating a dispute in country B, under the law of C. If the dispute arose out of the contract to build a spaceship in the country D, a non-Model Law country, it may be an example of the international arbitration.

### Meaning of an Arbitration Commercial

A form of arbitration which is designed for us within commercial relationship and not personal, i.e., family law or labor law relationships, is commercial arbitration. The term "commercial" refers to transactions entered into between parties in the course of their business activities. This leaves consumer contracts outside of the scope of the subject, as well as other aspects of private law, such as family or inheritance law (Milos Novovic 2015).

"In practice the commercial reservation generally has not caused problems as the courts tend to interpret the coverage of 'commercial' broadly" (Diag Human Albert Jan van Berg). However, the term commercial should be given a wide interpretation so as to cover matters arising from all relationships of commercial nature, whether contractual or not. Relationships of a commercial nature include but are not limited to the following transactions: any trade transaction for the supply or exchange of goods or services, distribution agreement, commercial representation or agency, factoring, leasing, construction of works, consulting, engineering, licensing, investment, financing, banking, insurance, exploitation agreement or concession, joint venture and other forms of industrial or business cooperation, and carriage of goods or passengers by air, sea, rail, or road (Article 1(1) of the UNCITRAL).

Commercial legal relationship means a "transaction, contract or agreement described in section 2 of the FAA what is either a maritime transaction or a contract involving commerce" and then noted that Part 1 of the FAA (Federal Arbitration Act 1926) defines "commerce" as means commerce among the several states [of the USA] or with foreign nations, or in any territory of the USA or in the District of Columbia, or between any such territory and any state or foreign nation, or between the District of Columbia and any state or territory of foreign nation (Diag Human 2014).

## Principles of Governing Arbitration

There are few fundamental principles to constitute international commercial arbitration (ICA). These may be:

### Arbitration Agreement

Arbitration agreement is an agreement which provides that, if a dispute arises, it will be resolved by arbitration. Agreement contains an arbitration clause. On the other hand, arbitration agreement may also be agreement when agreement is signed after a dispute has arisen agreeing that the dispute should be resolved by arbitration. The former is mostly practicing type of arbitration agreement. For example, in certain Commonwealth countries (not including England and Wales), it is possible to provide that each party should bear their own costs in a conventional arbitration clause but not in a submission agreement. Article 7(1) of the Model Law states:

> Arbitration agreement is an agreement by the parties to submit a arbitration all or certain disputes which have arisen or which may arise between them in respect of a defined legal relationship, whether contractual or not. An arbitration agreement may be in the form of an arbitration clause in a contract or in the form of a separate agreement.

Arbitration agreement should be in writing (Jugal Kishore Rameshwardas vs. Mrs. Goolbai Hormusji, [1955] 2 SCR 857). In Smt. Rukmanibai Gupta vs. The Collector, Jabalpur and Ors., AIR 1981 SC 479 the court held that:

> an arbitration clause is not required to be stated in any particular form. If the intention . . . to arbitration can be clearly ascertained from the terms of the agreement,. . . also not necessary that agreement to arbitration should appear in the document containing the other terms of agreement between the parties. Law is well settled that arbitration clause may be incorporated by reference to a specific document which is in existence and whose terms are easily ascertainable. . . It should also be noted that the arbitration clause is quite distinct from the other clauses of the contract. . . arbitration agreement embodies an agreement between the parties that in case of a dispute, such dispute shall be settled by arbitrator, or umpire of their own constitution or by an arbitrator to be appointed by the Court in an appropriate case.

In M Dayanand Reddy versus AP Industrial Infrastructure Corporation Limited and others (1993) 3 SCC 137, the court provides that "in the absence of clear intention of both the parties, agreement for arbitration cannot and should not be inferred more so when the specific case of the respondents is that by mistake the clause relating to arbitration crept." The decision of the arbitration is final. However, if the award of the arbitration has been achieved with the exercise of fraud, or manifest or evident material mistake, court may vacate the award.

### Institutional Arbitration and Ad Hoc Arbitration

Institutional arbitration is arbitration which would be conducted through any institutional arbitration

rules. After the submission before the institution, the arbitral institution would decide the procedural and substantive issues. Even the party autonomy is also very limitedly used in the institutional arbitration. Each institution has its own set of rules which provide a framework for the arbitration and its own form of administration to assist in the process. Few institutions are common, i.e., the London Court of International Arbitration (LCIA), the International Chamber of Commerce (ICC), the Dubai International Financial Centre (DIFC), and the Dubai International Arbitration Centre (DIAC). Besides these, there are approximately 1200 institutions worldwide and they offer arbitration services. Some of the institutions deal with a particular trade or industry. Care should be taken in the selection process as some institutions may act under rules which are not adequately drafted and would not be capable to provide fundamental resolution to the parties.

There are some advantages of the institutional arbitration. These may be the availability of preestablished rules and procedures which ensure the arbitration proceedings begin in a timely manner administrative assistance from the institution, which will provide a secretariat or court of arbitration, a prepared list of qualified arbitrators to choose from, an assistance in encouraging reluctant parties to proceed with arbitration, and an established format with a proven record.

Institutional arbitration has few disadvantages as well. These may be administrative fees for services and use of the facilities. Sometimes, administrative fees are more than the amount in dispute. Bureaucratic complexities of the institution may lead the delays of resolution. The time for the parties to respond is serious disadvantage for the parties if the time is unrealistic.

Ad hoc arbitration is arbitration when the arbitration law in force in the place of arbitration would govern the arbitration. It is not administered by an institution such as the ICC, LCIA, DIAC, or DIFC. The parties will therefore have to determine all aspects of the arbitration themselves, for example, the number of arbitrators, appointing those arbitrators, the applicable law, and the procedure for conducting the arbitration.

Ad hoc arbitration has the potential to be more flexible, faster, and cheaper than institutional arbitration. The absence of administrative fees alone provides an excellent incentive to use the ad hoc procedure.

In ad hoc arbitration, arbitration agreement may be reached before or after the dispute has arisen (Arbitration Act 1996). If the agreement states simply, "dispute between parties will be arbitrated." It is preferable at least to specify the place or "seat" of the arbitration.

The party autonomy can be exercised significantly in ad hoc arbitration. The parties should decide substantive and procedural law to govern the arbitration and enforceability of the award. If the parties can't agree in detail, all unresolved issues and implementation of the arbitration would be determined by law of the seat. Ad hoc arbitration would not work if the seat of the arbitration has an established arbitration law.

A properly structured ad hoc arbitration is more cost-effective and flexible, enabling the parties to decide the resolution procedures themselves and better suited for the parties. It places a heavier burden on the arbitrator to organize and administer the arbitration. Here the parties to be very much cooperative, affording, implant the expertise to determine the rules. A distinct disadvantage of the ad hoc process is that its effectiveness is dependent on how willing the parties are to agree on the arbitration procedures at a time when there may already be a dispute. The failure of one or both parties to fully cooperate can result in time spent resolving issues or an ultimate recourse to court.

### *Lex Arbitri*

International commercial arbitration mostly takes place in a country that is neutral in the sense that none of the parties to the arbitration has a place of business or residence in the place of arbitration. In *Paul Smith Ltd vs. H & S International Holding Incorporation*, *lex arbitri* was described "as a body of rules which sets a standard external to the arbitration agreement, and the wishes of the parties, for the management of the arbitration." Functions of the *lex arbitri* may be:

(i) ***Internal Lex Arbitri***:

*Lex arbitri* governs the constitution of the arbitration tribunal; the appointment and challenge of the tribunal; the maintenance of the standards of independence and impartiality; the constitution of the arbitration proceedings; the allocation of roles between parties and arbitrator, procedural rights, powers and obligations, formalities, timings and methods of presentation of the case, place of hearing, service of process, rebuttal rights of each party, close of hearings, and admission and probative value of evidence; and the form of the final award (Mistelis, L).

(ii) ***External Lex Arbitri***:

*Lex arbitri* governs the extent of judicial assistance, supervision, or control over the arbitration proceedings, support of the arbitration proceedings, and relevance of local or international mandatory rules and public policy (Mistelis, L).

### Selection of Arbitrators

In choosing the appointment of the arbitrators, two points should be taken into account. These may be:

(i) In choosing an arbitrator to be nominated by a client, advocate should find out the tendency of the arbitrator's minimum appearance of bias (Smit and Pechota 1997).

(ii) If you [any one] shoot at the King, you [he/she] must kill him.

Besides above points, the parties should conduct research about the potential arbitrators. If the institution provides any list of the arbitrators, read the biographies of each arbitrator to find out the individual's primary occupation and obtain a general sense of his or her background. The consultation with colleagues and staffs of other companies may also be taken into consideration. The reasoning and justification of the award previously provided by the concerned arbitrators are to be scrutinized. In appointing an advocate as the chair of the arbitration, his controlling and ruling capacity should also be taken into consideration.

### Language

The language or languages of the arbitration can be agreed upon by the parties. Party autonomy is particularly important here since the choice of the language affects the parties' position in the proceedings, the expediency and costs of the arbitration. If the parties have reached an agreement on the language to be used in the arbitration, due to the principle of the priority of party autonomy, the tribunal has to accept the determination by the parties unless such language avails unfair advantage to anyone's party (Binder 2005, 201). Since the arbitral tribunal has no lex fori, the parties are not bound by mandatory provisions in force at the seat of the arbitration which provide that proceedings before domestic courts must be conducted in the language of that country.

Article 17(1) UNCITRAL Arbitration Rules provides that the arbitral tribunal shall determine the language of the arbitration "promptly after its appointment." This rule should generally be followed in international arbitration, even if, as in our case, the proceedings are not conducted under the UNCITRAL Arbitration Rules. The tribunal is not completely free in determining the language. There are both practical and legal issues which the tribunal has to take into account in making its decision.

Firstly, the arbitrators have to take into account the language of contract documents, the correspondence between the parties, the parties' own language capabilities, and the costs involved in extensive translations of oral proceedings and written submissions. For example, the London Court of International Arbitration rules (Article 17) and the American Arbitration Association rules (Article 14) presume that the contract's language shall be used as the language of the arbitration.

Secondly, the arbitrators have to be aware that the factual background of the case and the relevant legal arguments are to be presented to the tribunal which affect the position of the parties in the arbitration. The International Chamber of Commerce (ICC) rules (Article 16) stipulate that the arbitral tribunal shall consider "all relevant circumstances, including the law of the contract."

### Separability of the Arbitration Agreement

Arbitration agreement is treated separately from the underlying contract. Validity of the contract does not affect the validity of the agreement. According to the separability principle, the invalidity of the underlying agreement will not have an impact on the arbitration clause; likewise, the invalidity of the arbitration clause will not render the underlying agreement invalid.

### Arbitration Clause

An arbitration clause is a content of the arbitration agreement. It requires the parties to resolve their disputes through an arbitration process. It may be two types, i.e., formal and informal. Formal clauses contain the provisions for the parties to decide by what manner they would resolve their dispute (American Express Card Member Agreement). In case of informal arbitration clause, keeping with the informality of the arbitration process, the law is generally keen to uphold the validity of arbitration clauses even when they lack the normal formal language associated with legal contracts. Each arbitral institution has its own arbitration clause.

## Legal Frameworks

Several national and international legislations have been functioning on international commercial arbitration (ICA). National laws have been enacted on the basis of the UNCITRAL Model Law. Despite law is national, its approaches are very much likely to the law relating to arbitration irrespective of national and international law maker's approach. However, we may take the help of the diagram of the following table to understand the legal frameworks of the international commercial arbitration (ICA).

| **Arbitration agreement** |
|---|
| Contractual, conditio sine qua non |
| **Institutional rules** |
| Contractual, extension of the agreement between the parties |
| **National legislation** |
| Legislation, typically only few mandatory rules that the parties cannot deviate from; a lot of national laws are modeled on UNCITRAL Model Law |
| International conventions |
| Legislative, New York convention is the most important instrument, regulated recognition and enforcement of foreign awards |

(continued)

### Party Autonomy and Principles of Public Policy

"Literally, autonomy means 'total independence of the parties' in 'organizing' but not 'conducting'an arbitration." Party autonomy should not be exercised where it is an institutional arbitration; the procedural framework is already tailor-made by the arbitration institution and not by the parties, whereas in ad hoc arbitration the procedural framework made by the parties governs the arbitration. Autonomy could be said to exist "when an individual has the capacity to make a choice among real alternatives and can make the choice for reasons with which he or she is comfortable" (Matz 1994).

Public policy or *ordre public* is a sociological concept. It is made and enforced by members of the society. It comprises of different types of cultures, social and moral values. It is very dynamic in nature as it changes with time and place. Though party autonomy is an important guiding principle in international arbitration, it cannot be protected by law if contrary to public policy, morality, natural justice, public interest, and existing law (Pryles 2016; Egbedi Tempara 2016; Fagbemi 2015).

## Challenges for Local and International Commercial Arbitration

International commercial arbitration has achieved enormous popularity due to its proper and timely initiatives in different issues ranging from legal to commercial specters. The people of any area having special qualification can exercise his/her prudence in ICA unlikely to any other traditional adjudication system. This popular but not traditional adjudication system has to encounter few challenges in practice.

### Selection of the Arbitrator

In case of ad hoc arbitration, parties should have to select the arbitrator. As the parties or stakeholders of the dispute are from different countries, it is a great challenge for the parties to come to an agreement on the following issues, i.e., Who would be the arbitrator? What procedures should be followed in adjudication? How the arbitral award would be enforced? Even the ideological or regional or business interest is considered by the parties to decide who would be their arbitrators. After the appointment of the arbitrator, the elations of the arbitrator and party appointing are contractual. As a result, arbitrator is passive in dissenting with the interest of his appointing party.

### Selection of the Arbitration Institutions

More than 1200 arbitral institutions worldwide have been functioning to provide the institutional arbitration. Party has the chance of choosing their appropriate arbitral institution. The problem is that every institution is not capable to provide every type of resolution. If the party has no knowledge in this regard which institution is appropriate for their dispute, they would be in trouble. Hence, the parties should accommodate the arbitration agreement consulting with the expert.

### Expenses

Arbitration is speedily and timely for the parties. The parties would be in trouble if the arbitration is not accomplished with reasonable expenses. Sometimes the arbitrators are specialist on the issue and they charge so big amount that the parties are discourage to go for arbitration. On the other hand, if the arbitration is institutional, the parties have no chance to avoid the expenses fixed by the concerned institution.

### Timing of the Arbitrators and Institutions

If the arbitration is institutional, institutions would fix the time. Sometimes, timing of the institutions would be awkward for the parties, whereas ad hoc arbitration avails the parties to appoint the parties and determine many significant issues of the arbitration. Practically those appointed arbitrators work so arbitrarily that they take enormous time to resolve the issue. Two arbitrators are willing to sit for one day; another one is ill. So it is not possible for that day. The next day, one arbitrator is in *omrah*; the remaining two arbitrators are ready for sitting. Basically there is no institution to oblige the arbitrator to sit immediately.

### Enormous Laws

In arbitration, parties and arbitrators are simultaneously at liberty to determine what should be governing law. No law is fixed by the specific locality. Party can choose the seat of arbitration. Then arbitrators would determine what would govern their arbitration. Thus, party should also consult with legal experts what law and seat of arbitration would more suit their dispute.

## Conclusion

International commercial arbitration is appropriate and timely innovation in the field of resolution unlikely to the traditional approaches. It opened the gate for the business entrepreneurs to sustain a sound environment to boost up the national economy with their profitable business. Business groups do not, now, need to walk here and there and wait for a long time to get resolution of any issue.

In comparison with the commercial characteristics, international commercial arbitration is more flexible, less time-consuming, and cost-effective. It tries to see the business interest. People from business expertise and stake may be appointed as arbitrator.

No national law is obligatory for the parties or arbitrator except the law of the seat. Law and arbitrators are transnational. There is no territorial boundary for the arbitration. Even if the arbitration is institutional, the seat of the arbitration may be placed another even if the law will be applied according to the arbitration agreement. Hence, international commercial arbitration (ICA) may be an example of the global governance unlikely to the endeavor of the international organization attempted in 1944. Attempt of 1944 was tried curtailing the strict sovereignty, whereas the ICA attempt has been done to pacify and smoothen the world business system.

## Synonyms

Adjudication; Adjustment; Agreement; Compromise; Decision; Determination; Judgment

## Definition

Arbitration is a form of alternative dispute resolution (ADR) in which parties choose to have a dispute or disputes decided by the third party (an arbitrator) and agree to be bound by the arbitrator's decision. That decision is legally binding on both sides and enforceable by the courts.

## Introduction

Globalization has both benefits and drawbacks, including an increase in the number of commerce and labor disputes. These disputes can lead to lengthy court battles, which can cost companies and governments huge amounts of money, time, and energy. In an effort to avoid these costs, countries have turned to alternative dispute resolution (ADR). Alternative dispute resolution refers to various processes that help parties to resolve disputes without going to trial. Alternative dispute resolution includes negotiation, collaborative law, mediation, and arbitration.

Mediation and arbitration are similar, but they differ in several important ways. In mediation, a third party (the mediator) assists the parties in negotiating a settlement. Arbitration also involves parties referring their dispute to a third party (the arbitrator or arbitration tribunal), with the parties usually agreeing to be bound by the decision made by the arbitrator. The decision is called an award; it is analogous to a judgment in a court of law. Arbitration is similar to court proceedings in that there can be testimony and evidence given. Arbitration is often faster and therefore more cost-effective. Arbitration also allows both parties to precisely define the boundaries of their confidentiality. Arbitration has a long history and is becoming more widely used with modern businesses and governments.

International arbitration has been increasing popular as a method to resolve disputes, usually regarding commerce. The main areas of conflicts in commerce are energy and natural resources. International arbitration is particularly useful because a country can take an international arbitral award and enforce it in the 160 countries that have signed up to the Convention on the Recognition and Enforcement of Foreign Arbitral Awards (more commonly known as the New York Convention). The decisions are binding not just in the debtors' country, but everywhere the debtor has assets (Kinder 2015). Overall, arbitration makes international trade easier to conduct.

There are centers for arbitration all over the world. London is considered to be the main center for arbitration, as it houses the London Court of International Arbitration (LCIA). In recent years there has been a shift in where the international arbitration centers are located, from heavy concentration in the West to more centers in the Middle East and the Far East. To be a regional arbitration center, a potential site needs good hotels, flight connections, and a stable court system (Kinder 2015). It is important to have multiple centers for arbitration resolution, in order to secure buy-in from countries. Countries want to feel like the place of the hearing is neutral or even "home court" in order for them to participate in arbitration.

In the public sector, governments have been looking to arbitration to avert or resolve labor unrest, especially strikes. Governments provide essential services and strikes can have major consequences. Many public employees do not even have the right to withhold their services, such as the police and firefighters. Adequately addressing labor concerns while balancing public safety can be difficult, but such arbitration has been successful in many instances.

There are some potential disadvantages to governments using arbitration to settle their disputes. Some argue that arbitration constitutes an illegal delegation of authority, that arbitration distorts settlements and redistributes resources in favor of unions, and that arbitration destroys (or at least "chills") free collective bargaining (Kearney and Mareschal 2014). Also potentially troubling is that there is no link between the arbitrator and the electorate. When politicians are making a decision they can be held accountable by the voting public, but the same is not true for an arbitrator. Despite the potential disadvantages, use of arbitration continues to grow.

## Types of Arbitration

In its simplest form, arbitration involves two parties agreeing to let an arbitrator hear their complaints and accept whatever legally binding decision the arbitrator makes. Although the definition might be simple, there can be many variations on arbitration. Some variations deal with how an arbitrator is allowed to make a decision (conventional and final offer). Conventional arbitration is where an arbitrator makes an unconstrained decision, and final offer arbitration in where the arbitrator must choose between the parties' final offer. In addition, there are other types of arbitration: grievance, interest, night baseball, and high-low. There are even hybrids, like mediation-arbitration and arbitration-mediation.

Grievance arbitration (sometimes called rights arbitration) is when there is a dispute between the parties of a collective bargaining agreement over interpretation, administration, application, or alleged violation of the terms and conditions of a collective agreement while it is still being enforced. It is often the final step taken in order to avoid a strike. An arbitrator hears evidence from both the union and the management and interprets terms in an existing contract. The arbitrator then determines whether one party to the agreement has violated the agreement, making a ruling accordingly. Grievance arbitration is often criticized on the grounds that it is an illegal delegation of authority and that there are other groups that should make determinations about collective bargaining agreements (such as state and local grievance commissions or state labor agencies). Despite the criticisms, grievance arbitration has achieved almost universal acceptance in unionized areas in the private sector and is used in many governmental settings as well (Kearney and Mareschal 2014).

Interest arbitration (also called contract arbitration) involves an arbitrator deciding what will be included in the parties' collective bargaining agreement when the parties cannot come to an agreement while negotiating. This differs from grievance arbitration, in which an arbitrator decides if there is a violation in an existing agreement. The arbitrator conducts a formal hearing in which both parties present their sides. Upon review of the testimony and evidence, the arbitrator will decide what language should be in the contract. Over half of the states have some form of interest arbitration procedure for at least one group of public employees (Gaylord 2010).

Final offer arbitration requires the arbitrator to adopt the final offer of one of the parties in its entirety, presumably the most reasonable proposal overall. The benefit to this approach is that the arbitrator must use one of the party's agreements, taking the drafting of the agreement out of the arbitrator's hands (since the arbitrator is not an elected official). The downside to this approach is that if both proposals are unreasonable the final decision will not be satisfactory. Final offer arbitration does help solve the chilling effect issue that is a criticism of more traditional arbitration. The thought that either party may lose everything in arbitration could serve as a strong incentive for the parties to seek security in their own negotiations. Final offer arbitration also has several variations: issue-by-issue, night baseball, and high-low.

A way to lessen the likelihood of a poor decision being chosen is to use issue-by-issue arbitration. This allows the arbitrator the freedom to find in favor of one party on some of the issues and for the other party on the remaining issues. Ruling issue-by-issue can be more time consuming because it might encourage parties to keep all issues open for discussion, but it does allow the arbitrator to reject the most unreasonable terms in both proposals (Gaylord 2010).

Another variation on final offer arbitration is night baseball arbitration. In this case, both parties make offers that the arbitrator does not see. The arbitrator then goes through the proceedings, listening to testimony and evidence, and makes an award. The parties go back to the original offers and have to use the offer that most closely matches the arbitrator's award. This also keeps the final agreement out of the hands of the arbitrator and in the hands of the parties.

In high-low arbitration (also known as bracketed arbitration), the parties agree before the proceedings to the high and low parameters for the award. The arbitrator, who does not know the

parameters in advance, goes through the regular proceedings and makes an award. If the arbitrator's award is between the high and low figures, the award stands as is. If the award is lower than the low bracket, the low figure is used, and if the award is higher than the high bracket, the high figure is used (Kearney and Mareschal 2014).

The two hybrid approaches, mediation-arbitration and arbitration-mediation, have both had some success. In mediation-arbitration the third party functions as both the mediator and the arbitrator. The first part for parties to do is to negotiate. If the parties are unable to come to an agreement in a reasonable period of time, the proceedings become arbitration, during which the third party can make a ruling. The benefit to this approach is that the third party will have in depth knowledge of the case before the arbitration even begins. Arbitration-mediation works in the reverse order. First arbitration is performed, after which a decision is made but is not communicated to the parties. Mediation then commences, with the hope of a voluntary settlement. If no agreement is made, the arbitration award stands. The benefit to this process is that it often leads to the parties settling (Kearney and Mareschal 2014).

## Arbitration Around the World

A major moment for international arbitration came in 1958 when the New York Convention was adopted by a United Nations diplomatic conference. Under the terms of the Convention, each country undertakes to recognize arbitral awards as binding and to enforce them in accordance with the rules of procedure of the territory where the award is to be recognized (Bedrosyan 2015). The rules for arbitration can come from the agreement, or from special rules drafted for a particular case, or from the law of the country in which the arbitration proceedings will take place. In order to enforce an award, a party needs to produce a certified copy of the award and the agreement to arbitration to the country where the enforcement is being sought. The New York Convention is not the only agreement about cross-border enforcement of arbitration awards, but it is the most important. Approximately 160 countries have signed the agreement, thus far making its global reach impressive.

Countries that use arbitration have different rules for the process. Below is a look at how arbitration is applied in four large countries on four different continents: China, Egypt, Brazil, and the United States.

Over the past four decades, China has been engaging in reforms in order to open itself to the world. Unsurprisingly, being open to the world meant an increase in conflicts between individuals and companies. Like many other countries, China turned to negotiation, mediation, and arbitration as alternative methods of dispute resolution instead of litigation. In order to deal with the new reality, China passed the Arbitration Law in 1994 (Xu 2012).

In China, arbitration generally refers to civil and commercial arbitration used for resolving disputes related to contractual matters and property rights between individuals and organizations. It excludes disputes involving marriage, adoption, guardianship, maintenance, succession, and administrative disputes that are handled by the relevant administration authorities. China's definition of arbitration is very similar to the definition used in Western societies. Arbitration refers to a dispute resolution system in which the disputing parties voluntarily agree to bring the dispute to nonjudicial third party who will impartially judge the dispute and issue an arbitration award with a binding effect on the parties (Xu 2012). The arbitration system in China consists of domestic arbitration and international arbitration. Domestic arbitration is used to settle domestic civil and commercial disputes between local citizens. International arbitration refers to civil and commercial arbitration involving foreign matters or matters with an international perspective.

Another country that has a fairly new arbitration law is Egypt. Egypt turned to arbitration after it found its judicial system overloaded with investment disputes, causing long delays in judgments. This led to Law No. 27 of 1994 on Arbitration in Civil and Commercial Matters. The law

specifies that an arbitral tribunal must be composed of an odd number of arbitrators (typically three). Each party appoints an arbitrator, and then both parties jointly agree on the third arbitrator. An arbitrator does not have to hold a law degree or any specific academic qualifications and can be of any nationality or gender (Taha 2015). An arbitrator cannot be a minor, under guardianship, or deprived of his/her civil rights by reason of a judgment against him/her for a felony or misdemeanor due to dishonesty or a declaration of bankruptcy, unless their civil status has been restored. Arbitral proceedings typically commence on the date the respondent receives the request for arbitration from the claimant. The arbitral tribunal must render its final award within the period agreed upon by the two parties and, if no period can be agreed upon, then within 12 months of the date of commencement of the arbitral proceedings. In Egypt the award is final. The dispute may not be reviewed by or re-litigated before state courts, but could possibly be voided if it does not meet certain conditions.

Arbitration in Egypt also covers government contracts. An arbitration clause in a government contract concluded between a government agency and a private person is effective only upon the approval of the concerned minister or the head of the contracting agency where the agency is not subject to a specific minister (Taha 2015). There have been complications using arbitration in regard to government contracts due to the new 2014 Constitution in Egypt. The 2014 Constitution "requires the submission of any administrative dispute to the exclusive jurisdiction of the State Council." By submitting disputes to the State Council, it is reasonable to have doubts about the fairness of this process.

In Brazil the right to arbitration is set out in Law No. 9.307 (1996), which has been updated many times in the past two decades. Parties may bring their disputes to an arbitral tribunal either by agreement or because of an arbitration clause in a contact. An arbitrator can be any legally capable individual who is trusted by the parties. There can be more than one arbitrator but it must always be an odd number. The award is supposed to be made within the time limit specified by the parties. If there is no stipulation, then the award will be made within 6 months from the date of the commencement of arbitral proceedings or from the date of the substitution of an arbitrator. A decision will be made in writing, which will have the same effect as a judgment issued by a state court. The law also addresses recognition and enforcement of foreign arbitral awards. In 2015 Brazil amended the law to allow companies owned by the state and/or government agencies to be bound to arbitration agreements, allowing them to settle disputes related to disposable property rights in which they might be involved (Dimitroff and Mattioda 2015).

There is a long history of arbitration in the United States. The United States Congress passed the Arbitration Act of 1888, which laid out the federal government's role in railroad labor conflicts. The act was the first federal law enacted in the United States to set up arbitration procedures in critical industries. Although railways were privately owned, the US government was deeply concerned with keeping them running; railroads were a major form of transportation for the United States. In the end the Arbitration Act of 1888 was a failure. It was eventually replaced by the more successful Erdman Act of 1898 and the Newlands Act of 1913.

Arbitration made a giant leap forward in 1925 when the United States enacted the Federal Arbitration Act (FAA). The law was the first federal act in the United States to formalize arbitration through an act of Congress. The act provided for contractually based mandatory and binding arbitration, which results in arbitration award made by an arbitrator. The parties must agree to arbitrate versus going to court, and they must give up the right to appeal on substantive grounds to a court. Any award made must also be confirmed by a court of law. Confirming the award reduces it to an enforceable judgment, which can be enforced by the winning party in court. The act requires that the award be confirmed within 1 year; any objection to the award must be challenged within 3 months.

There have been challenges to the Federal Arbitration Act, but the Supreme Court has always upheld it. In *Southland Corp. v. Keating*,

465 U.S. 1 (1984), the US Supreme Court ruled that the Federal Arbitration Act applied to contracts under state law (MacNeil 1992). The case involved several franchisees of 7-Eleven being sued by the owner of 7-Eleven. The owner of 7-Eleven wanted to uphold the original contract that requires arbitration in case of a dispute. Although dissenting justices argued that the Federal Arbitration Act only applied to federal contracts, the majority felt otherwise. After this decision, the act became much broader reaching.

Despite the 1925 Federal Arbitration Act, arbitration was not quickly utilized by the public sector. That changed in 1970 when federal postal workers engaged in a 2-week-long strike over low wages, stopping mail service around the country. President Nixon ordered the Army to deliver the mail; postal unions asked the government to intervene the negotiations. Those negotiations culminated in the Postal Reorganization Act of 1970, which transformed the US Post Office Department into the more corporate-like US Postal Services. American postal workers gained collective bargaining rights, including arbitration, but lost the right to strike.

Impasse procedures for state and local government are handled differently in regard to public sector workers based on the laws of their respective locations. As of 2012, at least 36 states provide for mediation, at least 28 states provide for fact finding, and at least 27 states provide for arbitration (Kearney and Mareschal 2014). Some provisions call for conventional arbitration while others final offer arbitration or both methods.

## Conclusion

Labor unrest, especially in areas with essential services, is not beneficial for any country. Finding ways to settle disputes before they lead to strikes and other unrest is in everyone's interest. There are a variety of ways arbitration can be applied, and it is up to the governments of countries to apply it as they deem necessary. Countries have come together to use arbitration successfully in international commercial disputes. Many countries also use arbitration for dispute resolution in their public sectors, especially for their most important services (such as firefighters and police officers).

There are many variations of arbitration for governments to use. There are conventional, final offer, interest, grievance, high-low, and night baseball. There are even hybrid forms, including mediation-arbitration and arbitration-mediation. It seems likely that there will be more forms developed going forward. Arbitration has both benefits and drawbacks, but can be an important tool for conflict resolution if done properly.

# Artificial Intelligence and the Future of Labor Market in Bangladesh

Shah Md Azimul Ehsan
Department of Public Administration, Faculty of Social Sciences, Jagannath University, Dhaka, Bangladesh

## Synonyms

Future of labor market in Bangladesh; Impact of artificial intelligence on the labor market of Bangladesh

## Definition

Artificial Intelligence, or AI, is the collection of multiple technologies that allow machines to detect, understand, act, and learn either on their own or to augment human activities.

## Introduction

Since the last decade, Artificial Intelligence (AI) has become a buzzword that has drawn the attention of researchers, academics, policymakers, business owners, and practitioners across the globe. AI is not a new term, rather it was first coined by John McCarthy, back in 1955 (Deowan 2020). However, of late, there has been remarkable progress and much development in its usage and applications (Stone et al. 2016). In fact, the wide application of AI technologies, automation, robotics, and machine learning is fueling the "fourth industrial revolution" and taking human civilization into a "digital age" or "machine age" (Islam 2018; Bari 2021).

The proponents of AI who view the future of mankind from an optimistic lens believe that the usage of AI technologies will not only resolve the challenging problems of humanity (Saha and Sarker 2019) but also augment human capabilities which will lead to higher productivity and creation of more employment opportunities with higher pay and better job quality (Lane and Saint-Martin 2021). However, the skeptics harbor a different philosophy and have made alarming predictions that the recent development of AI will be the fundamental reason for large-scale job losses in the upcoming years, which stems from the fact that AI has the ability to automate both routine and nonroutine tasks, and so the planet might be left in desolation (Saha and Sarker 2019; Lane and Saint-Martin 2021). The speculations made by the scholars from the pessimistic bloc cannot be totally ruled out since recent empirical shreds of evidence from the Global South suggest that there has been a gradual transition in the business model of the RMG (Ready-Made Garments) and textile sector (i.e., from decades-old labor-intensive production model to the capital-intensive system) which is resulting in the substitution of humans by the AI and robotics, and further threatening millions of livelihoods in the emerging and low-income economies (Deegahawathura 2018). Thus, it implies that AI applications might also have far-reaching implications on the labor market of a lower-middle-income country like Bangladesh, which has the accolade of being the second largest apparel manufacturer in the world (Ovi 2017). Nonetheless, this gives rise to some critical questions – Will the applications of AI be a zero-sum game for Bangladesh that will entirely reshape the RMG sector's labor market or will it create new employment opportunities? How will the labor market in the apparel industry of Bangladesh look like 20 years from now on, that is, in 2041?

In order to unpack the answer of these questions, this chapter attempts to assess the likely impact of AI applications on the RMG sector's labor market for the next two decades in Bangladesh. The study is qualitative in nature where data has been collected from both primary and secondary sources. Data from the secondary sources (Robson and McCartan 2016) was obtained by an extensive review of the existing literature relevant to the objectives of this study which include books, book chapters, journal articles, newspaper articles, policy documents, consultancy reports, online documents, etc. While data from the primary source was collected from

two experts – an academician, that is, Professor from the University of Dhaka, Bangladesh, and a practitioner in the RMG sector of Bangladesh, by adopting KII (Key Informant Interview) technique through virtual platforms. Having set the scene in the introductory part, the next section will precisely conceptualize AI and then critically discuss the various scholarly debates regarding the implication of AI on the future of the job market. The following section sheds light on how the use of AI technologies will shape the labor market of the RMG sector in Bangladesh in the next two decades.

## AI and Its Impact on the Labor Market

Although the world has witnessed spectacular advances in AI and robotics in the last two decades (Acemoglu and Restrepo 2018) that has resulted in a proliferation of literature in this particular field, both Stone et al. (2016) and Lane and Saint-Martin (2021) note that there is still no universally agreed definition of AI. For IBM Cloud Education (2020), AI is the ability of a computer, machine, or robot that can exhibit human-like intelligence. While Accenture (2018 cited in Aly 2020: 03) has provided a more comprehensive definition of AI as "the collection of multiple technologies that allow machines to detect, understand, act and learn either on their own or to augment human activities." From the synthesis of both these definitions, it can be extrapolated that computer vision, speech recognition, machine learning, robotics, and natural language processing, all fall within the realm of AI (Uddin 2019).

Considering AI's development trajectory of the past two decades, some commentators, Brynjolfsson and McAfee (2014), Zinser et al. (2015), Ford (2015), and McKinsey Global Institute (2017) take the position that the future acceleration of AI could be even more overwhelming that might led to the massive transformation of the works around the world. Arguing in the same vein, a few other scholars like Kurzweil (2005), Callaghan et al. (2017), and Shanahan (2015) opine that at one point, AI might surpass human intelligence which is usually termed as "technological singularity." So, does it mean that human civilization is going to experience something quite similar to science fiction movies where it is often portrayed that machines and robots are replacing the positions of humans? Well, some insights can be obtained from several assessment studies that have been conducted in the last decade for explicitly understanding the pattern and severity of the impact of AI on jobs and livelihoods in the coming years (Makridakis 2017). For instance, renowned Oxford Economists, Frey and Osborne (2013) examined 702 jobs in context to the USA and concluded that 47% of those jobs are at "high risk" of automation over the coming decades. Another study by the World Bank (2016) also drew a similar inference that around 57% of the jobs in the OECD (Organization for Economic Cooperation and Development) countries will be replaced due to automation by the year 2036. Even the findings of two other popular studies, OECD (2017) and McKinsey Global Institute (2017) are also in congruence with the line of argument that the earlier studies have drawn. More precisely, all these studies take a similar stance regarding the fact that a large portion of present jobs done by humans, be it blue collar or white collar, might get automated. Consequently, this has raised an alarm of "automation anxiety" in the global labor market (Islam 2018).

Despite such pessimistic overtone being echoed by the above-mentioned studies, another group of scholars has contested those claims for several reasons. Firstly, Atkinson (2017) has boldly criticized the widely cited studies of Frey and Osborne (2017) and McKinsey Global Institute (2017) for having methodological flaws which fail to provide a holistic picture of the future job market. Secondly, both Islam (2018) and Lane and Saint-Martin (2021) argue that just because a certain number of jobs have been termed as "highly exposed" to automation does not really mean that they will be totally replaced or automated any time soon. Because legal, regulatory, societal, and economic constraints will inevitably slow down the pace of the transition process that will give ample time for both the institutions and the labor markets to adjust.

Thirdly, this group of researchers (Pew Research 2014; Brynjolfsson and McAfee 2017; Acemoglu and Restrepo 2018) further argue that AI will not only eliminate a swathe of jobs in the future but also will create new occupations that perhaps never existed before. They refer to previous industrial revolutions that stoked similar fear of job losses although it was later proved to be incorrect. Instead, it was found that those technological revolutions eventually increased more employment opportunities that resulted in a surge in labor pay.

Notwithstanding the counter-arguments made by the optimistic scholars, the pessimists firmly maintain their precautionary principle which stems from the fact that, unlike previous technological revolutions which flourished rather at a snail's pace, the current AI applications are accelerating at such a velocity that will eventually make it extremely hard for both institutions and market to endure with. Albeit they acknowledge that better-paid jobs might be created over time due to AI usage, however, they further have raised concerns that it will create new challenges for the emerging economies. This is because the newly created employment opportunities will require a higher level of both technical and cognitive/non-cognitive skills, which unfortunately are very much nonexistent in the developing economies. Thus, they conclude that it will only add more burden to the overall labor market of these low-income economies, which already are suffering from the overhang of unemployment and under-employment (Oxford Martin School 2016; Yusuf 2017).

From the above discussion, it is evident that the scholarly debate on this topic has revolved around a dichotomy, which offers two contrasting narratives. On one hand, the optimistic studies have emphasized the complementary and creation effect (positive implications) of AI on the job market, while on the other hand, the pessimistic studies have put much of their argument on its substitution effect (negative effect). Nonetheless, Autor (2015), Bakhshi et al. (2017), and Bloom et al. (2018) have brought another dimension and suggest that for making an objective futuristic assessment about the impact of AI on the labor market for a particular sector of an economy, total effect (a summation of complementary effect, substitution effect and creation effect) has to be measured. Hence, this paper will also use a similar strategy to map the likely impact of AI applications on the labor market of the RMG sector in Bangladesh, which has been discussed in a more detailed way in the next section.

## How AI Applications Will Shape the Labor Market of RMG and Textile Sector of Bangladesh in Next Two Decades?

Bangladesh proudly holds the title of being the - second-largest exporter of RMG products in the world. Since its inception three decades ago, the RMG and textile sector has been playing a pivotal role in uplifting the nation's economy through the injection of numerous jobs in the labor market that has helped to push down the poverty level (Ahmed et al. 2019; Khan 2019a). The total export earnings from this sector are 84%, and its net contribution to GDP is around 16% (Uddin 2018). Moreover, it has also greatly fostered female participation in the labor market. Of the total 4.4 million workforces currently employed in 4222 garment industries throughout the country, 80% are female (LightCastle Analytics Wing 2018). Before making a discussion about how AI applications and automation might shape the fate of this huge labor force in this sector, it's important to understand how this export-oriented business functions.

The entire RMG and textile business operates based on the supply chain management model which is composed of four interconnected factors, viz. – supply chain, lead time, wage, and compliance (Hasan 2017). More specifically, in this model of production, a developed country designs an RMG product that is sourced for manufacturing at lower-income countries, like Bangladesh, Vietnam, or Cambodia, to exploit the cheap labor. However, due to the nonavailability of raw materials required for production in the sourcing destinations, these manufacturing countries have to depend on developing countries, like China. Once the finished product is ready, it is sold to both developing and developed countries. The

interesting picture that the RMG and textile value chain reveals that the manufacturing countries are placed at the lowest segment even though they have to bear a high amount of risk (Hasan 2017). Bangladesh's regional peers in this business are India, Pakistan, China, Vietnam, and Cambodia, who are relatively well-placed in terms of the supply chain, lead time, and compliance factors compared to Bangladesh. More specifically, both Vietnam and Cambodia need almost half of the lead time, that is, 20 days compared to Bangladesh's lead time of 40 days (Ahmed et al. 2019). Similarly, Pakistan, India, and China have the upper hand compared to Bangladesh due to the availability of domestic sources of raw materials. Nonetheless, the competitive advantage for which Bangladesh has been outperforming its competitors is low wages (Hasan 2017). But having only wage competitiveness compared to the competitors has itself made the sector quite vulnerable. In fact, it has become a serious issue to ponder for Bangladeshi RMG and textile industries about how the business can be sustained amidst a fiercely competitive market environment which offers plenty of options for the developed countries for outsourcing. The strategy that some of the Bangladeshi RMG and textile industries, for instance – Mohammadi Fashion Sweaters Ltd., Envoy Textiles Ltd., Karim Textile, Khalil Knit Composite Ltd., Akij Textiles, and a few others (see Table 1) have recently adopted is the application of AI, that is, they have turned to automation and technology for maintaining a competitive advantage (Khan 2019).

**Artificial Intelligence and the Future of Labor Market in Bangladesh, Table 1** Recent automation and AI applications in the apparel sector of Bangladesh. (Adapted from Khan (2019))

| Name of the RMG industry | Recent interventions that have been made |
|---|---|
| Envoy Textiles Ltd (ETL) | At its Bhaluka factory, ETL has installed 14 robotic autoconers in spinning and rotor. This has resulted in boom in production, that is, 55 tons of denim yarn/day |
| Mohammadi Fashion Sweaters Ltd | They have installed 173 German-made automated knitting machines for knitting black sweaters. This has drastically limited the intervention of garment workers to only designing the case program or cleaning the machines |
| Karim Textile | They have installed two robotic auto-cutters and six European automatic fabric spreading machines in their cutting section |
| Khalil Knit Composite Ltd | They have equipped a dyeing laboratory with hyper-technical appliances like Robolab, which is totally a computerized automatic dispenser. It can contain 240 bottles and make measured, error-free recipe dispensing for dye house in working conditions of fully robotic motion |
| Akij Textiles | In order to increase both productivity and quality of the end product, they are using "automatic rotor spinning machine" called robotics piers carriage on Schlafhrost Autocoro |

Again, several functions in the textile and apparel industry make a strong case for AI application in this sector (Uddin 2018). The transformation of fabric to readymade garments involves 14 stages (Khan 2019a, b). In each of these phases, be it the identification of the fabrics and grading stage, or in dyeing and manufacturing stages, AI can be effectively used (Uddin 2019). The adoption of these technologies has so far proven to be extremely beneficial for the above-mentioned Bangladeshi apparel units. Along with quantitative and qualitative improvement of RMG products, these industries have experienced a reduction in lead time which has consequently resulted in enhanced profitability. However, the downside of automation has been that it has led to a reduction in labor dependency (Khan 2019b). Moreover, there have been several reports regarding workers being laid off. For instance, a recent study conducted by Behtarin et al. (2020) found that because of ongoing automation, a good number of sweater factories terminated their workers as jacquard machines are capable of doing a similar job with much efficiency and effectiveness. Although large-scale termination of RMG workers has not yet begun since only big garment factories have started using AI applications; that

however, does not mean that there is not much to worry about the future job losses that might take place in this sector. Especially, with the advent of "sew-bots" (an entire assembly line maintained by robots which can not only pick a piece of garment but also arrange it appropriately and later sew it), the fear about job cuts in the garment and textile factories has become very much persistent (Ahmed et al. 2019; Crabtree 2018). A few estimations have predicted that because of ongoing automation in RMG and the textile sector, there might be 64% and 88% job cuts in Indonesia and Cambodia (Ahmed et al. 2019). The scenario should not be very different in the Bangladesh RMG sector as well, given the huge volume of low-skilled workers it employs who are mostly involved in doing manual and repetitive jobs. A recent study, jointly conducted by a2i (Access to Information Program) and ILO, adopting the similar methodology developed by Frey and Osborne (2013), estimates that 60% of the current workforce (i.e., 2.7 million) in the Bangladesh apparel sector might lose their jobs by 2041 (see Fig. 1) (Ahmed et al. 2019). Anir Chowdhury, the policy advisor of the A2i Project, stated that the real number of job losses might be much higher as these are just conservative figures (The Daily Star 2018a, b).

The study also specified the major areas of this sector which are most exposed to automation and AI applications (see Table 2).

Although automation might lead to a huge number of layoffs, the study further speculates that it will also inject many new jobs in the labor market (see Table 3).

However, the creation of these new jobs does not mean that the existing low-skilled workers in the RMG sector will be able to undertake those specialized roles owing to skill mismatch. Moreover, garment owners also might not deem the retraining and upskilling option of these large number of labor force viable as it will be both time-consuming and have high-cost implications. Rather, they might opt for using more sophisticated automated technologies induced by AI for sustaining a cutting edge in the business. As a matter of consequence, there is a high possibility of workers getting outnumbered by machines in the next two decades, as has been the case in few Chinese RMG factories (Saadat 2019). In addition, there is a high possibility that the gender composition of this sector's labor force might drastically change. An independent think tank in Bangladesh, CPD (Centre for Policy Dialogue) found that automation in the garments sector is already causing more job cuts of female workers

**Artificial Intelligence and the Future of Labor Market in Bangladesh, Fig. 1** Risk of automation in job sectors by 2041. (Adapted from Ahmed et al. (2019))

**Artificial Intelligence and the Future of Labor Market in Bangladesh, Table 2** Major jobs in the RMG and textile sector which are most exposed to automation. (Adapted from Ahmed et al. (2019) and Khan (2019))

| Occupations | Possible number of job losses |
|---|---|
| Sewing operators who operate single needle lockstitch machine, double-needle lockstitch machine, single and double-needle chain stitch machine, sewing machine mechanic | 500,000 |
| Floor supervisor, pattern maker | 10,000 |
| Pattern making for knitwear, quality control, production planner, merchandiser | 10,000 |
| CAD–CAM operator, fashion designer production planner, and controller, portfolio developer | 5000 |

**Artificial Intelligence and the Future of Labor Market in Bangladesh, Table 3** Emerging new occupations in the RMG and textile sector. (Adapted from Ahmed et al. (2019) and Khan (2019))

| New occupations | Areas of application |
|---|---|
| Artificial neural network expert | Fabrics inspection, color solutions, garment inspection, supply chain, and retail management |
| Computer-aided process planning professional | Production planning linkage between CAD and CAM |
| Automated inspection | Fabric trims inspection |
| Computer-aided quality-control professional | Garment inspection and statistical process control |
| Automated material handling devices | Fabric, pattern, and semi-finished garment handling |
| Computer-aided training professional | Intermediate testing of semi-finished materials or final inspection |
| Pick and place robot operator | Fabric handling for sewing |
| Automated fusing and pressing machine operator | Fusing and pressing operation |
| Enterprise resource planning expert | Fabric storage, spreading, cutting, sewing, pressing packaging, human resources, inspection, supply chain, and retailing |
| Numerical controller | Sewing, buttonholing and button attaching |

than their male counterparts for the last few years. This has mostly happened because of the stereotyped mentality that female labors are not worthy of being retrained (The Daily Star 2018b).

Regarding the possible implications of AI applications on the RMG and textile sector's labor market in Bangladesh, one of the senior Professors from the Department of Development Studies, University of Dhaka, stated that:

> Well, to be honest, AI applications in RMG and the textile sector will create few pockets who will reap its benefits. However, those benefits won't filter down. Many small and medium garment factories will suffer to cope up with the emerging scenario. And so, there is a strong possibility that Bangladesh will see many mergers and acquisitions, particularly in this sector in the next few years. Already it is evident that the new jobs that automation and AI applications will generate will require more specialized skills. The worrying factor for the nation is that there is an adequate shortage of such skilled labor both within the existing RMG and textile units and also in the entire labor market in Bangladesh. Moreover, as there is very little linkage with the tertiary educational institutions and RMG and textile industries, there is no such assurance that the vacuum will be filled up from the supply of fresh graduates that each year these institutions produce. Consequently, this will create more dependency for expatriate workers in Bangladesh for bridging that gap. Anecdotal evidence suggests that the sector employs around 4,00,000 to 5,00,000 Indian and Sri Lankan nationals who are highly skilled and occupying the middle and senior managerial positions in different RMG units, although the country suffers from high unemployment and underemployment issues. Thus it means that this figure of expatriate workers will drastically increase in the next two decades which might cause a social disruption. (Key Informant Interview)

Perhaps, the biggest risk that Bangladeshi garment factories might have to encounter in the next two decades is the threat of reshoring, as cheap labor is no longer a necessary factor for producing RMG and textile products (Yusuf 2017; Khan 2019; Green 2017). In this regard, Thomasson and Michalska (2017) noted that Adidas has recently shifted their production of sneakers from Asia to the USA and Germany for two reasons-first, the production line by robots will be much cheaper than by humans; second – closer proximity to the main markets. A similar scenario might also take place in Bangladesh apparel

industry which can disrupt the entire nation's economy. Interestingly though, one of the Executive Directors of Babylon Group, who was interviewed had a different perspective regarding this. He stated that:

> Although there is much anxiety about reshoring owing to automation and AI application in the RMG and textile sector, it is very much unlikely to happen. This is because reshoring has its own cost. When the developed countries will do the cost-benefit analysis, they won't find the reshoring option viable. Also, automation and the use of AI in this sector is all about making the production system smoother and sustaining the competitive advantage. It is true that there will be few displacements in this sector's labor force but seriously speaking, there is nothing much to panic about. Similar predictions were made when the Rana Plaza incident happened in Bangladesh back in 2013. Scholars from home and abroad made pessimistic predictions that reshoring will take place very soon. But has it happened? No. Predictions are not always cent percent correct. I believe that cheap labor will still be something that Bangladesh can cash on for quite some time. (Key Informant Interview)

## Concluding Remarks

It is evident from the above discussion that in the next two decades, there might be a massive disruption in the labor market of Bangladeshi RMG and textile sector owing to AI applications. However, the adoption of AI in the apparel sector won't be a zero-sum game for Bangladesh as it will have both substitution and complementary effects. Interestingly though, when compared with its complementary and creation effect (i.e., creation of few pockets for big apparel industries and generation of new high-skilled jobs) with the substitution effect (large-scale job cuts leading to social disruption, dependency on expatriate workers, change of gender composition of labor force, and threat of reshoring), it appears that the negative impact will outweigh whatever positive implications it might create. Therefore, it is pertinent that the Bangladesh government and concerned policymakers plan ahead and act strategically so that adverse effects that might be created in the coming years can be minimized to a certain extent. Firstly, special retraining and upskilling programs should be arranged for facilitating the laid-off workers in settling for other jobs. Secondly, industry-academia linkage is now a crying need to ensure that an adequate flow of skilled labor force can come from the national labor market that will subsequently reduce the dependency on the expatriate workers. Thirdly, special financial incentives should be provided to small and medium garment factories so that they can adjust to the forthcoming automation changes and sustain their business rather than falling prey to acquisition from big brother.

# Artificial Intelligence in the Public Sector

Bernd W. Wirtz and Jan C. Weyerer
German University of Administrative Sciences Speyer, Speyer, Germany

## Synonyms

AI; Intelligent automation; Machine intelligence; Machine learning; Robotics

## Definition

Artificial intelligence (AI) describes the capability of a computer system to perform human-like intelligent behavior and problem solving by means of specific core competencies, comprising perception, understanding, action, and learning.

## Introduction

Artificial intelligence (AI) has become an important topic for government and the public sector around the world (compare for the following Wirtz et al. 2018). This importance mainly results from AI's ability to significantly contribute to the problem solving of long-standing issues in the public sector, such as high turnover rates, large unmanageable caseloads, administrative burdens, long waiting times, and delays in service delivery and language barriers. Accordingly, AI can provide great benefits for governments, the public sector, and society as a whole, including automated working processes, reduced administrative burden, greater working efficiency, as well as improved decision-making and service quality (Eggers et al. 2017). Against this background, governments across the globe are increasingly acknowledging the potential of AI for economic and social progress, introducing specific AI development programs and heavily investing in the field of AI (Wirtz et al. 2018). As a result, a growing number of governments and public authorities have introduced AI applications within the scope of pilot projects (Herman 2017a; Mehr 2017).

However, due to the novelty of AI implementation and use in the public sector, AI applications are still emerging and are therefore not sufficiently known and fully used in the public sector. Likewise, the associated risks and challenges are relatively unknown and thus remain widely unaddressed, potentially threatening the secure and successful implementation and application of AI in the public sector. Against this background, Wirtz et al. (2018) have identified and systematized AI applications and related challenges in the public sector, providing a comprehensive overview thereof.

## AI Applications in the Public Sector

In order to be able to determine the best AI-based solution for a certain objective, requires governments and public authorities to gain a holistic understanding of the manifold AI-based opportunities in advance. In doing so, they need to be aware of and take into account the full range of potential AI applications, including AI-based knowledge management software, AI process automation systems, virtual agents, predictive analytics and data visualization, identity analytics, cognitive robotics and autonomous systems, recommendation systems, intelligent digital assistants, speech analytics, as well as cognitive security analytics and threat intelligence. More particularly, governments and public authorities also need to understand the functional proposition and value creation with regard to these applications. These aspects are summarized and described in the integrated matrix of potential AI applications for the public sector of Wirtz et al. (2018) in Table 1.

## AI Challenges in the Public Sector

While the implementation and application of AI in the public sector can take place in a number of ways, they are also subject to a variety of major risks and challenges. Overcoming these risks and challenges is not only a complex and demanding task for governments and public authorities but also a crucial success factor of AI in terms of effectiveness, security, and acceptance. Against this background, Fig. 1 depicts the Four-AI-Challenges Model of Wirtz et al. (2018) that represents an integrated approach to visualize the key challenges of AI that need to be considered and where necessary systematically addressed when implementing and applying AI-based solutions in the public sector.

The Four-AI-Challenges Model proposes four major dimensions of AI challenges, including AI technology implementation, AI law and regulations, AI ethics, and AI society, which in turn are composed of certain subchallenges.

## AI Technology Implementation

The dimension of AI technology implementation includes the challenges of AI safety, system/data quality and integration, financial feasibility, as well as specialization and expertise. AI safety refers to the challenge of ensuring that an AI application operates in a safe and reliable manner (Boyd and Wilson 2017). Another major challenge is ensuring an appropriate quality and integration of AI systems and data, since these determine the learning success of AI applications and thus also their smartness and performance (EY 2018). Moreover, financial feasibility or insufficient budget are among the most important challenges in the context of AI technology implementation, especially due to the high technological, labor, and training costs (Bughin et al. 2017; Roberts 2017; EY 2018). Finally, the great lack of AI-related specialization in the workforce and the shortage of well-trained AI experts represents a central challenge when it comes to implementing AI applications (EY 2018).

## AI Law and Regulations

The dimension of AI law and regulations comprises the challenges of governance of autonomous intelligence system, responsibility, and accountability, as well as privacy/safety. The governance of autonomous intelligence systems pertains to the challenge of understanding and controlling the often black-box-like behavior and decision-making of AI applications, as well as establishing effective and transnationally compatible governance mechanisms and systems (Bostrom et al. 2016; Gasser and Almeida 2017). Another major challenge refers to legally determining who can be held responsible and accountable for the behavior and decisions of AI applications, which is a controversial issue given that AI applications may defy from human control, leading to a responsibility gap (Matthias 2004; Johnson 2015). The last challenge in the context of AI law and regulations is securing humans' privacy by protecting personal data and sensitive network resources through effective laws and policies (Wirtz et al. 2018).

**Artificial Intelligence in the Public Sector, Table 1** Integrated overview of potential AI applications for the public sector

| AI application | AI value creation and functional proposition | Public sector use cases |
|---|---|---|
| AI-based knowledge management (KM) software | Generation and systematization of knowledge – gather, sort, transform, record, and share knowledge<br>Expert systems can support the codification of the knowledge of KM<br>Use of neural networks enables to analyze, distribute, and share knowledge with others | Clinical documentation powered by AI (Lin et al. 2018) |
| AI process automation systems | Automation of standard tasks; perform formal logical tasks with unpredictable conditions in consistent quality<br>Complex human action processes (formal logical or dangerous tasks) can be transferred to automation systems, which can support humans in performing tasks<br>May include rule-based assessment, workflow processing, schema-based suggestions, data mining, case-based reasoning, intelligent sensor technology<br>Robotic process automation has emerged as a subarea through further technology innovations. This leverages the ability of software robots or AI-driven workers to mimic human interaction with user interfaces of software systems | Faster and higher quality request processing for immigration application forms (Chun 2007)<br>Automated image diagnoses (Collier et al. 2017).<br>Human-computer interaction for repetitive tasks like data entry etc. (Jefferies 2016) |
| Virtual agents | Computer-based system that interacts with the user by means of speech analytics, computer vision, written data input but may also include real-time universal translation and natural language processing systems and affective computing<br>Software that can perform tasks for humans<br>Subareas are chatbots and avatars | Task allocation according to the respective area of responsibility of a specific agency (smart HR services) (Zheng et al. 2018)<br>Virtual nursing assistant (Collier et al. 2017)<br>A chatbot for helping refugees that seek asylum to fill out and search documents (Mehr 2017) |
| Predictive analytics and data visualization | These analytics are based on quantitative and statistical analysis of data.<br>Processing of big data for reporting, prescriptive analysis, and predictive analysis<br>Machine learning as a technical subarea based on algorithms that can learn from data | Control and performance monitoring in public areas for police departments to determine terror threats and crime hotspots for preventive action (Power 2016)<br>Determine high crime-risk situations to secure public transport (Kouziokas 2017)<br>Forecast model to predict water levels (Kouziokas et al. 2017) |
| Identity analytics | Software combined with big data, advanced analytics, and identity access management to control the access to IT systems and automate risk-based identity checks<br>May include deep learning and machine learning, affective computing, and artificial immune systems | Facial recognition software to verify or identify criminals in public areas (Power 2016)<br>AI fraud detection to secure governmental data (Hemken and Gray 2016) |
| Cognitive robotics and autonomous systems | Systems with higher-level cognitive functions that involve knowledge representation and are able to learn and respond<br>Sometimes in connection with affective computing to determine and adapt human behavior as well as respond to respective emotions | Electric-powered autonomous vehicles for public transport (Christchurch International Airport Limited 2016; Jefferies 2016)<br>Robot-assisted surgery (Collier et al. 2017) |

(continued)

**Artificial Intelligence in the Public Sector, Table 1** (continued)

| AI application | AI value creation and functional proposition | Public sector use cases |
|---|---|---|
| Recommendation systems | An information filtering system<br>Software-based systems that screen personalized information to predict preferences of individuals | E-service for government offices to provide personalized information for employees (Cortés-Cediel et al. 2017) |
| Intelligent digital assistants (IDA) | Software based on speech analytics<br>Providing an intuitive interface between a user and a system/device to search for information or complete simple tasks | Connecting federal programs to IDAs to make public service information available for customers (Herman 2017b)<br>IDA-Amelia to help residents locate information and complete applications forms using speech analytics and affective computing (Jefferies 2016) |
| Speech analytics | Software for intelligent recognition and processing of language<br>Understand or respond to natural language<br>Translate from spoken to written language or from one to another natural language<br>May include real-time universal translation and natural language processing systems | Real-time universal translation (Microsoft 2018) to translate speech and text in face-to-face communications in public service settings<br>Administrative workflow assistance with voice to text transcription (Collier et al. 2017) |
| Cognitive security analytics and threat intelligence | Additional application for cognitive technologies to analyze security information through natural language processing and machine learning<br>Interpret and organize information and provide reasoning | Applications like Watson for cybersecurity (Dheap 2017) to support human security analysis in the public sector |

## AI Ethics

The dimension of AI ethics involves the challenges of AI-rulemaking for human behavior, compatibility of machine versus human value judgment, moral dilemmas, and AI discrimination. AI-rulemaking for human behavior refers to the issue of whether it is ethically justifiable to allow AI applications that lack certain human traits and constitutional personhood to determine the rules of human behavior (Wirtz et al. 2018). In addition, the compatibility of machine versus human value judgment represents another important ethical challenge, as it is associated with the difficult task of integrating the ethical principles of human behavior and decision-making into AI applications, in order to prevent AI applications from developing their own system of values that may be a potential threat to humans (Mittelstadt et al. 2016).

Closely connected to this issue are moral dilemmas that refer to the challenge of ethically educating AI applications in such a way so that they are able to make ethical decisions in situations where only negative outcomes are possible, including life and death decisions (Conitzer et al. 2017). Finally, AI discrimination as another ethical challenge involves the development of measures that help to eliminate discriminatory behavior and decisions of AI applications as well as to prevent the transmission of discriminatory prejudices and stereotypes from humans to AI applications, particularly in the course of AI programming and data transfer (Citron and Pasquale 2014; Mittelstadt et al. 2016).

## AI Society

The dimension of AI society includes the challenges of workforce substitution and transformation, social acceptance and trust in AI, as well as the transformation of H2M/M2M interaction. Workforce substitution and transformation represents a major social challenge, as AI applications will replace and complement human labor leading to high unemployment as well as changed job profiles and requirements that demand AI-specific skills (Bataller and

**Artificial Intelligence in the Public Sector, Fig. 1** Four-AI-Challenges model

Harris 2016; Manyika et al. 2017; EY 2018). Another social challenge in connection with AI refers to establishing social acceptance and trust, overcoming current concerns and uncertainties in society with regard to AI and its potential risks (Fast and Horvitz 2017; Johnson and Verdicchio 2017). Finally, the transformation of H2M/M2M interaction due to AI is also a challenging issue because of the difficulty to reproduce all details of human interaction in AI-related interactions, which is essential for understanding the mode of operation of AI applications and maintaining human control in these interactions (Wirtz et al. 2018).

## Conclusion

AI is a technological concept that is becoming increasingly important to governments and the public sector due to its revolutionary potential to increase the effectiveness, efficiency, and quality of public service delivery. However, AI is still in its infancy stage of development in the public sector and has so far been primarily applied in the context of pilot programs. Against this background, applications for the public sector have been emerging recently, including AI-based knowledge management software, AI process automation systems, virtual agents, predictive

analytics and data visualization, identity analytics, cognitive robotics and autonomous systems, recommendation systems, intelligent digital assistants, speech analytics, as well as cognitive security analytics and threat intelligence (Wirtz et al. 2018).

As AI is increasingly entering the public realm, the great challenges and risks associated with its implementation and application become also more relevant. A consideration and critical appraisal of these challenges and risks, which can be technological implementation-related, legal-regulatory, ethical, and social in nature, is mandatory for a responsible, secure, and expedient approach to AI (Wirtz et al. 2018). Overcoming these challenges and risks will be decisive for the future success and acceptance of AI in the public sector and society. Accordingly, pertinent regulation and risk management will take on an important role in the future.

# Assessing Procurement Reforms in Russia

Konstantin Igorevich Golovshinskiy
National Research University Higher School of Economics (HSE), Moscow, Russia

## Synonyms

Assessment; Contract system; Evaluation; Guideline; Problems of procurement; Purchases in Russia; Recommendations; The Russian Federation; The Russian procurement system

## Definition

Russian Procurement Reforms, its characteristics and assessment, problems and recommendations addressing streamlining of the public procurement system in Russia.

## Introduction

In recent years, Russian procurement system was gradually changing and has attained many achievements.

**The website for placement of information on government procurement.** Over the last 10 years, the system of government procurement has significantly been updated and modernized. The centralized official site, where all tender

notices are published, is created. The official site is the full-fledged instrument of the common market in all territory of the country which allows all participants (irrespective of the place of their stay) to take part in the state or municipal competitions.

**Electronic platforms.** Development of system of the electronic platforms within public procurement since 2005, in fact, is implemented in model of the state private partnership. Electronic platforms give an opportunity of participation in the auctions and signing contracts without any paper. All infrastructure is created by operators of platforms, without investments from the state, which has allowed to save up to eight to ten billion rubles of budgetary funds.

**Procedural control.** Over the last 10 years, the system of procedural control, characterized by high efficiency and speed, has been created. Any applicant can appeal against violations of the competition at all stages of a cycle of public procurement. The number of such complaints is estimated in tens of thousands a year. Many hundreds of purchases are canceled because tender documentation contains rules that violate competition principles or the tender commission illegally rejects more competitive application.

## The Current Reforming

Since 2014 the ambitious attempt to construct service model of public procurement is implemented. It aims to build public procurement in more wider context of state programming and a goal-setting. The adopted Federal law No. 44-FZ is designed to provide the solution of this task.

The ideology of the Federal law No. 44-FZ provides that public procurement is one of the key services providing implementation of state programs. The service ideology creates conditions for effective regulation of a full cycle of ensuring the state needs – from planning of purchase to the final result, through monitoring and emphasis on control of results of performance of contracts, including public control.

## Problems

**Low level of credibility to the market of public procurement. Russian public procurement is indicated with low activity of players.**The low trust leads to a small amount of participants at competitions and finally, to the low level of the competition. In turn it demotivates business to take part in competitions. Confirmation of mistrust of the market to public procurement manifests in extremely low values of average number of participants at a competition (2–2,5 2,5 participants per procedure). At the same time, adoption of the Federal law No. 44-FZ has not changed the situation.

**Corruption level in public procurement remains high.** Neither the official site nor electronic auctions have transformed market of the state and municipal order so far to the mechanism, where always wins the offer which is the most favorable to the state. Many purchases continue to remain an enrichment source for a layer of the corrupted officials, but not means of achievement of tasks of state programs.

**Expenses of customers to run tenders' procedures have significantly grown.** Most of respondents customers have specified that tender process by new rules since 2014 demands huge expenses. Most of respondents have specified on noticeable (in two and more times) growth of the corresponding administrative costs. First of all, these expenses have been connected with the need of preparation of ample volume of documents at a stage of planning of purchases and justification of the prices and also with interaction with regulators (e.g., at coordination of purchases at the only supplier following the results of the competitive procedures, recognized cancelled).

**Low level of quality of service functions of a unified information system of public procurement.** One of the main problems of the **unified information system of public procurement** in Russia is the lack of analytical opportunities. It causes to low quality of planning and internal control in the sphere of procurement. The incompleteness of system of information support of

contract system is shown, first of all, in lack of the catalog of goods, works, and services. It constrains development of system of rationing and other components of system of government procurement.

## Main Directions of Reforming of System of Purchases

The recommendations, given below, are structured into two main parts – on system-wide recommendations (mention system of public procurement in general) and thematic recommendations (affect separate processes of the state and municipal order).

### System-Wide Recommendations

#### Debureaucratization

Rules of ensuring performance of contracts (200 – and more page documentation on purchases), rigid terms of a volume package of documents (preparation of the application demands the appeal on average to three instances), and impossibility to make changes to already submitted application all this averts private business from participation in procedures of purchases.

And on the one hand it deprives of the conscientious customer of an opportunity to select the best proposal of the reliable supplier. The real steps directed to removal of administrative barriers of participation in procurement are not undertaken yet. Moreover, in connection with transition to regulation on the new law the number of documents which should be "collected" for participation in the tender in some cases has even grown. It is necessary to simplify significantly an order of participation of subjects of small and medium business in the auction, to deprive of a possibility of customers to impose the overestimated requirements to participants of competitions/tenders.

It will create an opportunity for providing necessary confirmations not at a stage of submission of applications, but at a stage of signing contract or even performance of the contract. Certainly, the initiative of debureaucratization of purchases should not result in risks of delivery of low-quality goods, works, and services, since there are interests of citizens that are at stake.

#### Personalization of Responsibility

Long time the state reform was based on a paradigm of a detailed regulation of processes. The culture of bribery was offered "to be taken in pincers": on the one hand, to lock the official effectiveness indicators, on the other – to regulate his work with detailed instructions. Administrative regulations of rendering of services and the current legislation on contract system is obvious proof of this ideology's fiasco.

The first step has been taken in the Federal law No. 44-FZ: function of contract officers and the contract managing director is appeared. At the same time, the potential of contract managing staff corpus in a government procurement system is underused. People, who everyday have an opportunity to influence decision-making at the price of several billion rubles, have to work in special system of restrictions and encouragement.

In exchange for more strict requirements to the conflict of interests, use of polygraphs, disclosure of data not only on the income, but also expenses, contract officers have to get access to the compensation packages. It is normal corporate practice. Such approach will allow the state to enter the market of qualitative purchasing personnel and to involve directors of the contract services, having broad corporate experience and, above all, not having "slippery" or negative stories in the track record. For big customers, nondepartmental council has to be engaged in the selection of contract managing directors and employees of contract services.

Reputation mechanisms have to mention not only personnel structure of contract services, but also departments in general. Following the results of a periodic assessment of executive agencies' contract systems (competition level, economy, effectiveness of purchases), the worst departments have to lose the right to use difficult, discretionary and, therefore, more susceptible to corruption ways of purchase. Or they have to step

away and transfer their purchasing function to the centralized service purchasing agency (such as former British Office of Government and Commerce).

### Monitoring Not Only of Procedures, But Also Results

Russia already has experience of creation of effective system of procedural monitoring in the sphere of public procurement. The same pipeline shall be created concerning monitoring of informative results of purchases. Now such functions are assigned to financial monitoring agencies, but actually are carried out by nobody. Any citizen, as the user of results of performance of the state or municipal contract, shall acquire the right to make the complaint to low-quality service (the low-quality road, badly repaired playground, and so on). And authorized body of the power shall quickly consider the complaint and to make the decision, including following the results of instrumental check.

### The Fastest High-Quality Development and Deployment of the Catalogue of Goods, Operations, and Services

Absence of the Catalogue of goods, operations, and services leads to the fact that the main innovations of contract system, designed to provide new quality of system of government procurement, do not work. The Catalogue will allow to pass to different modes of planning of the repeating purchases on standard types of goods, operations, and services.

Absence of the Catalogue is also saving opacity in case of determination of the initial (maximum) price of the contract for standard goods, operations, and services. And it is saving monetary overpayment in a segment of public procurement, which reaches up to 10–15% of total amount of budget funds, allocated for purchases. Now it is impossible to use information on the prices on already held competitions for determination of initial maximum price of new purchase of goods, operations, and services in view of incomparability of names.

Without Catalogue, it is impossible to automate the processes of formation of declarations of purchase, protocols, contracts attracting essential labor costs for customers. Without directory, it is impossible to create complete library of standard contracts, to exercise high-quality control in the sphere of purchases.

Thus, the directory is a rod element of a unified information system, institutes of purchase planning, reasons for purchases, determination of the initial (maximum) price of the contract, and monitoring in the sphere of purchases. And also it provides decisions of indirect tasks of contract system – development of import substitution and stimulation of innovations.

### Electronic Shop

In quantitative expression in public procurement, small purchases dominate. Instead of a straight line of simple purchase, customers are forced to carry out difficult weeks-long procedures. For simple purchases of standard goods electronic shop should be introduced. It assumes placement on electronic platform of notices on purchase with the instruction on category of goods (work, service has to be used), his volume indicators, the initial (maximum) price, and also the required delivery time (rendering, performance). And for commission of small purchases (with the contract price to 10–20 thousand rubles), contract managing directors have to have an opportunity of use of debit cards of widespread payment service providers.

## Thematic Recommendations (Affect Separate Processes of the State and Municipal Order)

Thematic recommendations affect separate processes of the public procurement. The following measures should be also introduced in order to modernize Russian procurement system:

1. To create free for customers online support system (informing and consultation for customers and authorized bodies (organizations))
2. To simplify procurement rules, especially in the sphere of purchases planning

3. To create system of contracts' results monitoring
4. To create project management system focusing on large contracts (from 100 million rubles)
5. To develop and introduce library of standard contracts' forms
6. For reduction of expenses to carry out centralization of functions of purchases for small institutions with creation of uniform purchasing services at the level of their higher bodies of management
7. To provide opportunities for an independent assessment of efficiency of functioning of contract system

## Conclusions

The main drawbacks of the current contract system in Russia are:

- Low level of credibility to the market of public procurement
- Corruption level in public procurement remains high
- Low level of quality of service functions of a unified information system of public procurement

In order to improve the state of arts, some ambitious and resolute actions should be undertaken, aimed at:

- Procedure simplifications and business process streamlining within contract system
- Strengthening personal of responsibility
- Focusing on contract results during internal control performance
- The fastest high-quality development and deployment of the Catalogue of goods, operations and services
- Introducing of government-wide Electronic shop

# Asset Management

Yulia Kasperskaya
Department of Economics and Business Organization, Faculty of Economics and Business, Universitat de Barcelona, Barcelona, Spain

## Synonyms

Corporate asset management; Property management; Real estate management; Strategic asset management

## Definition

Asset management includes all activities aimed at the maintenance and effective use of public assets in order to maximize societal well-being. In its narrower, more practical sense, asset management embraces acquisition planning and the recording, maintenance, and disposal of public assets by government entities and enterprises.

## Introduction

In serving their citizens, national and local governments are entitled to manage public assets of great economic and social value, including, for example, land, buildings, roads, natural resources, gold and currency reserves, and IT systems. Governments are also the guardians of the heritage and cultural assets that have to be preserved for future generations. This management of public assets has become an integral part of the broader package of financial management reforms, aimed at increasing the accountability, transparency, and efficiency of public service provision. In line with privately owned enterprises, today, public entities quantify the value of those assets that can be reliably measured so as to maximize their return to society. Sound asset management has become part of the good governance agenda, which seeks to control corruption, ensures greater governmental

effectiveness and accountability, and provides higher regulatory quality. The main building blocks of effective asset management are (1) faithful asset measurement and reporting, (2) a comprehensive asset register, (3) a supportive institutional and regulatory framework, and (4) the employment of best practices of asset management by government entities. Modern public asset management aims at embracing society's main concerns, such as increasing the efficiency and effectiveness of asset deployment while respecting community needs and the requirements of sustainability.

## Definition and Classification of Assets in the Public Sector

The Public Sector Committee of the International Federation of Accountants (IFAC 1995) defines assets as resources that can be recognized in the financial statements. Such resources should possess the following fundamental characteristics: (1) the existence of service potential or future economic benefits, (2) these benefits should arise from past transactions (future assets cannot be recognized), and (3) the service potential or future economic benefits must be controlled by the reporting entity (IFAC 1995, p. 7). In the public sector, economic benefits, traditionally measured by cash flows, can be substituted for some other social or environmental metric indicating service potential, given that the primary purpose of many public sector assets (equipment, buildings, roads, etc.) is to provide services for the citizens rather than generate profits.

The nature of asset management in the public and private sectors differs (Table 1).

In the private sector, assets are resources employed in production or service provision for the purpose of generating profits. Typically, private enterprises have full ownership rights over their assets, including rights of sale, rent, and disposal. Most of these assets have well-defined useful lives and values. In the public sector, in contrast, assets are employed in the course of service provision, with the primary goal of satisfying citizen well-being. Many asset types, including roads, bridges, monuments, historical buildings, and the equipment employed by government entities, serve the citizens without generating financial wealth. These assets are managed for social purposes only, and the benefits that accrue from their use are shared among all potential users. In this respect, governments are not the ultimate owners of many types of asset but rather their custodians (Pallot 1992). Notwithstanding this, public sector assets do have significant societal value and associated maintenance and preservation costs.

Table 2 identifies and describes the main asset types employed in the public sector.

The classification of assets in each country depends on the specific character of each national and legal context. Cross-jurisdictional differences may exist as to which assets can be considered heritage, infrastructure, or community assets. As Table 2 shows, public sector assets can be broadly classified as financial and nonfinancial assets, while the latter can be further broken down into tangible and intangible assets.

Furthermore, in line with the practices of private enterprises, assets can be classified as *current*

**Asset Management, Table 1** Asset management: public versus private sectors

| Features of asset management | Public sector | Private sector |
|---|---|---|
| Purpose | Maximization of societal value | Maximization of economic and financial profitability |
| Focus | Optimizing service potential | Maximizing return on assets |
| Ownership | Typically, stewardship with rights restricted to control and maintenance of assets | Typically, private ownership with rights of sale, rent, disposal, etc. |
| Useful life | Indefinite for some assets | Definite in most cases |
| Value | Difficult or impossible to define for several asset types | Typically well defined as the acquisition or replacement value |
| Financing | Chiefly, tax revenues and revenues from government debt issuance | Private entity earnings and external debt and equity financing |

**Asset Management, Table 2** Classification of public assets by nature and function

| Type | Description |
|---|---|
| Financial | Cash: coins, paper currency, amounts on demand deposit with banks, checks, foreign currencies<br>A right to receive cash from another entity or exchange financial instruments with another entity<br>Equity instruments (securities) |
| Nonfinancial (tangible) | Inventories<br>Plant and buildings<br>Infrastructure assets (roads, bridges, communication networks, sea defenses)<br>Heritage assets (monuments, museums, national art treasures, historical documents, and buildings)<br>Defense assets (lands, buildings, airports, other facilities for military purposes)<br>Natural resources (petroleum and mineral deposits, forests, fish stocks, water reserves, etc.)<br>Community assets (assets granted to local authorities such as land, parks, historical buildings) |
| Nonfinancial (intangible) | Licenses<br>Rights (using the radio spectrum, fishing, using historical events or personalities)<br>Patents<br>Software systems<br>Brands, lists of customers using services |

Source: Based on IFAC (1995)

and *noncurrent* (long-term) assets. Current assets – for example, short-term securities and inventories – are consumed within a single cycle of service provision. Noncurrent or capital assets, including plants, buildings, equipment, infrastructure, heritage assets, etc., have a longer or indefinite useful life.

Assets may also be classified as *cash-generating* and *noncash-generating* assets. *Cash-generating* assets – such as financial securities, assets held by government enterprises, and investment property – generate profits (cash inflows) in the course of their exploitation. *Noncash-generating* assets – for example, most community and infrastructure assets – serve the citizens without generating profits.

As Table 2 shows, many public sector assets are highly specialized and distinct in nature from other asset types. Tangible nonfinancial assets include heritage, infrastructure, and community assets, as well as natural resources. Heritage assets, such as historical buildings, monuments, archeological sites, and art collections, are elements with great historical and cultural importance. As part of the national heritage, they can be neither sold nor replaced. They have an indefinite or potentially perpetual useful life and are, often, physically irremovable and non-tradable (Aversano and Christiaens 2014; Barton 2005). Infrastructure assets, such as roads, bridges, water and sewage systems, and the like, are defined as integrated systems that provide essential services to the citizens. Many of these assets are also physically irremovable and have an indefinite useful life. Being a common property, they are non-tradable and under the custody of the government (Pallot 1997). It has been suggested that heritage, infrastructure, and community assets should be treated as a separate class of assets in common use, managed by the government on behalf of the citizens (Barton 2005; Christiaens 2004; Pallot 1992).

## Measuring the Value of Public Assets

The aim of the measurement of public assets is the objective valuation of the cost of services and of the operational and financial capacities of the entity in a way that is useful in holding that entity to account and for decision-making purposes. Operational capacity refers to the capacity of the entity to provide the services by employing all necessary resources, while financial capacity refers to its ability to fund its activities. Currently, the International Public Sector Accounting Standards Board (IPSASB) stipulates several approaches to measuring the value of assets, distinguishing between their *entry* and *exit* values (IPSASB 2015a, pp. 107–109), where the former reflect the cost of purchase and the latter reflect the economic benefits from the sale or future use of an asset.

The most common measurement basis, and one widely used in all jurisdictions, is the *historical cost* approach, whereby assets are initially recorded in the financial statements at the cost incurred on their acquisition including possible transaction and installment costs. After the initial record, parts of this cost can be allocated as an expense in the form of amortization or depreciation over the useful life of the asset. The historical cost of an asset is an entry-type value. The historical cost approach is considered to be the most verifiable and objective and, therefore, very useful for holding an entity to account. However, it does not reflect changes in the assets' price over time.

An alternative basis to asset valuation involves current value measurements. Here there are four measurement bases aimed at reflecting the prevailing economic and market conditions at the reporting date.

The first basis is *market value*, defined as the amount for which an asset could be exchanged between buyer and seller in an exchange transaction at the reporting date. The reliability of the market value approach depends on whether markets are active and orderly, as they are in the case of commodities, currencies, and securities. When markets are not reliable and it is costly to obtain information, any asset purchases or sales have to be negotiated individually, and several possible prices might be agreed for a given transaction. In this case, the so-called *fair value* estimation can be employed, where seller and buyer agree on a value based on current market conditions and available information.

The second current value measure, the *replacement cost* approach, can be defined as "*the most economic cost required for the entity to replace the service potential of an asset (…) at the reporting date.*" It includes a residual value, which the entity can obtain from the disposal of an asset (IPSASB 2015a, p. 115). The measure reflects the cost of replacing the service potential of an asset in the course of normal operations and takes into consideration the procurement and construction processes associated with the replacement. This basis can be useful for assessing the value of specialized operational assets for which an active market does not exist. Replacement cost, moreover, is a useful measure for assessing the operational capacity of an entity, but it may require subjective and complex judgments.

The third basis is *net selling value*, defined as "*the amount that the entity can obtain from the sale of the asset (*at the reporting date*), after deducting the costs of sale*" (IPSASB 2015a, p. 118). The net selling price is an exit-type value, and it is entity and market specific. Moreover, it does not require an orderly, efficient market. It can be useful for an asset held for future sale after its exploitation or when there is a contractual obligation to sell an asset at below existing market value.

The fourth basis is *value in use*, defined as "*the present value to the entity of the asset's remaining service potential or ability to generate economic benefits if it continues to be used, and of the net amount that the entity will receive from its disposal at the end of its useful life*" (IPSASB 2015a, p. 119). Reporting an asset at its value in use in the public sector is of limited usefulness. As the measure is usually derived from expected cash flows, it can only be applied in the case of cash-generating assets, if such an analysis is feasible.

Different types of asset require different types of valuation. For instance, the valuation of infrastructure assets can be done at historical cost if records are available or at replacement cost. The valuation of heritage assets at historical cost conveys little information for the users of financial reports and is often not feasible. Therefore, heritage assets, such as artworks, are valued in some jurisdictions at symbolic value because of the difficulties of establishing a fair valuation. In some countries, such as New Zealand, heritage assets have been valued at market values (IFAC 1995, p. 38; Tanzi and Prakash 2000).

According to accounting conventions, non-current, long-term assets should be depreciated. This means that the part of the value of an asset corresponding to a period of its useful life should be stated as an expense, so as to reflect the loss of the asset value. In the public sector, not all assets can be depreciated as it is not always possible to establish their useful life. This is the case, for example, of some heritage and community assets with potentially perpetual life cycles. Overall, the

valuation and depreciation of heritage and infrastructure assets constitute one of the main challenges in public financial reporting, and there has been much debate in the academic literature concerning their recognition and valuation (Aversano and Christiaens 2014; Barton 2005; Pallot 1992, 1997).

IPSASB (2015b) issued specific standards concerning the recognition and measurement of certain classes of asset, including inventories (IPSAS 12); investment property (IPSAS 16); property, plant, and equipment (IPSAS 17); intangible assets (IPSAS 31); and others. It also provides guidelines on impairment disclosure, distinguishing between noncash-generating and cash-generating assets (IPSAS 21 and 26, respectively). While not compulsory, these standards can serve as guidelines for national standard setters of asset disclosure and measurement.

## Financial Reporting of Public Assets

Various financial reporting methods can be employed in the public sector, including cash basis, modified cash, modified accrual, and full accrual accounting. Of these methods, only full accrual accounting requires entities to disclose and depreciate the value of all their recognizable assets, including long-lived capital and intangible assets. This is important when assessing the full costs of government services and the management effectiveness of capital assets. Full accrual accounting provides information about capital assets and the long-term solvency of government entities (Chan 2003).

There is an ongoing debate in the academic literature regarding the appropriateness of the full accrual basis of accounting for the public sector. This is partly due to the fact that for some types of noncash-generating assets, such as heritage, community, or infrastructure assets, it can be difficult at times to establish their value. Despite this, the full accrual method is the one recommended and promoted by the IPSASB, which considers it the most useful in terms of ensuring accountability and for decision-making purposes. Indeed, the countries that pioneered full accrual reporting, including the UK, Australia, and New Zealand, have made significant progress in the registering and valuation of their fixed assets.

In short, asset reporting across countries has yet to be harmonized with different countries using different approaches to value assets. Some assets are not recognized at all in financial statements because of valuation difficulties or because governments continue to use the cash or modified cash reporting bases.

## Public Asset Register

One of the main requisites of efficient public management is the availability of a comprehensive, up-to-date register or cadastre of public assets. Ideally, this register should include the quantity, value, location, and custodians of all public assets in a given country. This is important to ensure the control of public assets, provide a basis for the determination of a country's net worth, help the rating agencies establish national and regional credit rankings, and guarantee efficient asset management (Tanzi and Prakash 2000). New Zealand, Australia, the UK, and France are well-known examples of countries with well-established, comprehensive public asset registers (Grubišić et al. 2009). For example, in 1997 the UK government launched its National Asset Register, which includes all fixed assets and fixed asset investments owned by central government. It also provides details about government acquisitions and disposals of assets (HM Treasury 2007). In Australia, the Ministry of Finance publishes a register of heritage assets on its website. In line with these centralized asset registers, local authorities in some countries publish community asset registers, indicating which assets are controlled by a given entity and including such details as asset location, condition, maintenance requirements, etc.

Recent developments in IT and e-government have seen the use of geographical information systems (GIS) to support the asset management of local government institutions. The use of these management information databases allows

information about major infrastructure, land, and heritage assets to be represented spatially (Gilfoye and Thorpe 2004). GIS can also provide information about asset location, condition, and value and can be used to schedule effectively maintenance and repair work. Their value lies in their ability to facilitate asset management through the sharing of data across different agencies involved, for example, in the maintenance, control, and protection of lands, roads, bridges, parks, water and drainage systems, and the like.

## Institutional and Legal Framework of Public Asset Management

Each country has its own institutional and legal framework for regulating and monitoring its public assets. The institutions involved in asset management operate at different tiers of public authority: central government and government business enterprises, regional and municipal government, and city council entities. Recently, in many countries, institutions with more complex forms of governance have emerged, including public-private enterprises, privatization funds, professionalized advisory bodies, etc. (Grubišić et al. 2009). The legal framework for asset management is comprised of specific regulations, standards, and guidelines, which are drawn up and promulgated by government and professional bodies with expertise in the field of asset management. Asset management legislation includes a broad array of specific regulations and laws concerning land acquisition and disposal, investment property, regimes of concession and leases, protection of heritage assets, property registration and maintenance, etc.

To illustrate one particular national framework, the main government entity in charge of asset management in Australia is its Department of Finance (Department of Finance of Australia 2016). This department acts in accordance with the general legislative framework as stipulated in the Public Governance, Performance and Accountability Act 2013. The Department of Finance is responsible for policies and regulations concerning land acquisition and disposal, public works, the oversight and construction of domestic nondefense property, environmental and heritage assets, and the management of government shareholdings in business enterprises.

Several professional units within the Department of Finance provide expertise in specific areas of public asset management. For example, the Committee of Public Works oversees major public works requiring parliamentary approval. The Property and Construction Division manages major capital work projects on behalf of the government and individual government entities. The Business Advice Branch assists the Australian government in all issues concerning the management of its business enterprises and other commercial entities. The Heritage, Environment and Sustainability Services Panel, comprising experts from privately owned companies, provides support for heritage and environmental asset management.

The Department of Finance also regulates and controls the activities of the Australian government's investment funds, including Future Fund, the Nation-building Funds, the DisabilityCare Australia Fund, and the Medical Research Future Fund. As in the majority of jurisdictions, the oversight of financial assets tends to be separated functionally from the oversight of land, property, and heritage assets due to their different nature.

The Australian National Audit Office (ANAO), for its part, is responsible for ensuring the veracity of financial reporting on asset acquisition, depreciation, and sales. It also conducts performance audits, aimed at demonstrating the effective use of assets, and promotes best practices of asset management for government entities (ANAO 2010).

Regional and local governments may also implement their own asset management policies. For instance, in Australia, the state of Victoria's Department of Treasury and Finance has drafted the *Asset Management Accountability Framework*, which regulates the practices of local agencies accountable to the state government (Department of Treasury and Finance 2016).

In addition to the government entities, professional associations and consulting firms may be engaged to promote the worldwide diffusion of benchmark practices of asset management. For

example, the Royal Institution of Chartered Surveyors, with its headquarters in London, a professional organization that certifies professionals in the land, property, and construction sectors, issues guidelines on best public sector asset management practices (RICS 2008). Similarly, not-for-profit, watchdog organizations may be engaged in the control of public asset management.

## Best Practices of Asset Management in Government Entities

Government entities operating at different tiers of public authority are responsible for asset management to ensure the efficient delivery of their programs and projects. Benchmark asset management practices reflect the principles of good governance, applicable in many countries, including control of corruption, governmental effectiveness, accountability, and transparency (Kaufmann et al. 1999). In particular, asset management seeks to prevent the misappropriation or misuse of public assets, to ensure their most effective use and to provide complete and faithful information on asset decisions to the general public.

The best practices of public sector asset management in many countries have the following features in common. First, asset management forms an integral part of the organizational and strategic management of an entity and is undertaken in accordance with the entity's goals and capacities. Second, a life-cycle costing approach is adopted when the potential of assets is assessed, and entities devise their asset management plans and strategies. Third, the importance of performance assessment in asset management is emphasized, including the estimation of social and environmental outcomes. Fourth, strong control is exercised, and accountability mechanisms are employed when taking decisions concerning asset acquisition and disposal.

While asset management procedures are specific to each jurisdiction and entity, Fig. 1 provides a generic picture of public asset management processes at the government entity level.

A community's needs and a government's mandate influence an entity's decisions concerning the programs and projects required for the provision of services. Operating within its designated budget and adhering to its strategic objectives, an entity defines specific programs

**Asset Management, Fig. 1** Framework for asset management in public entities. (Source: Own elaboration)

and projects together with their corresponding objectives and measurable outcomes.

As a part of its resource planning, the entity reviews its asset portfolio so as to define the most economic and sustainable mix of resources to carry out its projects. At this stage of asset management, an entity analyzes whether the functional or operational capacity of the assets available meets the project requirements. It may also conduct a cost-benefit analysis of alternative asset deployment schemes (i.e., ownership, leasing, or outsourcing) and undertake a risk analysis to assess possible changes in the asset's working conditions.

The outcomes of these analyses can impact the tactical and operational levels of asset management, where the so-called *life-cycle costing approach* to asset valuation can be employed. Life-cycle costing involves tracking the total cost of an asset over its useful life, including costs of acquisition, operation, maintenance, and disposal. The approach is applicable to tangible assets with long life cycles, such as buildings, equipment, vehicles, and the like. The total cost of exploiting these assets often exceeds their acquisition value since many require additional resources for implementing possible repairs, ongoing maintenance, upgrading, and meeting costs of disposal. These costs may also include the costs of materials and consumables, spare parts, specialized labor, and the like. The following formula (Fig. 2) shows the value of an asset under the life-cycle approach.

In practice, future costs may be difficult to estimate since the useful life of some assets can be very long. The discounting of future costs is required, as is the correction for inflation, where applicable. For cash-generating investments, the net present value can be determined.

The life-cycle costing approach ranges from the drawing up of tables to illustrate the projected annual life-cycle costs of specific assets to more sophisticated methods of estimation using probabilistic modeling or scenario analysis. Based on its life-cycle cost appraisals, an entity can draw up operational, maintenance, and disposal plans, including a list of specific actions, their timing, and responsibilities. Due to the specific nature of some operational assets, tactical and operational asset management requires broad expertise in procurement, engineering, logistics, ecology, and human resource management. Future expenditure on asset acquisition, utilization, maintenance, and disposal is reported in an entity's budget, ensuring that the entity has sufficient funds to meet future payments.

In addition to complying with the operational side of asset management, an entity must ensure compliance with accounting and recording standards and the legal practices of its jurisdiction. In most jurisdictions, significant future capital investments, included in capital budgets, need the approval of a corresponding ministry and/or parliament. Depending on the capital investment project, special manuals and codes of practices are drawn up to assist public servants in asset management related to infrastructure, energy, heritage, IT, and other domains. National accounting standards provide the bases for recording asset values, depreciation, and impairment.

An important part of asset management involves the ongoing review of asset deployment and the assessment of asset effectiveness. For this purpose, performance indicators can be employed at various stages of asset management. Such indicators can assist managers in selecting an optimal portfolio of assets, providing them with information about the functional and operational characteristics of assets. Performance indicators can also be used during program evaluation, providing inputs for cost-outcome or cost-effectiveness analyses. Entities also include performance information when reporting to their supervisory bodies

**Asset Management, Fig. 2** Life-cycle cost of an asset. (Source: Adapted from ANAO (2001))

and to the general public for purposes of accountability.

In short, asset management in government entities is a multifaceted process that underpins the specific projects and programs these entities implement so as to meet their planned outcomes and goals. Asset management includes, therefore, the selection of an optimal portfolio of assets, the identification of the complete life-cycle costs of noncurrent assets, and financial and performance reporting in strict compliance with available codes of practice and regulations.

## Conclusion

Asset management in the public sector involves all those activities designed to preserve and manage public assets effectively, with the objective of maximizing societal well-being. Faithful asset measurement and reporting, a comprehensive asset register, a supportive institutional and regulatory framework, and the employment of best practices of asset management by government entities constitute the building blocks of sound asset management.

Public assets are government-controlled resources, the result of past transactions, that have service potential or which are capable of delivering future economic benefits. Assets in the public sector are employed mainly for the societal purpose of satisfying citizen needs, as opposed to generating profits, as is their aim in the private sector. Some public assets, in particular heritage and infrastructure assets, are quite distinct from other asset types in that they are unique, irreplaceable, and physically irremovable, they have an indefinite useful life, and the benefits that accrue from their use are shared by the community.

Assets can be valued in variety of ways, including the *historical* cost approach – the most frequently adopted – and a number of *current* value measures, which include the *market value*, the *replacement cost*, the *net selling value*, and the *value in use*. Different asset types require different methods and national standard setters, and the International Public Sector Accounting Standards Board has developed specific standards for their recognition and measurement. Notwithstanding this, there has been considerable debate among standard setters and academics concerning the valuation and recognition, in particular, of heritage and infrastructure assets.

Full accrual accounting provides the most comprehensive reporting coverage for the asset types employed by government entities. It is the only reporting regime that requires the disclosure of long-lived capital and intangible assets, as well as their depreciation over their useful life. While it is considered the best method for decision-making purposes and for ensuring accountability, there continues to be much debate in the literature given the difficulty in establishing the value of heritage and infrastructure assets and a fair rate of depreciation for them.

A comprehensive register of public assets is essential for sound asset management. These registers are compiled at both central and local government levels and include information on asset location, value and condition, and details of the controlling entity. Some authorities today employ geographical information systems to spatially represent information about major infrastructure, land, and heritage assets and to facilitate their maintenance and preservation.

Various institutions from different tiers of public authority, including ministries of finance (or similar entities), public property committees, professional bodies, and audit offices, develop the legal rules and codes of practice that regulate asset management in their respective jurisdictions. Usually, all major infrastructure projects involving asset construction and acquisition are subject to parliamentary scrutiny and approval. Asset management regulations, specific to each jurisdiction, provide a legal framework for decisions concerning land acquisition and disposal, investment property, regimes of concession and leases, the preservation of heritage and community assets, etc.

Best practices of asset management in government entities adhere to principles of good governance. They are aimed at the prevention of corruption, promoting effective asset use and ensuring transparency in the acquisition and disposal of assets. Asset management practices are tailored to the needs of specific projects and

programs that entities adopt in seeking to meet their strategic objectives and outcomes. Asset management includes the selection of an optimal portfolio of assets; the appraisal of the complete life-cycle costs of capital assets; planning the acquisition, maintenance, and disposal of assets; and undertaking performance evaluation and financial reporting in compliance with national legislation and codes of practice.

# Auction Systems and Public Procurement

Panos L. Lorentziadis
Department of Business Administration, Athens University of Economics and Business, Athens, Greece

## Synonyms

Competitive bidding in public procurement; Public tenders; Reverse auctions

## Definition

The purchase of goods and services by government agencies or state run companies through an auction process by which the tenderer with the lowest price or the most advantageous proposal is selected for contracting.

## Introduction

Supplier selection and the determination of payments for the procurement of goods and services by the public sector is mainly carried out through auction bidding. Auction systems for public procurement are considered to stimulate and enhance competition, leading to efficiency in purchasing. Framework agreements, which are contracts for repeated procurements by short-listing bidding firms, are implemented by auctions. Moreover, auctions discourage corruptive behavior, provided that tendering procedures are open, transparent, and subject to independent audit.

## Requirements and Procedures

Auction systems are designed and conducted strictly following standard procedures which ensure that awarding is objective and non-discriminatory. Additionally, tendering is required to fully comply with different regulations imposed by the national or international legal framework and technical norms. The aim for the purchasing authority is to extract the highest possible utility at the lowest cost. The specific rules and procedures which govern an auction, together with the requisition list and participation requirements, are publicly announced by the purchasing authority, who issues and runs the public tender. These details become explicit in the call for proposals, which must be easily accessible and readily available to any interested party. All tendering procedures are required to be transparent, verifiable, and unambiguous in their implementation. Ideally, all participants should be granted access to the decisions of the contracting authority at the various stages of the evaluation of proposals and awarding. Bidding in a public tender typically requires a participation guarantee as an incentive against potential refusal for contracting. Sometimes, additional participation costs are involved, such as, for example, the submission of samples or a site survey. Adherence to the contract terms is imposed by a performance bond for a percentage amount of the contract, submitted by the auction winner before the conclusion of the procurement contract. Other penalty clauses for liquidated damages may also be present at the contract.

A preliminary screening of the qualification of participating agents ensures that bidders have adequate financial and technical capacity to complete the procurement project. The selection criteria for awarding could be either entirely based on the bid price or they could be multidimensional taking under consideration differences in terms of quality among the proposals.

## Price-Only auctions

In the case of price-only competition, the purchasing agent specifies the minimum quality standards that must be met by each tenderer. Awarding is made to the proposal with the lowest price, provided that the project's technical specification is satisfied in full. The most widely used formats of tendering are the sealed bid first-price and the English auction. In first-price tendering, sealed proposals are submitted to the purchasing agent, and the winner receives as payment, upon the successful completion of the procurement, the respective price, which is the lowest bid. In the English descending auction, the auctioneer gradually reduces the price eliminating the tenderers who drop out. Awarding is made to the last remaining bidder who will be paid for the procurement the lowest price level reached. A variation of this procedure, which is less common, is the sealed bid second-price (or Vickrey) auction, in which awarding is made to the lowest price bidder but the payment received is equal to the second-lowest price. In the Dutch auction, which is less frequently used in public procurement, the price is step-wise elevated up to a level where the first bidder agrees to contract. The

preset budget of the project, as determined by the purchasing authority in the call of proposals, serves as the reserve auction price, above which no bid is acceptable.

Game theory provides a prescriptive quantitative analysis on optimal strategies for bidding and the design of auction systems, under the assumption that all players behave rationally optimizing their payoffs or, more generally, their utility (Lorentziadis 2016).

## Price-Only Auction with Independent Private Cost

Under the independent private value paradigm, the cost of each bidder is viewed as an independent realization of a random variable, which takes values under the same probability distribution. The individual cost of supply remains private information of each bidder. In this symmetric framework and provided that all tenderers are risk-neutral, both the sealed first-price and the English auction result to the same procurement cost for the contracting authority on the average (Krishna 2010). The dominant strategy for each bidder in the English auction (and in the second-price auction) is to bid until the price level drops to the respective individual cost. In a sealed-bid first-price auction, the equilibrium price of a tenderer is the expected value of the minimum cost of the opponents under the condition that it exceeds the individual cost of the particular bidder. If tenderers are equally risk averse, in the sense that they would prefer to bid with less uncertainty when the expected payoff is the same, then under sealed first-price tendering, the expected cost for the buyer is lower compared to the English auction. The rationale is that in the first-price tender risk aversion triggers a lower mark-up in an effort to reduce the uncertainty of winning. On the other hand, in the English auction, the dominant strategy remains bidding at cost which implies that risk-aversion has no effect. When bidders are financially constrained, a first price auction should be preferred by the purchasing agent as competition tends to become more aggressive compared to an English auction. When the cost of the tenderers does not follow the same probability distribution, the two auction systems cannot be ranked in general with respect to the project cost. Nevertheless, purchasing authorities usually find first-price auction more preferable due to the form of asymmetry, which is often displayed by the bidders.

## Price-Only Tendering with Interdependent Cost Signals

In many cases, the exact cost for project completion is unknown to each bidder, who only receives an imperfect noisy signal of the actual cost involved. These signals are usually interdependent as the underlying project is the same. For this reason, a signal, which is low due to randomness, may mislead the bidder to underestimate the cost involved, resulting in more aggressive pricing. Therefore, the winner of the auction may be surprised to find out that profit is reduced or even negative. This complication, known as the "winner's curse," can be alleviated by an additional mark-up. When bidders are symmetric and the signals exhibit a strong form of correlation, which is termed affiliation, the procurement cost of the buyer under an English auction is lower compared to sealed first-price tendering (Milgrom and Weber 1982). Moreover, auctioneers should publicly reveal any information which may be useful to the bidders in their cost estimation, in an effort to reduce uncertainty. The purchasing authority is not allowed to discriminate in information disclosure despite potential reductions in the procurement cost. When tenderers hold asymmetric signals for the project cost, the ranking of the English and the first-price auction remains ambiguous. If a group of bidders enjoy an information advantage, such as specific knowledge about the project acquired only by domestic tenderers, the English auction yields a lower procurement cost compared to first-price tendering. In the asymmetric case, the public disclosure of available information may not always be beneficial for the purchasing authority.

## Multidimensional Auctions

Multidimensional auctions take under consideration, together with price, various non-price attributes such as technical, aesthetic, or functional characteristics of the proposal, after-sales support, the duration and extent of the warrantee extended, the length of the delivery time, potential environmental impact, and other points of differentiation. Non-price criteria are expressed in quantitative terms. The individual attributes of each proposal are then aggregated by applying a weighted average. The "quality" aggregate $Q$ captures in monetary terms the non-price dimension of the corresponding proposal. The weights reflect the importance of each criterion. In practice, they are usually ex-ante fixed by the call for proposals, although they can also be determined ex-post, after the proposals become known, by objectively applying a predefined quantitative method, such as data envelopment analysis (Lorentziadis 2010).

Although in purchasing management there is a large number of alternative supplier selection techniques, such as the analytic hierarchy process or the multi-attribute utility theory, in public procurement, the evaluation of competing proposals is usually made by a score rule, which involves the price $P$ and quality $Q$. For example, the score required by EU regulations is the price over quality ratio $P/Q$, which yields the "most economically advantageous tender." The US Department of Defense employs a quasilinear form $S(Q) - P$, where $S(Q)$ is a transformation of $Q$. "A+B bidding," introduced by the US Federal Highway Administration, considers the total cost of highway repair plus the promised project duration multiplied by the daily cost due to increased traffic. In Japan and Australia, the quality over price ratio is extensively used. Awarding is made to the bidder with the best score. In a first-score auction, which is the most common, the winner delivers the promised price and quality. In a second-score auction, the score provided by the winner should match the second best score or, alternatively, the exact price and quantity of the proposal with the second best score.

## Verifiable Quality

In most tenders, the quality is verifiable upon the completion of the procurement and high penalties are imposed for poor performance or default. When the cost of each tenderer is determined by the quality chosen and the individual efficiency in production, which is random for each bidder, and the score function is quasilinear, the first-score and the second-score auctions are equivalent with respect to the procurement cost (Che 1993). When the scoring rule is the price over quality ratio and bidders are symmetric in their cost inefficiency, first-score tendering results in higher procurement cost compared to the second score auction. The optimal scoring rule, which minimizes the project cost, does not, in general, coincide with the buyer's true utility. For this reason, the purchasing authority should downward distort the quality assigned to each bidder instead of adopting a scoring rule which accurately represents utility.

## Uncertain but Verifiable Quality

When the cost of procurement is uncertain but the quality is verifiable, the auction can often be implemented by an incentive-based contract, where payment is contingent on the delivered quality, rather than a fixed-price contract. A cost-plus contract in which the contractor is fully reimbursed for any additional cost is preferable for complex projects where adaptations may be needed and cost-saving is not a priority.

## Unverifiable Quality

In projects where the delivered quality is observable but not verifiable, the purchasing agent is not able to proceed to litigation for poor performance of the contractor. Since black-listing without court decision is not foreseen in public procurement, possible methods to discourage poor quality are to establish a reward or penalty depending, for example, on customer response, or to develop an option contract, such as "purchase upon

approval," which gives the right to reject the supply. Alternatively, the buyer may leverage on the discretionary extension of the contract duration as an incentive for performance.

When the actual quality can only be observed long after the delivery, multidimensional auctions are inapplicable. In such a case, bargaining with one selected contractor appears to be the socially optimal method of contracting.

## Corruption

Corruptive behavior, which is a prevalent issue in public procurement, can take many different forms in the conduct of auctions. Public officials who run the tender may influence awarding in exchange for bribes. Type I corruption is implemented in first-price auction by allowing the winner to increase the price up to the second highest bid. In type II corruption, the favored bidder, who is not the auction winner, is permitted to revise the proposal and slightly overbid the lowest price (type II corruption). An English auction or a sealed Vickrey auction instead of first-price tendering drastically curbs such fraudulent practices. The selection of the favored bidder is usually made before the auction, although sometimes the preferred tenderer is ex-post determined by running a bribe competition or by targeting a bidder among the lowest in price tenderers.

In multidimensional auctions, a corrupt buyer may define the weights of quality criteria in favor of a particular bidder. Alternatively, direct manipulation of the values of non-price attributes may occur, improving the favored tenderer's score. Strangely enough, when corruptive score inflation is low, the procurement cost may sometimes decline, since honest bidders will be forced to bid more aggressively. When the auctioneer enjoys high manipulation power, tendering becomes inefficient at the expense of considerable inflation of the project cost. Second-score auctions are more vulnerable to this form of corruptive behavior compared to first-price auctions. Reducing the impact of quality in awarding and introducing random third-party audits can limit this form of corruption. Rotation of the purchasing staff may also prove useful. Finally, tendering through an electronic platform may impede the ability of manipulation of the submitted proposals.

## Collusion

Bidders may collude to act co-operatively and reduce competition. In the most simple form, a tenderer may receive a payment from another bidder to abstain from the auction or to submit a comparatively high price. More complicated ring formation of colluding bidders is usually led by a "center" player. In bid orchestration, a corrupt government official, who represents the purchasing authority, acts as the "center" of the ring. The simple exchange of information and coordination results in a weak cartel, which ideally raises the winning price to the budget level. A strong cartel, with coordination and transfer payments between the ring members, enables the collusive bidder with the lowest cost to win the procurement at the highest possible price, while the proceeds are distributed by the "center" within the cartel. Payments, however, can make the cartel more visible and detectable to the authorities. The operation of a ring is more stable in an English auction rather than in sealed first-price tendering, because collusive bidders can better imitate competition while deviation in bidding by individual cartel members is more easily controlled. Collusion-proof auction mechanisms have been proposed in theory but their applicability in practice remains limited. With interdependent cost signals, collusion can also take the form of information sharing to improve the estimation of the eventual procurement cost. Auctioneers can reduce the effect of collusion by lowering the budget of the project. Withholding information about the outcome of the tender does not prevent cartel formation, especially when the "center" can dictate bids.

## Conclusion

Governments worldwide spend annually an estimated average of 15% of their country's gross

domestic product in public procurement. Auction systems enhance competition and ensure value for money and best use of taxpayers' resources. Behavioral forces appear to play a key role in pricing decisions and provide a plausible explanation for the frequently observed deviation of actual bidding from the game-theoretic predictions. Purchasing authorities should take into consideration the presence of irrationality, which is widespread in auction bidding.

It is expected that big data analysis will enable government agencies to make increasingly more efficient use of the available information in order to reveal the cost structure of the bidder population. The introduction of risk management tools in auction systems, such as risk sharing, is another challenge in the development of cost-reducing auction systems. Finally, it is expected that purchasing authorities will continue to develop more sophisticated tendering schemes, such as combinatorial or sequential auctions, to better address the increasingly more complex needs of public procurement.

# Auditing

Belén González-Díaz and Roberto García-Fernández
Department of Accountancy, University of Oviedo, Oviedo, Spain

## Synonyms

Audit; Checking; Examination; Inspection; Review; Verification

## Definition

An official examination and inspection of financial accounts and records.

A systematic process which aims to obtain enough appropriate evidence that state organizations are complying with the law (compliance audit) and that they present their financial information in accordance with the accounting principles and standards that apply to them (financial audit).

An independent, objective and systematic review of an organization, program, activity or public function whose aim is to assess the level of economy, efficiency and effectiveness reached in the use of available resources (performance audit).

## Introduction

The Lima Declaration of Guidelines on Auditing Precepts states in Article 1 that *"The concept and establishment of audit is inherent in public financial administration as the management of public funds represents a trust. Audit is not an end in itself but an indispensable part of a regulatory system whose aim is to reveal deviations from accepted standards and violations of the principles of legality, efficiency, effectiveness and economy of financial management early enough to make it possible to take corrective action in individual cases, to make those accountable accept responsibility, to obtain compensation, or to take*

*steps to prevent -or at least render more difficult- such breaches*."

Audit is a cornerstone of good public sector governance (Goodson et al. 2012). Public sector auditing is a systematic process aimed at gathering the right amount of relevant evidence that state bodies are complying with their legal obligations, that they have presented their financial information in accordance with applicable accounting principles and standards, that they manage their resources economically and efficiently, and that they meet the objectives and goals set out in their plans and programs (Fuentes 2013).

A systematic process of pre-established assessment and control practices needs to be developed. Audit work requires prior planning and preparation of methods and procedures which are to be carried out.

Auditors should gather the right amount of relevant evidence concerning legal compliance by undertaking and assessing any audit test which they regard as necessary and which will vary depending on the type of audit involved.

In general, auditors, within their own sphere of responsibility, should ensure that public sector-dependent bodies comply with current law, that financial statements accurately reflect their financial situation and that resource management corresponds with principles of economy, efficiency and effectiveness. As well as traditional audit objectives, such as expenditure control and verification of financial statements, the last few decades have seen the inclusion of the public funds management objective, known as the performance audit. This aims to assess whether the body concerned has been able to reduce costs and whether it has improved the efficiency and effectiveness with which it manages its services.

In order to achieve all of this, controlling bodies apply a set of public sector auditing principles and standards which have been issued by different international institutions and adapted to each country in its domestic legislation.

This entry in the Global Encyclopedia gives a general perspective of public sector auditing in Europe by describing different types of audit and the structure and functions of auditing bodies and those institutions responsible for standardizing audit practices. Furthermore, it describes principles and standards which regulate internal and external public auditing, and also includes regulations concerning private sector auditing, since it also has an influence on public audit.

## Types of Public Sector Audit

Depending on their purpose, public sector audits may be classified as financial, performance or compliance audits.

### Financial Audit

These types of audit attempt to determine whether the audited body's financial statements are presented according to the regulatory framework governing the issuing of financial information.

The reference frameworks for issuing financial information are the International Public Sector Accounting Regulations (IPSAS), the International Financial Information Regulations (IFRS), or other national or international frameworks related to financial information for use in the public sector.

The audit of financial statements aims to reveal as far as possible whether the most important aspects of financial statements have been drawn up according to the financial information reference framework applicable to them. It should also point out whether statements are reasonably presented and provide a true and fair perspective in accordance with their framework and do not contain major errors attributable to fraud or oversight. In this context, the auditor may issue a clean, or unqualified, opinion and thus increase the degree of confidence of any future users of the financial statements.

Public sector financial statements usually involves a statement of financial position, a statement of financial performance, a statement of changes in net assets/equity, a cash flow statement, a comparison of budget and actual amounts, and notes, all of which include a summary of accounting policies and other explanatory information. An example of this can be seen in the following extract from the report to the Public

Accounts Committee on the audit of the Danish government accounts for 2014 (Rigsrevisionen 2015):

> Rigsrevisionen has audited the Danish government accounts for 2014. The audit included an examination of the completeness of the accounts and a comparison of appropriations against the accounting figures.
>
> We have audited the revenue, expenses and appropriations of the departments referred to in sections 5–29 in the main part of the government accounts (summaries, statements of appropriations and accounts, balance sheet specifications and inventories) and in the part of the government accounts where individual items in the accounts and settlement of appropriations are specified. We have also audited sections 35–38 and 40–42 of the government accounts.
>
> Moreover, we have reviewed the departments' explanations of the variances between accounting and appropriation figures that appear from the annual reports for 2014 prepared by the government agencies and bodies under the respective departments.

As well as the traditional audit of financial statements, a financial audit may have as its objective the accounts and other financial reports pertaining to the state or to state organizations: budgets or sections of budgets, allocation and other decisions taken concerning resource appropriation and application, public policy, programs or activities, areas of responsibility, income and payment categories, or assets and liabilities. The following is another example from the report to the Danish Public Accounts committee (Rigsrevisionen 2015):

> The audit also included EU funds in Denmark. Denmark receives funds from the EU and settles duties, levies, VAT and GNI contributions to the EU's own resources every year. EU revenues and expenses are significant and have the attention of the European Commission as well as the European Parliament. Rigsrevisionen therefore issues an opinion on the audit of EU funds in Denmark, which can be found in chapter six of this report.

### Performance Audit

This is an independent, objective and systematic review of an organization, program, activity or public function whose aim is to assess the level of economy, efficiency and effectiveness reached in the use of available resources, to detect possible deficiencies and to make appropriate proposals to management in order to correct these deficiencies in accordance with general principles of good management.

A performance audit supplies fresh information, knowledge or value as it provides new analytical perspectives, makes existing information more accessible to interested parties, and puts forward an independent viewpoint on the basis of audit findings. Furthermore, its recommendations are based on analysis of audit results, which facilitates decision-making or the start of corrective procedures by those responsible.

The aims of a performance audit may be related to one or a number of entities or to an identifiable group of actions, systems, operations, programs or activities, always conforming to principles of economy, efficiency and effectiveness.

- The principle of economy refers to the conditions under which financial, human and material resources are acquired (time, costs, quantity and quality). It entails resource attainment at minimum cost with easy availability and the right quantity and quality at the best price.
- The principle of effectiveness refers to the extent to which predicted objectives and results have been reached.
- The principle of efficiency refers to the relationship between resources used and the results (products), in terms of quantity, quality and opportunity.

The following is an example from the Office of the Auditor General's investigation of Norwegian development aid to the health sector in Malawi (Riksrevisjonen 2013):

> The objective of the audit was to assess the attainment of targets for Norwegian health inputs in Malawi, and the public administration's follow-up and overview of the use of the funds. Another objective was to take a look at the degree to which human resources, medicines, supplies and funds for equipment and infrastructure reach hospitals and health centers.

Sometimes the audit's aim does not link the three principles together and attempts to verify whether

the results obtained by the audited body have reached pre-established objectives (effectiveness audit) or whether it is using its resources economically and efficiently (economy and efficiency audit).

The performance audit is also known as the "value-for-money audit".

### Compliance Audit

This aims to verify whether all major aspects of actions, operations and management procedures have been carried out in compliance with the relevant authority that runs the audited body. Authority may include rules, laws and regulations, budgetary decisions, policies and codes or principles that regulate the public sector and its employees.

The main focus of a compliance audit is on compliance with formal criteria such as laws, regulations and agreements. It may, however, aim to verify abidance of general principles that regulate a healthy financial administration and the behavior of civil servants. Such principles could be those which are generally accepted or national or international ones related to good practice, for example, the following extract from "The Audit concerning state sector hiring carried out in the 2012 financial year" (Tribunal de Cuentas 2015):

> Verify compliance with the obligation to provide the Audit Office (Tribunal de Cuentas) with the documentation established by law or public regulations concerning the requirement to present the Audit Office with contract details and the relationship between contracts and collective agreements in the state sector. And analyze the drafting and awarding of contracts and their subjection to existing law.

A compliance audit may be undertaken either independently or together with a financial and performance audit. Any audit which includes all three types is known as an integrated audit. A regularity audit is that which involves a financial and compliance audit.

Similarly, and depending on their purpose, other audits can be carried out; for instance quality, environmental, systems and IT, information, security, management and privatization audits among others.

### Other Kinds of Public Auditing

As well as the three types mentioned above, there are other public administration supervisory and audit categories based on the auditing bodies' status, scope, audit frequency, time of audit and mandate.

- Status
  - *Internal audit*. Undertaken by the public body itself or by state-run organizations and aimed at verifying different procedures and systems in order to analyze anomalies and propose improvements.
  - *External audit*. Undertaken by independent organisms. For public administrations there may be several kinds – those carried out by Supreme Audit Institutions (SAIs), by Regional Audit Institutions (RAIs) and by external private firms.
- Scope
  - *Partial or limited*. Involves checking and analyzing specific aspects so as to be able to give a particular opinion.
  - *Global auditing*. Its scope is determined by the type of audit being undertaken. It will, nevertheless, always cover the audited area fully and globally.
- Frequency
  - *Constant monitoring*. This is carried out permanently throughout the year. Such frequency is more common in internal control given that external audits need to base their assessments on completed actions.
  - *Recurring*. This is repeated cyclically, for instance, annually.
  - *Occasional*. This type of control takes place when an audit is used to clarify problematic situations or when audit costs prevent it from being done annually.
- Time of Audit
  - *Pre-audit*. This is undertaken before completion of the action under review.
  - *Concurrent audit*. It takes place at the same time as the action being monitored is brought to an end.
  - *Post or a posteriori audit*. This is done once an action has finished or a financial statement drawn up. In this case the term "audit" can be applied in its true sense.

- Depending on the origin of the mandate of the SAIs
  - *Imperative*: Undertaken because it is legally required.
  - *Selective or optional*: Undertaken at the behest of the controlling body itself, the auditing body or at the request of the audited entity or parliament, when legislation requires it.

## Public Sector Auditing Bodies. Organization and Functions

Internationally, there are no public sector monitoring bodies as such; rather, there are organizations dedicated to standardization of audit practice, specifically the International Federation of Accountants (IFAC), the International Organization of Supreme Audit Institutions (INTOSAI) and the Institute of Internal Auditors (IIA). In Europe, the European Court of Auditors (ECA) and the Internal Audit Service (IAS) are responsible for monitoring in the European Union (EU). At national, regional and local level the most representative bodies are SAIs and RAIs but this depends largely on the country concerned as it is difficult to generalize about the nature of public sector internal auditing, internal control institutions or top managers.

At European, national, regional and local levels there are organizations which do not establish standards or undertake public sector audits. Generally speaking, these bodies are made up of professional people or institutions that do internal and external auditing of different organizations in order to orient them professionally and to foster cooperation among members and the sharing of experiences. This is the case with the European Organization of Regional External Public Finance Audit Institutions (EURORAI), the European Organization of Supreme Audit Institutions (EUROSAI), the European Confederation of Institutes of Internal Auditing (ECIIA) and the National Institutes of Internal Auditing.

Given their relevance in both the standardization area and in that of public sector control, the structure and functions of some of the above-mentioned institutions will be analyzed next.

### INTOSAI

The INTOSAI is a professional, autonomous, independent, apolitical and international body which represents SAIs belonging to United Nations (UN) member countries. It is a forum which allows government auditors from all over the world to debate matters of mutual interest and also to keep up to date with the latest auditing trends and other applicable standards and better practice. The INTOSAI was founded in 1953 at the first congress held in Cuba. Its headquarters are in Vienna and it has 197 SAI members, all belonging to the UN (INTOSAI 2007, 2013a).

During its more than 60 years of existence INTOSAI has become a fundamental strategic organization, fostering independent and efficient SAIs which, through their technical capacity and competence, help governments to improve transparency and accountability, retain credibility, fight corruption, reinforce public confidence and, ultimately, improve how public funds are used (INTOSAI 2013a).

Various major milestones stand out in the INTOSAI's recent and past history:

- The Lima Declaration of Guidelines of Auditing Precepts from 1977 and the Mexico Declaration on the Independence of SAIs from 2007 comprise the Magna Carta of external government auditing and define the premises for SAIs to be independent and efficient in their practices.
- The INTOSAI Development Initiative (IDI). This was created in 1986 and its aim is to improve the institutional capacity of SAIs in developing countries by implementing training programs for public sector auditors so they will be able to contribute to improvements in transparency and accountability.
- The First INTOSAI Strategic Plan (2005–2010) was a response to the demand for the organization to have a strategic focus. Its application has entailed the drawing up and adopting of appropriate professional standards, the strengthening of SAI professional and

institutional capacity through the Capacity Building Committee, capacity building projects, and voluntary peer review programs which allow best practices to be identified in order to improve audit quality. The plan has also brought about a communication strategy which has improved both internal and external reporting, as well as an international organization model to guarantee economy, efficiency and effectiveness.

- The South Africa Declaration on the International Standards of SAIs from 2010 which calls for SAIs to use International Standards of Supreme Audit Institutions (ISSAIs) as a reference framework for public sector auditing and as a means of assessing their own performance. ISSAIs should be implemented according to SAI mandates and national laws and should be publicized at a global, national and regional level.
- UN Resolution A/66/228: "Promoting and fostering the efficiency, accountability, effectiveness and transparency of public administration by strengthening supreme audit institutions". This acknowledges the role SAIs play in promoting these areas of the state in an international context, outside the confines of INTOSAI.

In order to undertake all its activities the INTOSAI has the following institutions at its disposal (INTOSAI 2007, 2013a):

- The International Congress of Supreme Audit Institutions (INCOSAI) is the highest body, comprising both full and associate members and it meets every 3 years to share ideas and experiences, discuss topics of common interest and approve recommendations aimed at improving public administration accountability. It also has powers related to the structure, management and supervision of the INTOSAI. INCOSAI is where international auditing standards are approved and endorsed.
- The Governing Board comprises 18 members who meet annually in order to provide guidelines, governance and continuity between congresses. So as to ensure a balanced representation of all INTOSAI member states, at least one member of each regional group and each SAI model is guaranteed a place on the committee. Some of its functions entail the approval of annual and tri-annual budgets, determining which SAIs can be part of the INTOSAI, and reviewing and approving the annual report, which includes the audited financial statements for the calendar year ended with comparative statements for the preceding 2 years.
- General Secretariat. Its director is the president of the Audit Office of Austria, where the INTOSAI has its headquarters. The director has executive and attendance functions in keeping with this type of organization.
- Regional Working Groups promote INTOSAI goals at a regional level, giving its members the chance to focus on topics which are specific to their area. There are seven Regional Working Groups: Organization of Latin American and Caribbean Supreme Audit Institutions (OLACEFS), African Organization of Supreme Audit Institutions (AFROSAI), Arab Organization of Supreme Audit Institutions (ARABOSAI), Asian Organization of Supreme Audit Institutions (ASOSAI), Pacific Association of Supreme Audit Institutions (PASAI), Caribbean Organization of Supreme Audit Institutions (CAROSAI), and EUROSAI.

The INTOSAI's technical work is carried out by committees, working groups, task forces and project groups which help to provide a regional balance and reflect different SAI models and approaches. Their work is published in the International Journal of Government Auditing, the INTOSAI's official bulletin for fostering government auditing procedure and techniques (INTOSAI 2013a).

### Institute of Internal Auditors

The IIA, founded in the United States in 1941, is an international organization comprising internal auditors from all over the world. It provides them with standards and guidance on professional practices, certification programs, training and

forums where information and experience are shared. It has 180,000 members from 190 countries.

The Institute is managed by a Board of Directors and it has a number of standing committees which develop and implement programs aimed at achieving IIA goals and objectives.

The national institutes of internal auditing in Europe come together in the ECIIA, together with some non-European countries from the Mediterranean basin. Its function is to improve corporate governance through the promotion of professional internal audit practices. It is governed and managed by the General Assembly Audit Committee and the Governing Board.

In the regional and linguistic areas, institutions which stand out are: the Asian Confederation of Institutes of Internal Auditors (ACIIA), the Federación Latinoamericana de Auditores Internos (FLAI), the African Federation of Institutes of Internal Auditors (AFIIA), and the Union Francophone de l'Audit Interne.

### European Courts of Auditors

The ECA was set up in 1977 by virtue of the Treaty of Brussels and it began to function that same year. The 1999 Treaty of Amsterdam bestowed on it the category of UE institution at the same level as the European Parliament or European Commission. It is a collegiate body comprising 28 members, one for each EU member state. It is divided into five departments, each of which is responsible for, on the one hand, adopting special reports, specific annual reports and legal rulings and, on the other hand, for preparing annual reports on the EU budget and European Development Funds for their adoption by the ECA's plenary session.

The ECA is responsible for external auditing of the EU. Its job is to verify that community funds have been correctly accounted for and have been obtained and spent in accordance with the regulations in force and with the principles of good financial management: economy, efficiency and effectiveness.

The ECA, as an independent auditing institution and SAI, has several functions in the EU: contributing to the improvement of financial management, fostering transparency and accountability to its citizens regarding community funds, providing politicians and citizens with reports and rulings, applying international auditing standards and cooperating closely with member state SAIs which monitor European funds managed and used by individual national governments.

The ECA carries out its activities in conformity with international auditing standards. In order to do so effectively it has put into place long-term plans which define its strategy and annual plans which specify the activities it is going to undertake over the financial year.

It does three types of audits – financial, compliance and management. The ECA's Statement of Assurance, one of the most important audits it carries out, is an annual financial and compliance audit by virtue of which the court audits the reliability and regularity of underlying financial operations in the EU. It is published in the ECA's annual report as part of its output, along with specific and special annual reports, opinions on proposed legislation and general analysis.

### Internal Audit Service

Set up on 11 April 2000, the IAS is a basic part of the internal auditing system of the EU and EU agencies.

The IAS is presided over by the Vice-President of the Commission responsible for better regulation, inter-institutional relations, the rule of law and the charter of fundamental rights. It is broken down into three directorates which are responsible for assessment and the issuing of opinions on internal control system quality and operation in the Commission's departments and organizations and in EU Agencies, executive agencies and other autonomous bodies which receive funds from the EU's budget (European Commission 2015).

The IAS works in conformity with IIA international professional standards and is accountable to the Audit Progress Committee (APC). The IAS reports to the APC on audit results and recommendations it has made, as well as providing an overall opinion on the Commission's financial management and on compliance with its annual auditing plan (European Commission 2015).

At European level, there are other organizations like EUROSAI, the EURORAI or the ECIIA which, although they do not aim to set auditing standards, they do promote the sharing of information and audit experience, inform their members of current legislation and work towards terminology standardization so as to bring about public auditing uniformity.

### Supreme Audit Institutions

These are public state institutions (or belonging to a supranational organization) which independently – with or without judicial responsibility – and in accordance with laws or other formal state or supranational organization regulations exercise the maximum financial control function of said states or supranational organizations, whatever their designation, formation or organization (INTOSAI 2007).

In Europe there are at least three types of SAI: the Napoleonic model, the Westminster model, and the Board system (Dye and Stapenhurst 1998; García 2005; National Audit Office 2005; Wang and Rakner 2005).

- Napoleonic Model (or Court of Accounts System). SAIs have both judicial and administrative authority, are part of the judicial system and are independent from legislative and executive branches. This system is directed more towards compliance audits and less so towards performance audits given that their staff is largely made up of lawyers and magistrates. It is a model used by the Latin countries of Europe (France, Belgium, Portugal, Spain, Italy and Greece). Additionally, they have an advisory function and may also pass judgment on likely irregularities arising from public fund mismanagement.
- Westminster Model. Also known as the Anglo Saxon or Parliamentary Model, it can be found in the SAIs of the United Kingdom, Hungary, Malta, Poland, Ireland, Sweden, Finland, Denmark, Estonia, Cyprus, Latvia, and Lithuania. The SAI is overseen by the Auditor General, who regularly presents to parliament reports, produced by professional auditors and technical experts, on financial statements and performance of government entities. Unlike the Napoleonic model, the emphasis here is on financial and performance audits, with less focus on compliance. These SAIs also act as parliamentary advisors and do not have a judicial function, although they do report irregularities detected while in the course of their work. In this system, the SAI is a key feature of parliamentary control and has a close relationship with parliamentary committees.
- Board System. This is similar to the Westminster model but with a collegiate structure. The German SAI, for example, has a three-member board, including the chairperson. Other countries using this system are The Netherlands, Slovakia, the Czech Republic, Norway and Sweden.

Not all European SAIs fit exactly into these models, but they do get close. In general, legal, financial, political, cultural and social contexts influence SAI structure. Other aspects such as president or auditor-general affiliation to certain political parties, appointment procedures, resource allocation, the type and role of staff members, the kind of bodies they audit, the kind of audit or the way they report results to recipients also have a bearing on structure.

In order to be effective, however, all of them need organizational independence or autonomy from other branches of government, a formal and clear mandate established by their constitution or statutes, adequate funding, facilities and staff to guarantee quality work, unlimited access to all the information they might need while working and adhesion to professional audit standards promulgated by INTOSAI or other international bodies which issue standards (Dye and Stapenhurst 1998).

### Regional Audit Institutions

In some European countries financial monitoring of regional and local government bodies is carried out by RAIs.

Like SAIs, RAIs differ from one country to another or even from one region to another. Germany, Austria, Spain, France, Ireland, Italy, Russia and Switzerland are examples of countries

with regional and local public sector financial control institutions. Their scope of audit activity varies, however, in terms of audit objectives, relationships with other audit institutions, recipients and reporting of their work or the way physical and human resources are allocated. This is largely due to the diversity of their constitutional or regional structures (EURORAI 2004).

Likewise, not all regions within a state, Spain or Russia for example, have control institutions. In some countries like France or Germany control institutions do local body auditing and not exclusively at regional level. Others, in Austria, Russia and Switzerland, do not undertake external control of public finances since they are regarded as internal control bodies (EURORAI 2004).

RAIs are grouped together under the umbrella organization known as the EURORAI. It is made up of RAIs from 15 countries and promotes cooperation among RAIs as well as the sharing of knowledge and experience of auditing public income and expenses so as to guarantee better use public finances in local and regional sectors (EURORAI 2001).

EURORAI is organized firstly through its highest authority, the General Assembly, which is made up of the chairpersons of RAI members and also through its Management Committee and General Secretariat. It is funded by members' fees and other forms of income such as subsidies, donations and earnings arising from the sales of its publications and other activities it is involved in.

## Principles of Public Sector Auditing

The principles that govern any activity have a basis which should be respected. In the context of public sector auditing, its principles are regarded as the main ideas that influence how auditing practice is carried out. Auditing standards are the rules that should be followed in order to put auditing principles into practice.

The INTOSAI establishes in ISSAI 100 the principles applicable to all public sector audit engagement, whatever its form or context. Public sector auditing principles can be classified as general principles and as principles related to the audit process (see Fig. 1).

General principles are those related to auditors themselves; they involve ethics and independence, professional judgment, due care and skepticism, work quality and audit team management and skills. They also cover certain matters that auditors should consider before starting an audit and while it is being carried out – audit risk, materiality, documentation and communication.

- Ethics and Independence. Ethical principles should be part of an auditor's professional behavior and the auditor should have an independent, objective attitude towards the entity being audited and other external special-interest groups.
- Professional Judgment, Due Care, and Skepticism. An auditor's professional conduct entails the use of knowledge, skills and collective experience during the audit process (professional judgment). Auditor conduct also calls for careful planning and carrying out of audits (due care) as well as professional detachment and an alert attitude as to whether evidence which comes to light during an audit is appropriate and sufficient (skepticism).
- Quality Control. This refers to the use of quality control systems in order to guarantee, on the one hand, that auditors are complying with professional standards and applicable legal requirements; on the other hand that the reports they produce are appropriate.
- Audit Team Management and skills. People in the audit team should be aware of, and have practical experience in, the type of audit they are going to undertake. They also need to be familiar with applicable regulations, have some knowledge of the organization they are auditing and have the right capability and experience to make a professional judgment.
- Audit Risk. This refers to the possibility that an auditor's opinion or conclusions may be wrong after carrying out a full audit procedure.
- Materiality. The auditor should bear in mind materiality, or relative importance, throughout an audit. Relative importance is understood as the criteria used to assess the effect any

**Auditing, Fig. 1** Areas covered by the principles for public-sector auditing. (Source: INTOSAI 2013b)

oversight or inaccurate information might have on a reasonable person and whether these would affect his/her judgment.

- Documentation. Auditors should prepare audit papers in sufficient detail so as to allow for easy understanding of the work undertaken, of the evidence obtained and of the conclusions reached.
- Communication. The auditor is responsible for establishing effective communication throughout the audit. This entails participation by the audited entity's management in the auditor's responsibilities within the audit framework, in gathering information relevant to the audit as well as providing management with opportune advice, observations and suggestions as they arise during the audit process.

The *principles related to the audit process* can be linked to the planning phase, conducting the audit and the production of audit reports as well as follow-up of any matters arising from the reports.

- Planning. Auditors need to plan their work in order to identify the aims of the audit in question. During this phase auditors should learn about the entity or program about to be audited, assess audit risks via procedures which include looking at and rating internal control processes and weighing up the risk of fraud. They also require guarantees that the audit will be undertaken economically, efficiently and effectively, which means that audit procedures will need to be appropriate to the aims and risks involved and that the right human and technical resources are in place; otherwise, people with the required skills should be brought in.
- Conducting the Audit. Auditors conduct audit procedures which allow them to compile evidence that backs up their conclusions. Evidence comprises information gathered by the auditor so as to document whether a matter complies with applicable criteria. Evidence may be documentary, physical, testimonial or analytical and it should be ample and appropriate. Evidence at this stage should be assessed and conclusions should be reached.
- Production and Follow-up of Audit Reports. Auditors need to draw up a report to convey audit results to legally entitled recipients, to the body which has been audited and to the general public. Reports should be pertinent, easy to understand, objective and well grounded. Their full extent will depend on whether or not their scope, findings and conclusions are specified. The same can be said for their potential consequences and recommendations, which may be limited by legal requirements, financial audit internal control mechanisms, legal compliance and performance audit management. Auditor performance does not conclude with the production and submittal of the report; recommendations need to be monitored until faults are corrected.

## Public Sector Auditing Standards

As for standards which cover the public sector, it is necessary to distinguish between international and European standards and those applicable at a national, regional or local level. There is, however, a tendency these days towards uniformity of standards.

### Auditing Standardization at an International Level

*Internationally*, the IFAC, the INTOSAI, and the IIA issue auditing standards which are applied in public sector audits.

The IFAC and INTOSAI are institutions whose professionals and SAIs do external audits; the IIA does internal auditing.

#### IFAC

The IFAC does not issue specific public sector auditing standards as it considers that the standards drawn up by one of its boards, the International Auditing and Assurance Standards Board (IAASB), are applicable to all audit work, whatever the sector in which the audited entity operates (Miaja 2013).

IFAC formulates high-quality international auditing and assurance standards: specifically, 36 International Standards on Auditing (ISAs) concerning general principles and responsibilities (200–299), risk assessment and response to assessed risks (300–499), audit evidence (500–599), using the work of others (internal auditors, auditor's expert) (600–699), audit conclusions and reporting (700–799), and specialized areas (800–899).

All ISAs are structured in the same way:

- Introduction. This explains the ISA's purpose and scope as well as auditor responsibility within the context established by the ISA.
- Objective – describes the objective sought by the auditor when applying each ISA.
- Definitions. Each ISA contains a definition of the terms it uses and how the terms refer to the area where the ISA is applied.
- Requirements – are established for auditors to comply with in order to reach the objectives sought when applying each ISA. Requirements always start with the words: "the auditor shall. . ."
- Application and Other Explanatory Material. The content and purpose of a standard is

explained in more detail through complementary material which expands on information given in previous sections. Also included are examples or opinions concerning ISA application to public sector or other audits.

The IFAC also releases a range of declarations on professional auditing practices and is involved in other work concerning reviews, assurance and related services.

### INTOSAI

INTOSAI, since it was set up, has issued auditing standards based on the Lima and Mexico Declarations from 1977 to 2007 respectively. Standards have also been based on conclusions and recommendations adopted at INTOSAI congresses and work carried out by the UN think tank dealing with accounting and auditing in developing countries.

These standards, which reflected the general opinion of SAIs concerning best audit methods and practice, were not, at first, binding. INTOSAI, however, in its strategic plan (2005–2010) pledged to draw up a framework of international standards. The outcome of this was the approval by all INTOSAI members of the *South Africa Declaration on the International Standards of Supreme Audit Institutions* during INTOSAI's 10th congress held in Johannesburg en 2010.

Thus, SAIs are required to guarantee that these standards are used as the common reference framework for public sector auditing and to foster and implement them, both nationally and regionally, in accordance with national mandates and legislation. Their use provides SAIs with permanent access to a common, broad framework of up-to-date auditing standards, adds credibility to their auditing work, promotes public sector transparency and improves work quality. They also improve the professional image of SAIs and allow for joint audits to be conducted (Elmose 2011).

INTOSAI has drawn up two kinds of professional standards: the ISSAIs and the INTOSAI Guidance for Good Governance (INTOSAI GOV).

The ISSAI framework involves a two-pronged approach: on the one hand, the General Auditing Guidelines on Financial Audit are defined on the basis of the ISAs issued by the IAASB of the IFAC; on the other hand, INTOSAI produces its own General Auditing Guidelines on Compliance Audit and Performance Audit and Guidelines on Specific Subjects.

Every standard is given an ISSAI number of between 1 and 4 digits which indicates the document's ranking. Table 1 includes current guidelines, their designation and approval date.

ISSAIs are classified into four levels.

- Level 1 Founding Principles (ISSAI 1) are contained in the Lima Declaration and their main purpose is to protect SAI independence.
- Level 2 (ISSAI 10–99) are pre-requisites for the functioning of SAIs. They contain declarations about correct SAI functioning and professional conduct which are relevant to all public audits in terms of independence, transparency, accountability, ethics and quality. The Mexico Declaration on the Independence of SAIs can be found at this level.
- Level 3 (ISSAI 100–999) comprises fundamental auditing principles, 4 in total, which provide a general outline of audit procedure and report writing. ISSAI 100 gives detailed information about the ISSAIs' purpose and authority, the reference framework for public sector auditing, mandate, aims, and types of audit as well as its components and principles to be applied. ISSAIs 200, 300, and 400 expand on key areas of the auditing of public sector financial, performance and compliance statements by specifically adapting the general principles of ISSAI 100.
- Level 4 (ISSAI 1000–5999) involves more detailed guidelines than the Fundamental Principles and so can be used on a daily basis during an audit. This level includes both general financial, performance and compliance audit guidelines (ISSAI 1000–4999) and specific ones (ISSAI 5000–5999).

Financial audit guidelines are made up of 38 ISSAIs (ISSAI 1000–2999). The first two contain a general introduction to the guidelines (ISSAI 1000) and a glossary of terms to help

**Auditing, Table 1** International SAIs standards

| Level | ISSAI | Designation | Approval date |
|---|---|---|---|
| Founding principles | | | |
| **1** | 1 | The Lima Declaration | 1977 |
| Prerequisites for the functioning of SAIs | | | |
| **2** | 10 | Mexico Declaration on SAI Independence | 2007 |
| | 11 | INTOSAI Guidelines and Good Practices Related to SAI Independence | 2007 |
| | 12 | Value and Benefits of SAIs - making a difference to the life of citizens | 2013 |
| | 20 | Principles of Transparency and Accountability | 2010 |
| | 21 | Principles of Transparency and Accountability. Good Practices | 2010 |
| | 30 | Code of Ethics | 1998 |
| | 40 | Quality Control for SAIs. Implementation guidance and tools | 2010 |
| Fundamental auditing principles | | | |
| **3** | 100 | Fundamental Principles of Public-Sector Auditing | 2013 |
| | 200 | Fundamental Principles of Financial Auditing | 2013 |
| | 300 | Fundamental Principles of Performance Auditing | 2013 |
| | 400 | Fundamental Principles of Compliance Auditing | 2013 |
| Auditing guidelines | | | |
| **4** | Auditing guidelines | | |
| | 1000–2999 | General Auditing Guidelines on Financial Audit | 2007–2010 |
| | 3000–3999 | General Auditing Guidelines on Performance Audit | 2004–2010 |
| | 4000–4999 | General Auditing Guidelines on Compliance Audit | 2010 |
| | Guidelines on specific subjects | | |
| | 5000–5099 | Guidelines on International Institutions | 2004 |
| | 5100–5199 | Guidelines on Environmental Audit | 1998 |
| | 5200–5299 | Guidelines on Privatisation | 1998–2007 |
| | 5300–5399 | Guidelines on IT-audit | 1995 |
| | 5400–5499 | Guidelines on Audit of Public Debt | 2007–2010 |
| | 5500–5599 | Guidelines on Audit of Disaster-related Aid | 2013 |
| | 5600–5699 | Guidelines on Peer Reviews | 2010 |
| | 5700–5799 | Guidelines on Audit of Corruption Prevention | Ongoing |
| | 5800–5899 | Guidelines on Cooperative Audit between SAIs | Ongoing |

Source: http://www.issai.org

understanding and interpretation of the standards (ISSAI 1003). The other 36 ISSAIs (1200–1810) originate in an ISA, and therefore the last 3 ISSAI number digits are the same as the ISA number; for example, ISSAI 1300 (Planning an Audit on Financial Statements) and ISA 300 of the same name. Every financial audit guideline has its corresponding ISA and a practice note specific to the public sector, which orients ISA application to the public sector and should be read together with the ISA.

All practice notes are structured in the same way – background, applicability of the ISA to public sector auditing and additional guidance on public sector issues – and their paragraphs are numbered consecutively. To differentiate them from ISAs, paragraph numbers start with the letter P.

The performance audit guidelines (ISSAI 3000–3999) deal with audits whose aim is to monitor the efficiency and effectiveness of the administration's activities, programs or institutions, focusing in particular on finances and areas open to improvement. Two guidelines (ISSAI 3000 and 3001) describe features and principles of performance audits, serve as a basis for good practice and establish a methodological and professional framework which provides

auditors with standards and orientation in order to plan and carry out audits and report their results. The guidelines, however, are not intended to be applicable to all performance audits, given the diversity of SAIs in terms of mandate, scope, organization and methods; neither do they encompass every approach, technique and method used over the whole range of issues and perspectives in the public sector.

Compliance audit guidelines (ISSAI 4000–4999) deal with audits whose purpose is to check whether public sector institutional activities are undertaken in accordance with the laws, regulations and standards they are bound by. These guidelines cover all levels of the civil service – central, regional and local – and may be applied also to audits of private organizations which take part in the management of public goods or services, for instance as recipients of state aid or subsidies. ISSAI 4000 is a general introduction which describes its scope of application, how a compliance audit should be carried out according to a particular SAI's mandate and also how it is linked to other auditing standards. ISSAI 4100 deals with compliance audits which are carried out separately from financial ones, such as an independent or performance audit. ISSAI 4200 analyzes compliance audits carried out in conjunction with financial ones.

Most SAIs in the EUROSAI regard ISSAIs as highly relevant, especially those at levels 1, 2, and 3, the same being true for the general guidelines at level 4. Most EUROSAI members are familiar with the ISSAI framework, but application is not uniform. Some SAIs are required by law to use ISSAIs while others either apply the full set of standards or part of the regulatory framework or they use ISSAIs as a basis for their own auditing standards and guidelines (Engels 2012).

Specific guidelines aim to empower SAIs so that they can carry out audits of international institutions, environmental audits and audits related to privatizations, information technologies, public debt, disaster related aid, peer reviews or corruption prevention. Every guideline has a different structure and content, but they all attempt to help auditors to understand the nature of audits, to identify procedures and methodologies, to facilitate orientation and good practice, or to put forward assessment concepts and indicators, among other questions.

The INTOSAI also draws up, together with the ISSAIs, the INTOSAI GOV. They are a set of principles and pronouncements whose aim is to define a solid reference framework in matters of internal control and accounting standards for governments, institutions and auditors in particular and for the international community in general. The purpose of these guidelines is the fostering of good governance in the public sector.

### Institute of Internal Auditors

The internal auditing profession is governed by the International Professional Practices Framework (IPPF), which was drawn up by the IIA. The framework is made up of two types of professional guidance – mandatory guidance and strongly recommended guidance (see Fig. 2). Mandatory guidance is comprised of the Definition of Internal Auditing, the Code of Ethics and the International Standards for the Professional Practice of Internal Auditing. Strongly Recommended Guidance includes Position Papers, Practice Advisories and Practice Guides.

- Definition of Internal Auditing. Establishes the purpose, nature and scope of internal auditing (IIA 2013):

  > Internal auditing is an independent, objective assurance and consulting activity designed to add value and improve an organization's operations. It helps an organization accomplish its objectives by bringing a systematic, disciplined approach to evaluate and improve the effectiveness of risk management, control, and governance processes.

- *Code of Ethics*. Develops the definition of internal auditing as it establishes the principles (integrity, objectivity, confidentiality and competence) and the rules which govern individual and organization behavior in the performance of internal audits.
- *International Standards*. These must be complied with and applied internationally by individual internal auditors and when carrying out internal audit activities. They involve a statement of basic requirements for internal audits

**Auditing, Fig. 2** International professional practices framework. (Source: IIA 2013)

and for assessing their effectiveness and also interpretations which clarify terms or concepts used in statements. There are three types of standards: attribute standards, which deal with the features of the organizations and people providing internal audit services; performance standards, which describe the nature of internal audit services and also provide quality criteria for carrying out these services; and implementation standards, which expand on the other standards and determine what requirements are applicable to assurance or consulting activities.

Finally the IIA drafts strongly recommended guidance which help internal auditors to deal with issues linked to fraud, independence, objectivity, IT and quality assurance (Positions Papers). They also advise on the application of mandatory guidance (Practice Advisories) and orient auditors with detailed information on procedures, tools, programs and samples of audit reports (Practice Guides).

## Auditing Standardization at a European Level

In Europe, the EU fosters the application of international auditing standards given that governments of its member states are required to bear them in mind when carrying out monitoring procedures of EU finances (Miaja 2013). Article 28 of the delegated regulation (UE) 480/2014 of the Commission (3 March 2014), which complements regulation (UE) 1303/2013 of the European Parliament and Council, recognizes ISAs, ISSAIs and IIA as generally accepted international auditing standards.

Similarly, the ECA and the IAS of the European Commission do not draft public auditing standards but they do promote direct application of the above-mentioned standards.

The ECA undertakes audits in accordance with ISSAIs. However, it also avails itself of a set of guidelines and auditing manuals which include detailed information about how to carry out financial, compliance and performance audits.

The ECA guidelines are auditing methods aimed at providing support to auditors during different phases of an audit. ECA has published 10 guidelines, some of which may be applied to all TCE audits (guidelines on audit interview, data collection, surveys and report-collection) and others solely to performance audits (guidelines on issue analysis and drawing conclusions, developing audit objectives and evaluation, risk assessment).

The auditing manuals establish principles of international auditing standards and provide orientation and instructions about how to apply the principles to both the ECA's annual declaration of

trustworthiness and to financial, compliance and performance audits. They also include a glossary of terms and acronyms.

As for the IAS, it works according to the Institute of Internal Auditors' International Professional Standards and Code of Ethics.

### Auditing Standardization at National, Regional and Local Levels

In the area of external audit, SAIs and RAIs are responsible for public sector audit. In some countries, external private firms audit certain public bodies, for instance local government financial audits in Sweden and Belgium, special funds in Cyprus, or universities, private schools, and high schools in Denmark (Ernst & Young 2012). Also, in Finland, authorized public accountants undertake financial audits of some local government departments.

Generally speaking, SAIs and RAIs apply internationally accepted auditing standards by adapting them to their own regulations. Internationally accepted auditing standards mean ISAs issued by the IAASB of the IFAC, and the ISSAIs approved by the Professional Standards Committee of the International Organization of SAIs.

Most European countries use ISAs and ISSAIs, or very similar standards, when they carry out public sector financial audits that tend to take place annually (Ernst & Young 2012). In Austria, France, Germany, Italy and Spain, regions have autonomy to regulate audits (Brusca et al. 2015).

The standard reference framework which is followed for conducting compliance audits is made up of ISSAIs (400 and 4000–4200) and the Financial Compliance and Audit Manual of the ECA. Some countries like the Netherlands and the United Kingdom have their own specific guidelines as well. Compliance audits are a key element in public sector transparency and accountability, which is why they are carried out in all countries without exception (FEE 2015a).

Performance audits are carried out in all European countries except Greece. They have a long tradition in Nordic countries (Denmark, Finland, Norway and Sweden) and in the Netherlands, the United Kingdom, Belgium, Italy, France, Portugal and Slovenia (FEE 2015b). SAIs and RAIs have drawn up specific guidelines for this type of audit, which are used in conjunction with the INTOSAI ISSAIs 3000 and 3100.

Internal audits are carried out in the public sector by most EU countries and they do so through audit boards, audit committees, internal audit services, top managers/top officials and internal auditors. However, they do not cover every part of the sector and nor do they deal with each part in the same way. The degree of internal auditing varies, as does the type of audits regularly undertaken (EU 2014).

Most member countries base their internal auditing systems on the IIA regulations, although some differences can be observed in terms of the extent to which they are applied. Some countries, such as Slovenia, apply the IPPF fully, others apply the mandatory guidelines (Estonia, Ireland), while others only apply the standards (Austria, Belgium, the Czech Republic, France, Hungary, Poland, Romania, Slovakia) or the code of ethics (The Netherlands) (EU 2014). Finally, countries like Bulgaria, Croatia, Greece, Italy, Latvia, Spain, Sweden and the United Kingdom have their own regulations governing internal auditing, which tend to be in line with IIA standards (EU 2014).

## Conclusion

Auditing activity in the public sector should be a response to social demand for good government. Public auditing should have an impact on verification of compliance responsibility by managers and on how they explain their management through their statements of accounts (García 2005).

For this purpose, different types of audit, compliance, financial, and performance audits, are performed by individuals or institutions which follow generally accepted auditing principles and standards.

Regional, economic, social and political diversity among European countries have given rise to different control models and different entities in both the internal and external auditing areas. EU countries carry out internal audits through audit

boards, audit committees, internal audit services, top managers/top officials and internal auditors, while external ones are performed by SAIs, RAIs, external private firms or private auditors.

This diversity, however, does not mean that public auditing is carried out in noticeably different ways, and this is where audit standardization at an international level has become a key factor. The IFAC, INTOSAI and IIA, through the ISAs, ISSAIs and the IPPF are developing a regulatory framework which will allow the standardization of general auditing principles and those related to the development of audit work in all countries.

There are other organizations which take part in the standardization process at European and national levels: EUROSAI, EURORAI, ECIIA and national institutes of internal auditing. Also, the EU, the ECA and the IAS all promote the application of this framework because, on the one hand, the EU requires its use when central governments are auditing EU funds, and on the other, because the ECA and the IAS are already applying it to the audits they carry out.

To sum up, over the last decade Europe has made a major effort in matters of financial control, laying the foundations for the application of standards which are as uniform as possible. Nevertheless, public sector auditing over the next few years will have to face major challenges in a complex context of increasing demand for public services, demographic pressure and budgetary cutbacks brought about as a result of austerity measures.

## Synonyms

Auditing for financial reporting = Financial statement audit in the public sector (for the purpose of this entry)

## Definition

The term "audit" possibly originates from the Latin "audire," meaning "to listen". In the ancient Rome practice, one official would compare records with another for a separation of duties and verification. Later this practice expanded to England that confirmed a quotation from Shakespeare's piece:

> If you suspect my husbandry or falsehood,
> Call me before the exactest auditors
> And set me on the proof. (W. Shakespeare 1623)

Auditing: "A systematic process of objectively obtaining and evaluating evidence regarding assertions about economic actions and events to ascertain the degree of correspondence between those assertions and established criteria and communicating the results to interested users." (Hyytinen and Kallunki 2014).

Government auditing: is essential to the government's responsibility of accountability to the public. Government audits are intended to provide an independent, objective, nonpartisan assessment of the stewardship, performance, and cost of government policies, programs, and operations (GAO-06-729G Government Auditing Standards, 1.01, 1.02).

Most often the government auditing is divided into financial statement audits and performance audits. So we can see that financial statement audit is a part of government auditing.

Financial statement audit in the public sector: an assessment of the public sector organizations' financial position and results of its operations, as a rule for the whole fiscal year. The primary purpose of a financial statement audit is to provide an opinion (or disclaim an opinion) about whether an entity's financial statements are presented fairly in all material respects in conformity with generally accepted accounting principles (GAO-06-729G Government Auditing Standards, 1.25).

The term "**financial statements**" refers to a presentation of financial data, including accompanying notes, derived from accounting records and intended to communicate an entity's economic resources or obligations at a point in time or the changes for a period of time in conformity with an

identifiable framework, such as generally accepted accounting principles (GAAP) or another comprehensive basis of accounting (GAO-03-673G). **Financial statements** are a structured representation of the financial position and financial performance of an entity (IPSAS 2015. 1, 15).

**Fiscal year** is a period used for calculating annual ("yearly") *financial statements*.

All of definitions are considered for the public sector.

## Introduction

Nowadays, with globalization of the economy, good governance of public finance is of fundamental importance for all countries to ensure the sustainability of the national budget and financial systems, as well as mutual financial security and sustainable economic growth. The public sector of many economies has been subject to dramatic change.

Accounting is a major mechanism by which many of these changes have been enacted. Effective budget implementation is an important factor in influencing the volume and quality of public services. Furthermore, it is important to bear in mind that leakage of resources through poor accounting directly threatens fiscal stability since it requires more resources than should be necessary to achieve any given result. Government auditing provides independent assessments of that information for the benefit of those charged with oversight and for the public. When public are confident that the information they receive is relevant, reliable, understandable, consistent, and comparable, it creates trust.

Transparency and public accountability further engender trust in a representative democracy. Working together, these factors lead to greater citizen satisfaction and better access to capital at a lower cost. As long as budget resources come from the public in the form of taxes, every citizen demands greater understanding of where their tax money goes and how it is spent and control.

Financial statement audit as part of *governmental auditing* will focus attention on how budget resources are spent. Assessment procedures of financial auditing serve to avoid misrepresentation and fraud in public sector financial statements. Since the public sector financial statements are placed on the Internet, any citizen can get acquainted with this reporting. And citizens can trust the information set in these financial statements if it is verified by auditors properly. Auditors should assess fair presentation of public sector financial statements. When financial statements "furnished by a state agency are in fact reliable, citizens' trust should be increased by auditors. When, on the other hand the information is significantly unreliable, auditors should reveal that and consequently decrease citizens' trust" (Budding and Grossi 2014, p. 146).

On the other hand, "fair presentation is not equivalent to financial health (i.e., a good picture is not necessarily a pretty picture). . .Yet there is no inconsistency between a government receiving an unqualified opinion on the fairness of its financial statements and that same government experiencing financial difficulties. The financial statement audit is designed to vouch for the reliability of the financial statements, not the soundness of the finances they portray. Just as the image of something unattractive in a photograph is no indication of a defective camera, a poor financial condition is in no way inconsistent with fair financial statement presentation" (Gauthier 2009). Indeed, the quality of financial reports also depends on the indicators used to present them.

## Financial Statement Audit in the Public Sector

First of all, it is necessary to know the structure of the public sector. The most common public sector comprises general government and public corporations. Government-owned enterprises, such as the central bank, post office, or railroad are often referred to public corporations. General government usually consists of three levels: central government, state or regional government, and local government. Public corporations are divided on nonfinancial (e.g., post office) and financial (e.g., central bank).

To understand the essence of financial statement audit, it is necessary to define its subject and object. The subject is the audit institution and the object is the auditee.

**The subject** depends on the public sector level.

At the central government level, financial statements are audited by federal government or parliamentary bodies like Government Accountability Office (GAO), Supreme Audit Institutions (SAI), federal financial control bodies, treasury, Accounts Chambers, etc.

At the state/regional government level, financial statements auditing (control) is conducted by regional branches of federal financial control bodies, state Accounts Chambers, regional Account Chamber.

At the local government level, financial statements auditing (control) is conducted by local parliamentary bodies like local Accounts Chambers and some of central and state governments body in sharing functions.

**The object** is auditee – public sector entities belonging to the public sector that present financial statements. Financial statements of an entire country presented to the International Monetary Fund (IMF) are prepared and approved by the member country's Ministry of Finance in accordance with Government Financial Statistics Manual (GFSM 2014). All 188 IMF member countries (including European countries) must comply with GFSM 2014 and ESA 2010.

Inside any country, financial (including budgetary) statements of each separate public sector (budgetary) entity are prepared by accountants and approved by the head of this organization. Many regulations (e.g., budget code) and rules are usually ordered by the Ministry of Finance and spread inside the country. The financial statements of each budgetary entity presented depend on the level of budget system of this country. For instance, federal level budgetary entity presented their financial statements to the federal authority, etc. Many countries use IPSAS to accomplish this. Subsequently, financial statements are consolidated on each level of the budget system and then for whole country.

To conduct financial statement audit in the public sector, auditors must know public sector accounting standards (e.g., GAGAS, IPSAS), rules, laws, and regulations for preparing financial statements, as well as auditing standards (e.g., INTOSAI, SAS, ISA, PCAOB), rules, laws, and regulations for writing auditor's reports. Because "the auditor's report is the most important product of the audit. The auditor's report is normally directed to parliament and the cabinet. It is thereby often made available to citizens." (Budding and Grossi 2014, p. 155). The report should include all significant instances of noncompliance and abuse and all indications or instances of illegal acts that could result in criminal prosecution that were found during or in connection with the audit (GAO/OP-4.1.2, p. 40).

When giving the auditor's report, auditors must be sure that financial statements are complete, reliable, accurate, consistent, and timely. In addition to law, "the rules and regulations specifically relevant to audit in the public sector can be presented in four categories: the Lima declaration, the Code of Ethics, auditing standards and practice notes" (Budding and Grossi 2014, p. 151).

In order to carry out financial statements audit, it is necessary to perform two main procedures: ***(1) verification of financial statements compliance to laws and regulations and (2) analysis of financial statements elements***.

### Verification of Financial Statements Compliance to Laws and Regulations

When checking the correctness of *financial statements*, one should determine (Antipova 2014):

1. The guidance of international and domestic accounting rules. A simplified block diagram of generalized audit procedures for compliance with the existing legal framework is shown in Fig. 1.
2. Completeness and timeliness of reporting. Completeness means that all requirement statements (see Table 1) are presented.

The composition of public sector financial reporting is established in international regulations such as GFS, IPSAS, and others. A comparison of the required forms for reporting is shown in Table 1.

**Auditing for Financial Reporting, Fig. 1** Block scheme of financial statements control procedures

**Auditing for Financial Reporting, Table 1** The required forms for reporting

| GFSM (2014) | IPSAS (2015), 1, 2, 24 |
|---|---|
| Statement of operations | A statement of financial performance |
| Statement of other economic flows | – |
| Balance sheet | A statement of financial position |
| Statement of sources and uses of cash | A cash flow statement |
| Statement of total changes in net worth | A statement of changes in net assets/equity |
| Summary statement of explicit Contingent liabilities and net Implicit obligations for future Social security benefits | Notes, comprising a summary of significant accounting policies and other explanatory notes |

Timeliness depends on the end of the reporting period. Usually financial statements must follow a strictly defined deadline, for example, in 20 days after the end of the reporting period or fiscal year. In addition, according to the budgetary rules, all transactions of public sector entities must fit into the fiscal year (see Table 2). Usually audit bodies prefer to check financial statements for whole fiscal year because it is clearly seen how to execute year budget. That is all of budget money that was received by budgetary entity must be spent during fiscal year and this spending must be reflected in financial statements.

As shown in Table 2, different countries have fiscal years which end in different dates, complicating data comparability by comparing statements between those countries.

3. Whether all transactions with budget funds are accounted for the fiscal year.
4. The availability of authentic primary documents, timeliness, and accuracy of recording reflected into the accounts.
5. Whether the total amount on the accounts equal the sum in their detailed transcript.
6. Compliance with the instructions of the Ministry of Finance on the accounting and registers.
7. Compliance with established procedure for correcting errors in primary documents

received by the accounting department in the accounting records, as well as printouts.

8. Whether considered the results of previous audits of accounting and reporting.

### Analysis of Financial Statements Elements

During a financial audit, key financial elements, such as assets, liabilities, revenue, and expenses, are analyzed and checked. These elements are reflected mostly in two main statements: the balance sheet and the statement of operations. Let's look at the essence of these statements' elements.

A **balance sheet** is a statement of the values of the stock positions of assets owned and of the liabilities owed by an institutional unit or group of units, drawn up in respect to a particular point in time (GSFM 2014, 3.56). In accordance with **a double-entry system**, each transaction gives rise to at least two equal-value entries, traditionally referred to as a credit entry and a debit entry (GSFM 2014, **3.54**). In other words, balance sheets consist of a left side which reflects all assets' leftover and right side which reflects all liabilities' leftover.

**Auditing for Financial Reporting, Table 2** Fiscal year duration's in some countries

| Country | Beginning of fiscal year | End of fiscal year |
|---|---|---|
| Canada, Norway, Sweden | 1st July | 30th June |
| Most Continental European countries | 1st January | 31st December |
| Russian Federation and post-Soviet Countries | 1st January | 31st December |
| Turkey | 1st March | 28th February |
| United Kingdom, Japan | 1st April | 31st March |
| USA | 1st October | 30th September |

**Asset** is a store of value representing a benefit or series of benefits accruing to the economic owner by holding or using the resource over a period of time. It is a means of carrying forward value from one reporting period to another (GFSM 2014, **3.42**). **Assets** are resources controlled by an entity as a result of past events and from which future economic benefits or service potential are expected to flow to the entity (IPSAS 2015 1, 7).

**Liability** is established when one unit (the debtor) is obliged, under specific circumstances, to provide funds or other resources to another unit (the creditor) (GSFM 2014, **3.45**). **Liabilities** are present obligations of the entity arising from past events, the settlement of which is expected to result in an outflow from the entity of resources embodying economic benefits or service potential (IPSAS 2015. 1, 7).

As net worth equals assets minus liabilities, it is the balancer of the balance sheet. If the difference between the sum of assets and liabilities is positive (assets > liabilities), net worth is added to liabilities to the balance as shown on Fig. 2. Thence assets = liabilities + net worth.

If liabilities > assets, net worth will be moved to the left side and balance assets. Therefore it will be assets + net worth = liabilities. The left side total must always equal right side total in the balance sheet due to the double-entry system.

Since the *net worth* equals assets minus liabilities, it becomes necessary to check the assets and liabilities during balance sheet control to perform financial statement auditing.

So in the balance sheet (also designed "statement of financial position") auditing must

**Auditing for Financial Reporting, Fig. 2** Balance between main balance sheet elements

control two main elements: assets and liabilities. Assets are classified differently depending on the regulations. General rules for determining the regulated assets are GFSM (2014) and IPSAS (2015).

When controlling the elements of the balance sheet, auditors need to ensure:

1. The accuracy and completeness of elements provided in the forms of reporting, and the coordination of related elements presented in separate forms and the balance.
2. Compliance with the actual performance on the reporting date (end of the financial year).
3. That all assets and liabilities actually existed at the reporting date; in case of doubt an inventory should be conducted.
4. Whether the same analytical and synthetic accounting data. If any discrepancies exist, the deviation in each account should be calculated. The magnitude of the deviation should note as the amount of financial statementsâ€™ distortion.
5. The correctness of the assets' and liabilities' amount.
6. Controlling of the operation with different debtors and creditors. To do this, auditors must check the reasons for the formation of receivables and payables; the terms of the debt of each debtor and creditor, the reality of receivables and payables.

**The *statement of operations*** presents details of transactions in revenue and expense. Revenue minus expense equals the *net operating balance*, reflecting the total change in net worth due to transactions with financial assets and liabilities (GSFM 2014, 4.16, 4.17). Since the *net operating balance* equals revenue minus expense, it becomes necessary to control the revenue and expense during financial statement audit.

Any of budget revenues can be classified as all proceeds from transactions that result in an increase in the value of assets. But the detailed classification of revenue for operations statement purposes is significantly different depending on the regulations ordered by Ministry of Finance from country to country. So compliance factual revenue with classification needs to be controlled in the audit.

First of all, control starts with checking the completeness and correctness of the reported amounts of revenues and expenses. **Revenue** is an increase in net worth resulting from a transaction (GSFM 2014, 4.23). **Revenue** is the gross inflow of economic benefits or service potential during the reporting period when those inflows result in an increase in net assets/equity, other than increases relating to contributions from owners (IPSAS 2015 1, 7). **Expense** is a decrease in net worth resulting from a transaction (GSFM 2014, 4.24). **Expenses** are decreases in economic benefits or service potential during the reporting period in the form of outflows or consumption of assets or incurrence of liabilities that result in decreases in net assets/equity, other than those relating to distributions to owners (IPSAS 2015 1, 7).

A key point when checking revenue and expense is the recording bases because the amount of revenue and expense depend on applicable recording bases. Broadly, the time of recording could be determined on **four bases**: the accrual basis, the commitments basis, the due-for-payment basis, and the cash basis. In practice though, many variations on these bases of recording may exist (GSFM 2014, **3.61**).

According to GSFM (2014) and IPSAS, the accrual basis is a preferable recording base for financial accounting. But the result of research of 14 European countries shows that "out of 14 countries covered, five use cash, four apply modified cash, two use modified accrual, while there are only three countries using full accruals for budgeting purposes (Austria, Switzerland and the United Kingdom)" (Brusca et al. 2015, p. 236).

In the course of checking **revenue**, the auditor pays particular attention to:

- The completeness and correctness of recording and reporting all revenue.
- A contract between the government/state and the contractor, the definition of contractual compliance with applicable laws.
- The presence of an integral part of the contract between the customer (the state) and the performer – budget programs and activities

justifying the targeted use of budgetary funds; special attention in the implementation of this complex work should be focused on coming budgetary allocations to finance capital (current assets) and operating costs.
– The nature of the receipt of funds – if the entity is a budgetary entity or state budget funds, the budget comes to exercise their statutory activities within the estimates of revenues and expenses.

If the budget comes in the form of grants, subsidies, and other transfers, it is necessary to examine the contract for their provision; especially attentively one must check the performance of all the essential conditions of the contract.

The main thing in this block is the control over the use of finance, which should confirm the reasonable assertion that the budget users achieve the goals set in their outcome.

To check **expense**, the auditor performs the following procedures:

1. Check the distribution of the sum of debit turnover of the account "expenses," taking into account the formation of the cost of the transaction log.
2. Check the completeness, accuracy, and timeliness of the entries in the transaction logs.
3. Verify the resulting amount of expenses of primary documents with a total transaction log on the account "expenses" for a month, and then – with a total of the general ledger for each month and a whole year. Then compare the results of the general ledger with a total cost in the statement of operations.
4. In the event of discrepancies in the amounts of analytical and synthetic accounting, find out the cause.
5. Pay attention to the procurement procedure because it is known that during public procurement some officials have enriched.
6. Control for whether government activities are operating in accordance with the principles of economy, efficiency, and effectiveness.
7. Control of social spending.

A financial statement audit should be led to ensure the issuance of reliable financial information and to deter fraud, waste, abuse, and others violations of public resources. The most common violations in the public sector are: abuse, fraud, waste, bribery, and kickbacks. However, unfortunately these kinds of violations are really difficult to reveal, because such violations very often do not have documentary proof and are made as a result of face-to-face agreements in cash (black) or virtual money, and so are not reflected in the financial statement. This is caused by the appearance and prosperity of the shadow economy, and some senior officials became oligarchs due to these nonrevealed and nonidentified violations.

## Conclusion

Now seems like an opportune time to improve financial statements auditing that is dealing with some major headwinds across a variety of fronts. Many types of crisis, government failures, bureaucratizing, and budget troubles called for a new innovative approach to financial statements auditing around the world. Financial statement auditing needs to rethink its priorities, put transparent decision-making, simpler legislation, make better methodology, and simplify the rules it uses to define and measure auditing results. The improvement of the financial statement auditing in the public sector has two sides: how to further improve the financial reporting process and how to further improve the financial auditing.

In considering how to further improve the public sector financial reporting process in their countries, researchers thought that the following measures were a high priority (IFAC 2008, p. 21):

- Continue convergence to one global set of financial reporting standards
- Globally unify, simplify, and clarify financial reporting standards focusing more on the best practice
- Ensure that boards of directors pay attention to the quality of financial reports
- Provide additional education and training for preparers.

The priorities to further improve the financial statement auditing in the public sector were (IFAC 2008, p. 26):

- Continue to focus on independence, objectivity, and integrity
- Converge to one set of global, principles-based auditing standards over time
- Ensure consistent use of audit standards and safeguarding of quality within auditing bodies
- Improve the auditor's communication, both internally and externally
- Raise the auditor's competence and professionalism
- Consider limited/proportionate liability for auditors

Currently, no more than 60% of budget organizations and operations with budgetary funds are object to the government audit. The existence of the shadow economy and an impressive amount of violations indicate that many financial transactions with budget money go out of control. We need a transition to a fuller control of the budget organization and operations with budgetary funds. This can help a new approach to financial statements auditing – digital auditing.

Moving auditors to new and evolving techniques will modernize financial statement auditing by making full use of current and emerging technologies to overhaul traditional sampling-based auditing approaches and fully leverage technology to digital auditing. Digital auditing allows leveraging sophisticated tools, such as online analytical processing to analyze large populations of both manual and automated journal entries from the financial management system. Getting there will take dedicated investments, concerted effort, executive-level commitment, and strong partnerships with agency management, who will likewise greatly benefit from this evolution. In doing so, it will enable the auditor's profession to move into the future and add even greater value to managing the cost of government and providing the highest levels of accountability and transparency to the public (Lewis et al. 2014, p. 34).

In addition, it is necessary to note that "many auditors want further hands-on guidance to be included in the standards" (Budding and Grossi 2014, p. 159). Despite the fact that auditors have many types of instructions, there are still not enough really workable, clear, and easy manuals for beginners and students.

## Auditing Principles

Marco Bisogno
Department of Management & Innovation Systems, University of Salerno, Salerno, Italy

### Synonyms

Principles of auditing

### Definition

Auditing is a complex and iterative process, based on several principles. Taking into account that there are different types of audits (compliance, financial, and performance audit) in the public sector context, the aim of these principles is to allow auditors to objectively determine if information or actual conditions conform to predetermined criteria.

### Introduction

Generally, auditing is the process by which auditors provide an independent assurance on the ability of financial statements to give a true and fair view of the economic and financial performance of an entity. In a more general sense, auditing refers to any form of review of systems, processes, or outputs concerning an audited body.

However, in the public sector realm, this general concept needs further specifications. Public sector entities have to provide services to citizens, who pay taxes; this means that elected members and the governing bodies have to provide information about the proper use of resources received, pursuing the objectives of openness, accountability, and integrity. In this way, public sector auditing plays an important role; in fact, it provides legislative bodies as well as entities charged with governance and the general public with both information and independent assessments concerning the stewardship and performance of government policies, programs, and operations. Accordingly, public sector auditing can be considered as a systematic process by which an audit institution is able to objectively determine if information or actual conditions conform to predetermined criteria.

Public sector auditing is carried out by organizations on different governmental levels, such as supreme audit institutions (SAIs) at the national level and local audit institutions at the regional as well as municipal levels. Generally, the SAI, namely, an auditor general office, is in charge of both internal and external audits; in order to guarantee its independence, the SAI is appointed by Parliament. In some European countries, this general office (named *Court de Comptes* in France, *Rechnungshof* in Germany, and *Corte dei Conti* in Italy) has a judicial power in public sector financial law. This jurisdictional function implies that the SAI has to guarantee that any public sector entity managing public funds is held accountable.

At a municipal level, external auditors, who have to communicate their findings to the SAI, also carry out public sector auditing. Their role is similar to that played by private sector entity auditors, since they provide an opinion on the fairness of budget and financial statements.

The SAIs can be considered as an important pillar of national democratic systems, emphasizing the principles of transparency, accountability, governance, and performance. More specifically, according to the International Standards of Supreme Audit Institutions 100 (ISSAI 100) issued by the INTOSAI (International Organisation of Supreme Audit Institutions), all public sector auditing contributes to good governance in several ways (ISSAI 100, no. 21):

- Providing independent, objective, and reliable information, conclusions, or opinions based on appropriate evidence relating to public sector entities
- Enhancing accountability and transparency, inspiring continuous improvement in the proper use of public funds as well as in the performance of public administrations
- Reinforcing the effectiveness of bodies that exercise general monitoring and corrective functions over government and those responsible for the management of publicly funded activities
- Creating incentives for change by providing knowledge, comprehensive analysis, and well-founded recommendations for improvement

## Types of Public Sector Auditing

Public sector auditing can be categorized into three basic types:

- Compliance audit (i.e., audits of compliance with authorities)
- Financial audit (i.e., audits of financial statements)
- Performance audit

*Compliance audit* (sometimes called "regulatory audit") aims to determine if a specific subject matter (such as activities, financial transactions, and information, depending on the scope of the audit) is in compliance with the authorities that govern the audited entity. These authorities may include laws, regulations, rules, budgetary resolutions, codes, and general principles that govern proper financial management as well as the conduct of public officials.

*Financial audit* aims to determine if financial information is presented in accordance with the applicable regulatory framework. The subject matter of financial audit is the financial statements of a public sector entity, more specifically the financial position, performance, cash flows, and other related elements recognized, measured, and presented in the financial statements. Auditors are expected to collect sufficient and appropriate evidence that enable them to express an opinion as to whether the financial information is free from material misstatement due to fraud or errors. Moreover, they have to point out whether financial statements are complete and presented in accordance with law and accounting standards (if they are adopted). According to Whittington and Pany (2003) and Bergmann (2009), a generic audit process of financial statements should include the following steps:

1. Planning of the audit as well as, if required, classification of scope and mandate
2. Evaluation of the internal control system of the audited entity
3. Collection of evidence about the financial statements' fairness
4. Proposal of adjustments
5. Follow-up on necessary changes
6. The issue of a report

Arguably, the third step is particularly delicate, due to the different level of confidence: actually, significant misperceptions would derive from a lack of coincidence between the adopted level of confidence upon which assurance is prepared and expectations of the intended users (i.e., legislative bodies or the general pubic to whom the audit report is addressed) regarding this level. Therefore, the International Audit and Assurance Standards Board (IAASB), in its conceptual framework for assurance engagement, provides a clear distinction between reasonable assurance and limited assurance:

- Reasonable assurance, which is high but not absolute, aims at a "reduction in assurance engagement risk to an acceptably low level in the circumstances of the engagement as the basis for a positive form of expression of the practitioner's conclusion" (IAASB (2005), par. 11). In this case, the auditor will express an opinion on the compliance of the subject matter with the relevant standards and the completeness of financial statements;
- Limited assurance aims at "a reduction in assurance engagement risk to a level that is

acceptable in the circumstances of the engagement, but where that risk is greater than for a reasonable assurance engagement, as the basis for a negative form of expression of the practitioner's conclusion" (IAASB 2005, par. 11). In this case, the opinion of the auditor intends to exclude some elements of risk, concluding that "based on the procedures performed, nothing has come to the auditor's attention to cause the auditor to believe that the subject matter is not in compliance with the applicable criteria" (ISSAI 100, par. 33).

*Performance audit* aims to assess if a subject matter is performing in accordance with the principles of economy, efficiency, and effectiveness, also pointing out if it can be improved. More specifically, according to Ng (2002) and Politt et al. (1999), performance audits focus on efficiency in using public resources, on effectiveness in conducting programs and projects, and on ability in using these resources in the most productive manner as well as in increasing performance of the public sector. Coherently, the mandate of audit institutions is to establish whether the subject matter has operated with due regard to economy, efficiency, effectiveness, and good management practices (Nutley et al. 2012; Pollitt et al. 1999). The subject matter of the auditing activities may be a public sector entity, a specific program or fund, a public policy or defined activities, evaluating their outputs, outcomes, impacts and, more generally, any financial as well as nonfinancial information concerning these elements. The main role of auditors consists in evaluating and measuring the subject matter, assessing the extent to which the established criteria have or have not been met, and providing recommendations aiming to remove ineffectiveness of public policies. Reports prepared by auditors, in most cases, are sent to Parliament.

A shift from financial auditing to performance auditing can be observed, due to the growing need to examine outputs and outcomes of public sector entities (Dwiputrianti 2011). The scope of auditing cannot focus only on financial aspects concerning how money was spent, but has to go further in order to pay attention on economy, efficiency, and effectiveness (Guthrie 1992). According to Jones and Pendlebury (2000), this wider definition of audit reflects the changes of the last decades in the way of defining public sector auditing, according to seminal concepts provided by the so-called Yellow Book (*Standards for Audit of Governmental Organisations*, *Programs*, *Activities and Functions*, issued by the US General Accounting Office (GAO 1998). More generally, it is worth to notice that performance audit is a very complex task and that it consists of a "value-for-money audit," which focus on entity's core activities, as well as on "audit of systems," which means concentrating on systems developed to manage those activities (Öhman 2015).

According to the literature, there is a trade-off between accountability and performance (enhanced accountability can diminish or impede organizational performance), since auditing would discourage innovation and ignore results if it leads to excessive caution (Reichborn-Kjennerud 2013). Therefore, scholars argue that auditors should modify their idea of accountability, aiming at emphasizing learning in the audited organizations. As a consequence, auditing plays an important role in contributing to learning and improvement, if it is oriented toward improved performance and results instead of a mere compliance with rules and regulations. In this way, the auditing reports on one hand provide audited entity to make changes and, on the other, improve and enhance accountability.

## Principles of Auditing

Auditing activities in the public sector should accomplish some fundamental principles. Generally, a hierarchy between these principles can be proposed, since there are some *general principles*, which auditors should follow prior to commencement and also during the process, and other *specific principles*, which affect the different steps of the iterative auditing process.

According to the ISSAI 100 (par. 34), these principles can be classified into three main categories:

(a) Principles related to the organizational requirements of the SAI
(b) General principles that the auditor should take into account both prior to commencement and during the auditing
(c) Principles related to specific steps concerning the auditing process

The first category of principles (*sub a*) concerns the organizational requirements, which means that the SAI has to define and constantly adopt procedures for both ethics and quality control. The aim is to guarantee that its personnel are complying with professional standards as well as the applicable ethical, legal, and regulatory requirements. ISSAI 30, *Code of Ethics*, provides guidance in this regard, emphasizing that each SAI has to guarantee that its auditors are made aware of these principles and act accordingly. On the same wavelength, ISSAI 40, *Quality Control for SAIs*, aims to assist SAIs to design a quality control system that is appropriate to their mandate, also responding to their quality risks.

The second category of principles (*sub b*) consists of the following general principles:

- *Ethics*. According to the abovementioned *Code of Ethics*, the SAI has to define ethical requirements to which its auditors have to comply with.
- *Independence*. This basic principle means that public sector auditors should carry out their delicate role freely, without interference of the audited entity. The quality of auditing activities is largely based on the independence of auditors and, in turn, the independence largely depends on the methods of appointment, which would assure that the designated auditors could report impartially. The auditors of SAI are directly appointed by Parliament and this should guarantee their independence. Similarly, the statute guarantees the independence of national auditing agencies.
- *Professional judgment, due care, and skepticism*. These principles refer to a general attitude of the auditors in forming decisions about the appropriate course of action. Professional judgment refers to knowledge, skills, and experience of the auditors, which have to be applied in forming their judgment and expressing their opinion. Due care means that the auditors should plan and perform audits in a careful and conscientious way, at the same time avoiding any conduct that might discredit their work. Professional skepticism means that auditors have to adopt an open-mind approach, maintaining a "professional distance and a questioning attitude" when they assess the appropriateness of the evidence collected during the auditing process.
- *Quality control*. This principle concerns the abovementioned quality control policies and procedures of the auditing process defined by the SAI, in order to guarantee that audits are performed at a consistently high level.
- *Audit team management and skills*. Each component of the audit team is expected to have all the necessary skills, knowledge, and expertise required by the auditing activities. More specifically, auditors should have suitable qualifications; have knowledge on laws, rules, and standards to be implemented; understand the operations of the audited entity; and possess practical experience. In some jurisdictions, SAI's auditors adopt the findings of internal auditors as well as of other (external) auditors; in such circumstances, on one hand SAI's auditors should take into account that objectives pursued by these different auditors are or should be different; on the other hand, this collaboration could improve transparency and accountability for the use of public resources, as well as economy, efficiency, and effectiveness in public administration.
- *Audit risk*. This basic principle means that the audit report could be inappropriate, providing wrong conclusions. Therefore, auditors should aim to reduce risk, even though they have to recognize limitations characterizing all auditing activities, which can never provide a total and absolute certainty about the condition of the subject matter. It is worth recalling again the distinction between reasonable assurance and limited assurance, since auditors in the first case should reduce audit risk to an acceptably low level (given the circumstances of the

audit), while in the second one they provide a level of assurance that, in their professional judgment, will be meaningful to the intended users.

- *Materiality.* The subject matter is considered material if the decisions of the intended users would be influenced by its knowledge. Determining materiality is not an easy task, depending on the interpretation and professional judgment of the auditors regarding the users' needs as well as on the context in which it occurs. Materiality may be expressed in both quantitative and qualitative ways, even though it is frequently expressed in terms of value.
- *Documentation*. Auditors should prepare audit documentation concerning both the auditing strategy and the auditing plan, providing detailed information on: (.) the nature, timing, scope, and results of the adopted procedures, (*ii*) the evidence obtained, and (*iii*) the audit conclusions achieved and the recommendations.
- *Communication*. This principle refers to the need of informing the management of the audited entity on all matters concerning the audit, providing them with timely observations and findings throughout the engagement. In a wider sense, auditors should communicate audit-related matters also to other stakeholders, such as legislative bodies.

The third category of principles (*sub c*) relates to the auditing process. According to ISSAI 100, this principle may be divided into three sub-principles:

- *Planning an audit*.

  This principle refers to the need of a complete planning of all the auditing activities. The first step concerns the definition of the terms of the audit, at the same time specifying the subject and the objectives of the audit, the access to the data, the auditing process, and the reports resulting at the end of it, as well as the roles and the responsibilities of all the involved parties. Subsequently, auditors should gain a proper understanding of the subject matter (entity, programs, or activities to be audited) through constant interactions with management and other relevant stakeholders. After an accurate assessment of the risk, according to the audit objectives, auditors should plan their work in order to ensure that auditing will be performed in an effective and efficient manner. This planning covers both strategic aspects (defining objectives and approach of auditing) and operational aspects (such as defining the nature, timing, and extent of the auditing procedures).
- *Conducting the audit*.

  This principle refers to the way of performing auditing activities, providing appropriate evidence in order to support auditors' final report. Evidence consists of any information (based on records of transactions, communication with third parties, observations by the auditors, etc.) gained through different methods (such as inspection, observation, inquiry, confirmation, and so on). Obviously, evidence should be sufficient, relevant, and reliable, in order to support the conclusions of the auditors, who have to determine if the subject matter has been audited in a sufficient and appropriate manner.
- *Reporting and follow-up*.

  This final principle concerns the preparation of the report where auditors express their opinion, communicating to all the interested parties their conclusions. The report should be clear, complete, and easy to understand, as well as objective and fair, avoiding ambiguity. Generally, the report may appear in a short or long form, with its content and form depending on the nature of the auditing, the intended users, and the legal requirements. The final auditors' opinion may be unmodified or modified.

  The unmodified opinion can be used in both limited and reasonable assurance.

According to ISSAI 100, par. 51, the modified opinion may be:

- *Qualified*, "where the auditor disagrees with (or is not able to achieve appropriate audit evidence about) some subject matter items that are, or could be, material but not pervasive"
- *Adverse*, "where the auditor, having obtained sufficient and appropriate audit evidence,

concludes that deviations or misstatements are both material and pervasive"
– *Disclaimed*, "where auditor is not able to gain sufficient and appropriate audit evidence due to an uncertainty or scope limitation which is both material and pervasive"

In the case of modified opinion, auditors should clearly explain the underlying reasons, focusing on the applicable criteria, the nature, as well as the extent of the modification; moreover, the report should include recommendations for corrective actions contemporarily highlighting any internal control deficiencies.

Finally, the SAI should monitor if matters raised in the auditing report have been addressed.

## Conclusions

Previous sections have summarized the main principles of public sector auditing; some of them express general and basic principles of all (private and public sector) auditing activities, such as the basic principles of independence and materiality.

Other principles seem to be specific to the public sector realm.

Firstly, public sector auditing has a wide scope; while private sector auditors are expected to provide an opinion on the ability of financial statements to present an accurate picture of the financial conditions and performance of a company, public sector auditors have a wider scope: their role is not limited to financial statements of the audited entity but also includes issues such as legality, probity, and value for money. It is worth recalling again that originally, external audits were considered as a tool to assess that the government's financial statements were a fair and accurate reflection of revenue collected and expenditures carried out (financial audit), and that agencies were managed in accordance with the law and regulations (compliance audit). In recent years, there has been a shift from financial to performance audit, since SAIs have to pay attention on value for money, evaluating performance of all public sector entities. However, it is worth noticing that performance audit:

- Is quite uncommon in the European context (Brusca et al. 2015, p. 247).
- Has been conducted within federal and state or provincial governments for years, while it is relatively new, or conducted rarely or not conducted at all in local governments, in both the United States and in Canada (Foster and O'Connor 2014, p. 12).

Secondly, public sector auditors play their role in the public interest, reporting their findings to the elected representatives and, in a broader sense, to the citizens who provide financial resources for funding the audited activities. Accordingly, pertinent reporting arrangements are required.

In this way, in the view of public interest, the conditions for accountability are improved, underlining the important role of auditors to support such a development (Cassel 2015).

Finally, it is worth considering that the auditing in the public sector offers a heterogeneous panorama (Brusca et al. 2015) especially on the types of auditing and the mechanisms involved in appointing auditors; however, even though many countries adopt standards developed by a governmental body, they generally take as a reference the International Auditing Standards of IFAC as well as the International Standards of Supreme Audit Institutions of INTOSAI, at the same time requesting the collaboration of these organizations.

# Authentic Leadership

Inmaculada Adarves-Yorno
University of Exeter, Exeter, UK

## Synonyms

Authenticity; Identity; Mindfulness; Self-awareness; Self-reflection

## Introduction

Imagine an institution in which the person on top is self-aware, listens to criticism, owns his/her mistakes, and does not blame others. In addition, that leader behaves congruently with his/her values and they "walk the talk and talk the walk." That is what a leader with high authenticity looks like.

In the past decade, there has been a great increase of interest in authentic leadership (Gardner et al. 2011), and indeed authenticity has become "the gold standard for leaders" (Ibarra 2015, p. 54). But there is no agreement around what it means to be an authentic leader. Shamir and Eilam (2005) posited four characteristics of authentic leaders: (1) they are true to themselves instead of conforming to the expectations of others; (2) they are motivated by personal convictions rather than being motivated by status and other extrinsic benefits; (3) they lead from their own point of view; and (4) the actions of authentic leaders are based on their personal values and convictions. In a similar vein, George (2003) suggests authentic leaders possess five key attributes: *purpose, values, heart, relationship*, and *self-discipline*. Avolio and colleagues (e.g., Avolio and Gardner 2005) argue that internalized moral perspective is a key component for authentic leadership.

To overcome the complexities of definition, an authentic leader is operationalized in this chapter as one who possesses authenticity (see later for more discussion of this definition). This chapter

will focus on describing some of the critical elements necessary to be an authentic leader and, in particular, delve into a key aspect which is essential to understand in order to fully comprehend and develop authenticity: self-awareness. In addition, it will introduce the concept of multiple identities and briefly present a leadership identity approach as it relates to successful authentic leadership. A discussion on how to develop authentic leaders as well as how to hire one will also be provided.

## Authentic Leaders

There are many well-documented benefits to both being and working with an authentic leader. First, for the leaders themselves, some of the benefits are better psychological wellbeing and contingent self-esteem are developed (Toor and Ofori 2009). Second, for their followers, authentic leaders both directly and indirectly elicit higher work engagement from followers and higher levels of organizational citizenship behaviors (Walumbwa et al. 2010), reduced follower burnout (Wong and Cummings 2009), higher trust in leadership (Clapp-Smith et al. 2009), and greater work engagement (Giallonardo et al. 2010). Finally, for organizational outcomes, authentic leaders have been found to enhance job performance (Walumbwa et al. 2008) and organizational commitment (Jensen and Luthans 2006).

Yet what is an authentic leader? As aforementioned, there are different conceptualizations of authentic leaders and leadership (for a review, see Gardner et al. 2011). Many of them emphasize the positive nature of the authentic leader with high moral values and positive characteristics such as confidence, hope, and optimism (e.g., Avolio et al. 2004). However, those definitions have been challenged as they do not necessarily fit with all leaders who possess authenticity (Ladkin and Taylor 2010; Wilson 2013; Shamir and Eilam 2005) and thus present a number of paradoxes (Adarves-Yorno 2013; Adarves-Yorno 2016). There is no space here to engage these caveats; therefore this chapter operationalizes an authentic leader as one who possesses authenticity.

Kernis and Goldman (2006) define authenticity as "the unimpeded operation of one's true or core self in one's daily enterprise" (p. 344). They outline and describe four dimensions of authenticity: (1) self-awareness, (2) unbiased processing, (3) authentic behavior, and (4) authentic orientation toward interpersonal relationships. *Self-awareness* refers to awareness of aspects of self, such as one's own personal characteristics, values, motives, feelings, and cognitions. *Unbiased processing* is characterized by an openness to evaluate desirable and undesirable self-aspects without denying, exaggerating, or ignoring knowledge and experiences. *Authentic behavior* means that people are transparent in their actions, and their behavior is rooted in inner factors instead of trying to gain external recognition or avoid rejection. *An authentic orientation toward interpersonal relationships* refers to an active process of self-disclosure, which leads to development of trust between people. That is, people share aspects of themselves such as thoughts and feelings when appropriate.

## Self-Awareness

Self-awareness is the basis for two of the elements required for authenticity, authentic behavior and authentic relationship orientation (Kernis and Goldman 2006), and thus is a pivotal component of authentic leadership (Gardner et al. 2005; Kernis and Goldman 2006). Self-awareness allows leaders to effectively draw on their experience and knowledge when making decisions (Crossan and Mazutis 2012). Furthermore, self-awareness allows leaders to understand how others affect them (Goldman Shuyler 2004). Kouzes and Posner (2012) posit that ultimately the success of a leader is dependent on the extent to which one is in tune with oneself. There are many different strategies that can be used to enhance self-awareness. It has been argued that for self-awareness, we need reflection and introspection (Walumbwa et al. 2008). Below is a

description of self-awareness processes which can be useful for leaders: self-reflection, mindfulness, and self-exploration in nature.

*Self-reflection* is widely used in leadership development. It is through reflection that a leader can *gain clarity* (Gardner et al. 2005). There are many different forms of reflection (for a review, see Raffo 2014). The main purposes of reflection are to make sense of experiences and to try to understand thoughts, emotions, behaviors, reactions, and patterns of being. In some cases, reflection is used to find coherence of thoughts, emotions, and behaviors (Rosenberg 2010).

*Mindfulness* is an area that has received exponential attention in the last decade. Currently there is a new model based on underlying neurocognitive mechanisms being developed which links mindfulness with authentic leadership (Venkatasubramanian and Dorjee 2011). Mindfulness refers to being aware of what is happening while it is happening in a nonjudgmental way (Kabat-Zinn 2003). Mindfulness research demonstrates clear benefits for the individual in terms of health and well-being as well as function and performance (for a review, see Good et al. 2016). In addition, the trait mindfulness of leaders has been positively associated with employees' job performance, job satisfaction, work-life balance, and citizenship behavior (Reb et al. 2015). These findings support the evidence cited above that authentic leaders elicit higher performance from employees.

Working with senior managers and leaders over the last 10 years has made something apparent: In most instances, the managers and leaders are so defined by their external role and their context that they are unable to engage with deeper forms of self-explorations. Therefore, many leaders allow little time for self-discovery, in spite of the key importance of self-awareness (George et al. 2007). To overcome these issues, leaders can engage in intensive but short forms of self-exploration that take place in a neutral and reenergizing context: nature. Having worked and evaluated a number of programs in nature over the last 5 years made something clear: nature-based programs can allow leaders to engage into deeper forms of self-exploration. There are a range of programs available to implement this ranging from a 2- to 3-day residential authentic leadership "retreat" to a vision quest.

## Multiple Identities and Authenticity

The previous sections fall within the statement that authenticity is understood as encompassing a *true self* (George et al. 2007), and it seeks to understand that *one* self. However, Wilson (2013) argues that there are multifaceted and often contradictory aspects of our "selves." Yet, multiple identities have, to date, been largely overlooked in the area of authentic leadership (Gardiner 2013). In fact, the common understanding of self-awareness refers to the knowing of "I," that is, being aware of our *individual sense of self*, habits, weaknesses, and strengths (i.e., personal identity). However, a robust perspective in psychology, the social identity approach (encompassing social identity theory (SIT; Tajfel and Turner 1979) and self-categorization theory (SCT; Turner et al. 1987)), argues and has demonstrated that our sense of self is composed of a personal identity (as aforementioned) and as many social identities as meaningful groups the individual belongs to. The application and understanding of multiple identities have been proliferous in leadership (Haslam et al. 2011). In the context of authentic leadership, the concept of multiple identities has been unpacked and its paradoxes exposed (Adarves-Yorno 2016).

## Becoming an Authentic Leader

Becoming an authentic leader is a personal lifelong journey which one must be willing to engage with fully. There are different paths that one can take to facilitate becoming an authentic leader (Adarves-Yorno 2013). But authentic leadership development should not be seen as a discreet program. Indeed, Avolio and Gardner (2005) notes that if anything, authentic leadership development should be labeled as a life's program. There are various strategies in lifelong journey that can be useful. In line with the chapter, the

ones noted below are mostly related to exploring their authenticity and self-awareness:

1. Following from Avolio (e.g., Avolio and Gardner 2005) and many other scholars in this field, it is essential to enhance levels of self-awareness. Self-awareness can focus on different aspects and layers of oneself. The leader can engage with questions such as "Who are you? What are your beliefs, convictions, and values? How do you react to others? What are your most prevalent emotions and thoughts?"
2. Following from George (2003), the leader needs to find out what he/she is passionate about and what his/her purpose is.
3. Although the question "who you want to become?" may be seen as straightforward by some, it is important to invite the leader to ask himself/herself why, at least three times, to question your responses. The answer to the last "why" needs to be aligned with the answer to the question (see Adarves-Yorno TEDx).
4. Boyatzis and Mckee (2005) in their book on resonant leadership note that is essential for the leaders to be aware of what sustains them and what drains them.
5. Following the social identity approach to leadership (Haslam et al. 2011), it is useful to investigate our social identities, when do they become active, and what impact do they have on us (see Adarves-Yorno 2016).
6. When engaging with all the questions above, it is important to consider the following mindfulness principles: curiosity, courage, compassion, and sense of humor.

## Authenticity and Leadership

Up to this point, the chapter has focused on the authentic leader, but to understand leader*ship*, it is critical to include followers in the equation. Successful leadership is a process of social influence that involves making *followers* want to contribute to shared goals (Steffens et al. 2014; House et al. 2001). Whereas it is true that authentic leadership is linked with a wide range of positive outcomes as aforementioned, it is critical to be aware of the social and contextual factors that impact upon a leader's capacity to influence others (Haslam et al. 2011).

Some contextual factors revolve around the culture of the institution; for instance, typically the Ministry of Defense would have a different culture than the Ministry of Culture and Social Issues. By the same token, what is expected from a leader from the Ministry of Defense may be different from what is expected from a leader from the Ministry of Culture and Social Issues. In a stereotypical scenario, a caring, thoughtful, sensitive, and open-minded individual may be a more prototypical leader in the latter one than in the Ministry of Defense. Leadership prototypicality is encapsulated in the phrase "being one of us," that is, representing the unique qualities that define the group they are leading, embodying the attributes that make the group distinct, and being an exemplar model member of that group (Steffens et al. 2014). Comprehensive reviews (Haslam et al. 2011; Hogg et al. 2012) demonstrate that leader prototypicality contributes to positive leadership outcomes such as trust in leaders (Giessner and van Knippenberg 2008), endorsement of leaders (Ullrich et al. 2009), and perceived leader charisma (Steffens et al. 2014).

A new model of identity leadership (Steffens et al. 2014) is arguing that in addition to "being one of us" (identity prototypicality), leaders need to "do it for us" (identity advancement), "craft a sense of us" (identity entrepreneurship), and "make us matter" (identity impresariorship). And they need to do so in a way in which it fits within the given context. For instance, all the above will be influenced by a war or crisis context (see Haslam et al. 2011 for a detailed review of these factors).

If a leader finds himself/herself in an organization where some or all of his/her authentic self is different to the organizational culture, to really create, represent, and embody follower identity, the leader effectively has three choices. Option one is for the leader to display only aspects of the self that fit within a given context and if necessary "fake it" (Ibarra 2015). The problem

with that option is that, to a degree, it can compromise one of the pillars of authenticity: authentic behavior. A second, more elaborated, although not always possible, strategy is to choose an environment and institution which fit with the "authentic self" of the leader. When this is not possible, but if is still desirable, the leader can slowly "craft a sense of us" which respects each individuals' authenticity and diversity, fostering a sense that it is okay to be different in the given institution. In other words, leaders could create a culture of authenticity in their institutions.

## So Now What?: How to Select an Authentic Leader in an Interview Process?

First of all, it is very important to decide, depending on the culture of the organization and other factors, what type of authentic leader the institution is interested in selecting. As noted in the introduction, there are different conceptualizations of authentic leader, each placing emphasis on different aspects. While George (2003) emphasizes the importance of heart and self-discipline, Shamir and Eilam (2005) emphasize that the authentic leader should not aim to conform to expectations of others and should not be motivated by status; Avolio and Gardner (2005) pay special attention to the internalized moral perspective of the authentic leader. Having said that, the key aspect that should be present in any authentic leader and which can be explored through the selection process is self-awareness as it is undoubtedly the fundamental aspect of authenticity.

There are different processes that can be used which need to be adjusted to the culture of the organization and the type of leader they aim to select. For instance, asking the candidate to tell a story of his/her personal and work life including the personal crucibles would be aligned with George's approach. Selecting a candidate based on responses to specific personal questions in which the applicant is asked to demonstrate and illustrate how he/she does not aim to fulfill the expectations of others, he/she is not concerned with status, he/she leads from his/her point of view, and his/her decisions are based on personal values and convictions would be a way of selecting a candidate based on Shamir and Eliam's (2005) components. If the institution is interested in a candidate with, among other things, internalized moral perspective, Avolio and colleagues have designed a theoretically driven questionnaire (e.g., Walumbwa et al. 2007). Part of this questionnaire also assesses self-awareness, so it could easily be included in the assessment process. Another process is the use of work scenarios with dilemmas relevant to the institution and their culture. Candidates will be asked to immerse themselves in the dilemmas, and their nonverbal communication could be observed as well as their formal responses. Candidates would be asked how they react to the dilemma (behavior, decision, communication with others). Candidates would also be asked to self-disclose in terms of their levels of ambivalence, uncertainty, doubts, willingness to own their mistakes, willingness to ask for negative feedback, etc. To assess somehow whether the candidates "walk the talk and talk the walk," the answers to the scenario question can be contrasted to the answers of the interview and professional life story (when relevant).

However, it is important to bear in mind that the general standard interview process tends to be one in which people feel they can put on a façade to fit with what is expected and the culture of the institution. Therefore they may try to fake their authenticity. To overcome this normal and well-spread tendency, the selection panel would create a safe and nonjudgmental space and explicitly encourage a certain level of self-disclosure from the candidate. If the selection panel is fully engaged in the concept of authenticity, then they might, for example, partake in self-disclosure to set an example for the candidate. This process could signal the applicant that authenticity is valued and incite the interviewee to dare to be different by being himself/herself. Equally the selection panel might include a tour or induction into the organization showing "warts and all" which would again signal the value of authenticity.

## Conclusion

To conclude, it has been argued that there are different ways of conceptualizing authentic leaders, but they are all rooted in self-awareness. Several forms of self-awareness processes have been discussed. Ideally leaders should combine them all to deeply enhance their self-awareness. Nonetheless, it is important to remember that authentic leadership development is a lifelong journey; there are no shortcuts and faster is not necessarily better. Some reflective questions have been offered as pointers for that development, but ultimately, the leader needs to select those with which they can engage at the present moment.

This chapter has also questioned the "one true self" concept and has noted that there are multiple identities that need to be accounted for. In that sense, the authentic leader needs to be aware of his/her different social identities and how they impact on his/her perception, behavior, communication, and decision-making.

It has been noted that successful leaders are those who influence followers to embrace a common purpose. To engage in that level of social influence and engage with the followers psychologically, the model of identity leadership (Steffens et al. 2014) argues that leaders need to represent their followers and be "one of us." So whereas the authenticity of the leader refers to the "I," a successful leader needs to also be authentic to "we" (Adarves-Yorno 2016). Therefore, it is not just a matter of being authentic to "I" as the literature on authentic leadership is encouraging. And it is not just about being authentic to "we" as the identity leadership model would encourage. Successful authentic leaders need to be authentic to both "I" and "we." That is, they need to be true to themselves and also lead in a way that honors the core values, beliefs, and norms of the group they are leading.

Finally, different suggestions have been posited to be considered when designing an interview process. This has opened up the complexities of selecting authentic leaders when they are expected to fit into "us" the institution.

# Authority in Organizations

Dermot O'Reilly
Management School, Lancaster University, Lancaster, UK

## Synonyms

Control; Government; Hierarchy; Influence; Jurisdiction; Leadership; Legitimacy; Management; Power; Rule; Sovereignty

## Definition

Authority is a social relationship between two or more people or objects where one is accorded the right to direct the others in some respect.

## Introduction

Authority is perhaps one of the defining characteristics of organizations, and it tends to be taken for granted, yet it is seldom the object of reflection or research. This is all the more surprising as it was an object of reflection in the work of Max Weber, one of the founding figures of sociology, and was the object of research in Stanley Milgram's experiments into obedience to authority, one of the most famous and controversial social psychology experiments.

The definition of authority used in this entry – that authority is a social relationship between two or more people or objects where one is accorded the right to direct the others in some respect – is developed from Weber's ideas. This entry will begin by outlining why the common conception of authority as formal power is insufficient and move on to Weber's notion that authority is legitimate domination. This is the clearest explanation of what authority is, and how it works, although it is abstract. The following section outlines how Weber's work has been expanded into a deeper understanding of authority as a social relationship. Having outlined how authority can be understood, the following subsection will look at Milgram's social psychological work into obedience to authority which illustrates how authority works in practice. Alternative perspectives for understanding authority, the psychological and psychoanalytic views of authority, will then be introduced.

Following these different perspectives on how to understand authority and how it operates in practice, the final section discusses the role of authority in organizations and in public sector organizations in particular.

## Why Authority Is Not Just Formal Power

The view that authority is formal power is perhaps a very common understanding of authority, and is often implicit in how many people use the word, without them actually defining it as such. The assumption is that authority is the formal power that is ingrained in hierarchical systems – whether they are a religious organization, military organization, or political system. In all these instances there is a formal codification of authority – with differentiations of titles, and explicit rules and obligations – which accords those higher in the hierarchy with a degree of mandated power over those below.

All of these are clearly forms of authority, but when one considers linguistic phrases or terms such as "moral authority," "a voice with authority," or "an authority on the legal system," these phrases suggest that someone can have a degree of respected power even without a formal title, role, or rules, even if this source of respect is informal or difficult to identify. While it would be possible to define authority as formal power, such a restrictive definition would not be capable of shedding any light on the many forms of social interaction that are not shaped simply by formal hierarchy. Indeed such phrases and forms of social interaction that indicate the presence of informal authority imply that there is something about authority that goes deeper than just formal power or hierarchy.

It is just such a recognition that there is something shared between formal authority and the various forms of informal authority that such phrases indicate that Weber articulates in his conception of authority as legitimate domination.

## Authority as Legitimate Domination

Weber discusses authority in the context of his development of a "sociology of domination" – an attempt to understand how some people or groups are capable of being in a superior position in relation to others in modern society. Weber acknowledged the importance of force, but he was particularly interested in how relative stability was accomplished in modern society without the use of force or violence, and, mostly, even without the threat of force or violence.

For Weber, the only way to explain how people in an inferior position accept this inferior position and relationship over time is, quite simply, that

they do accept it – that they see the relationship between themselves and those in a superior position as legitimate, as somehow justified. This accepting of domination, therefore, is what authority is – it is the acceptance of a dominant relationship between one person or group and another. Domination without authority requires force or violence.

This gives the first part of the answer to what authority is – it is legitimate domination – a relationship between two or more people or objects where one is accorded the right to direct the others in some respect. Who, or what, accords this right is crucial to this definition. Those in a superior position can claim a right to direct, but it is only if those in an inferior position accept this claim, that authority is exercised. If a claim to authority is imposed, then the nature of the domination changes from being legitimate (as regarded by the dominated party) to being domination via force.

The central feature of authority, therefore, is a belief by the dominated that the commands of the dominating are valid. This leads to Weber's well-known typology of different forms of authority. In essence, the types of authority are different types of belief in the validity of the commands of the dominating by the dominated. They are different means by which authority is recognized.

These three types of authority, or forms of legitimacy, are:

- Rational-legal authority – which is based on a belief in the legality or correctness of rules and the right of those elevated to hierarchical positions on the basis of such rules to issue commands. This type of authority is evident in states when people accept the rules and outcomes of elections, in the legal system when people accept the rules and judgments of judges, and in organizations when people accept the mechanisms of designing and filling the positions of managerial roles and the right of such managers to direct activity.
- Traditional authority – which is based on established beliefs in the sanctity of immemorial traditions and on the legitimacy of those exercising authority under them. While this calls to mind the image of tribal society and chiefs, it also applies to contemporary customs and habits and those afforded authority according to such customs and habits. Indeed, it is often the case that many organizations operate along habitual lines and exercises of authority rather than operating solely according to explicit rules and lines of command.
- Charismatic authority – which is based on a belief in the exceptional or exemplary character of a person, and of the normative patterns or order revealed or ordained by him/her. Whereas both rational-legal authority and traditional authority are formal, in different ways, in that the rules or customs that justify them can be displayed or interrogated, charismatic authority is not open to rational deliberation. Its basis is not formal but affectual – it is based on an affective submission of the subordinate to the superordinate. It is thus the most immediate form of authority, as it is not dependent on external justifications. It is dependent only on the submission of the subordinate to the person or sayings of the superordinate. As a result of this immediacy, however, it can also be the most fragile or temporary form of authority (for the original, see: Weber 1978, pp. 215–216).

It is important to note that for Weber these were analytical distinctions, and that in any particular case these different forms of authority are intermingled, and often impossible to distinguish from each other. It is also important to note that although authority might be initially established by one means of legitimation, it may develop other forms of legitimacy. Weber believed that owing to the temporary and fragile nature of charismatic authority, those in such positions tend to try and secure their positions by developing customs or rational-legal rules and structures to support them. He also noted that the rational-legal authority that is one of the defining characteristics of modern bureaucratic organizations is often insufficient for such organizations to function. In reality, most such organizations require some people with some degree of charismatic authority in order to function.

### Authority as a Social Relationship

Weber's writings on authority firmly establish a dyadic aspect to authority – that it involves at least two related agents – one that exercises authority and one that defers to the authority thus exercised. Writers following Weber, however, have concerned themselves with understanding what enables this relationship and have argued that there is, in fact, not simply a dyadic relationship, but a triadic, or social, one. Wrong (1995), for example, argues that the authority relationship is not simply voluntary, since the imperatives delivered by the person in authority are seen as legitimate and, therefore, as compulsory by the person submitting to authority.

The source of legitimacy, it is argued, has to come from outside of the dyadic relationship, and this is supplied by culture, history, the community, or language use. This development of Weber builds on the insight that authority requires a belief in its legitimacy and argues that it is always some sort of contextual (cultural) feature that provides the source of this belief in legitimacy. This argument then extends the types of authority beyond Weber's three types, since any type of belief in the legitimacy of an imperative is therefore a source of authority. Wrong uses the example of an imperative given by a professional such as a doctor – their authority is not based in any of Weber's types of authority (it is not simply based on their position in a hierarchy, or tradition, or their charisma) but in the authority of expertise or competence.

Having outlined Weber's conception of what authority is, how it works, and how this has been developed to argue for the social basis of authority, the next subsection briefly outlines some social psychological research that shows how authority is enacted and responded to in practice.

### Social Psychological Research on Authority

Whereas Weber and Wrong discussed authority in the abstract, social psychologists have been interested in how authority is exercised and experienced in real social situations. Building on previous social psychological research on authority, and influenced also by Weber and other social scientists, Milgram's experiments expressly looked at obedience that is willingly assumed without any sort of threat and which is maintained through the simple assertion by authority that it has the right to exercise control over the person.

In short, Milgram's experiments involved volunteers in laboratory experiments. The volunteers were told that they were involved in an experiment on the effects of punishment on learning. They were assigned the role of "teacher" whose role was to test a "learner" and to administer electrical shocks to the "learner" when they provided incorrect answers to a test. The severity of these electrical shocks increased as more incorrect answers were provided, or if no answer was provided, up to a level where they could potentially kill the recipient (from 15 V to 450 V). In reality, the assignment of roles was rigged and the "learners" were accomplices to the experiment. The third role in the experiment was an "experimenter" – an actor playing a researcher in a lab coat. The "experimenter's" role was to give a series of orders to ensure the "teacher" continued if they refused to administer the shock. The aim of the experiment was to see whether or not the "teachers" would inflict high voltages just because they were commanded to by an "experimenter."

In the initial experiment of 40 participants, 65% of the "teachers" administered the full 450 V, and all of them administered up to 300 V. Milgram also carried out a number of variations to the experiment in which he altered aspects of the situation to see how they affected the degree of obedience to authority. From these he concluded that a number of factors affected whether the participants would obey authority – the status of the experimenter (higher status "experimenters" in a laboratory coat elicited more obedience than an "experimenter" who was an ordinary member of the public); the status of the location (slightly less people were obedient when the location changed from Yale University to a set of run down offices); the proximity of the "teacher" to the "learner" (when the "teacher" had to put the "learner's" hand on the shock plate after 150 V the obedience level fell to

30%); social support (when an accomplice to the experiment played another "teacher" that refused to obey, the level of obedience dropped to 10%); and proximity of the authority figure (when the "experimenter" ordered the teacher by telephone from a different room, the level of obedience fell to 20.5%).

Milgram drew a number of conclusions from his study. He regarded the chief finding to be "the extreme willingness of adults to go to almost any lengths on the command of an authority" (Milgram 1974). In order to explain this finding he noted that those who obeyed had a tendency to disavow personal responsibility for the consequences of their actions and to place responsibility on the authority figure of the "experimenter." For Milgram, the experiments showed that obedience to authority tended to override moral considerations depending on how the social situation was structured.

Even those who defied the "experimenter" related themselves to authority. A number of those who defied the "experimenter" questioned their authority and argued that there was a greater ethical imperative calling for the protection of the "learner" over the needs of the "experimenter." Some of these individuals felt that they were accountable to a higher authority. A significant element of defying one form or source of authority, therefore, is to invoke another form or source of authority.

Milgram's experiments can be interpreted as a direct illustration of the conception of authority as a social relationship of legitimate domination. The "teachers" that accepted the commands of the "experimenter" did so because they saw the commands as legitimate. Those that did not accept the commands did not see the commands as legitimate as they invoked a higher, or different source of, authority. The various factors of the social relationship – the status of the experimenter, the status of the location, the proximity of the "teacher" to the "learner," the presence or absence of social support, and the proximity of the authority figure – are all different parts of the social relationship that establish, amplify, or attenuate the perceived legitimacy of the authority figure.

## The Psychological and Psychoanalytic Views of Authority

While both Weber and Milgram draw attention to the social nature of authority, there are alternative psychological and psychoanalytic perspectives that view authority as being a prime psychic drive and need, and which is seen as the reason as to why authority, and submission to authority, is so prevalent in social and organizational life.

In terms of drive, the desire for authority is seen as part of an "authority/power motive," which can be either personalized (that is, a drive for personal power which is self-serving) or socialized (where the drive for power is other-serving) (McClelland 1975). Such authority/power motives are held to be the reason why people strive for positions of power, with the different forms of authority/power motive being held to affect the types of decisions they make. In particular, people who display authoritarian and dictatorial behaviors are held to be narcissistic, antisocial, aggressive, and often destructive because the motive behind their power and authority is primarily self-serving.

In contrast, the need to submit to authority is often seen as a primal or infant need for a father or mother figure according to psychoanalysts such as Freud or Lacan. According to this line of thought, the authority relationship is powerfully shaped by the subordinate's psychic fantasies. These are very much linked to the subordinate's earliest experiences of their mother and father as authority figures, and the subordinate is seen to want to rescind their autonomy and responsibility in favor of the psychic security of conforming to the authority figure. Research on ego development and moral reasoning suggests that psychologically immature individuals are more likely to conform to authority. For example, Freud (1922) argued that when involved in a crowd, individuals' superegos collapse and, through an unconscious process of transference, they are replaced symbolically by the authority figure, who then becomes the individual's guide to action.

Having presented alternative psychological and psychoanalytic conceptions of authority, the

final section applies these perspectives to understanding authority in organizations and, in particular, in public service organizations.

## Authority in Organizations

Authority, as a social right to direct others, is a key component of the political nature of organizations – how, what, and why decisions are made; who makes them, the allocation of resources; and who benefits. As such, the questions as to who has authority, over what, and to what degree are key issues in organizational politics, as different individuals, groups, or functions debate and deliberate on areas of jurisdiction, modes of allocation, lines of communication, and means of adjudication. Contemporary studies of organizations suggest that the answers to these questions have to be developed, negotiated, and reinterpreted over time, rather than being definitively settled by prior decisions and procedures. Prior decisions and procedures, however, do have a significant influence in how these questions are interpreted and addressed because they are a key part of the social and cultural fabric that affords legitimacy to certain positions or actions.

While the rational-legal form of authority may be the most obvious aspect of contemporary organizations, for example, in the distribution of positional titles, organizational rules, and procedures, and the capacity to allocate rewards or sanctions, others forms and sources of authority are evident. The need for other forms of authority is in fact partly necessitated by the irony of bureaucratic authority. The irony of rational-legal bureaucratic authority is that the formal power and administrative autonomy of the administrator in a bureaucracy is significantly delimited by rules and procedures. The bureaucratic administrator is only officially empowered to implement rules and procedures; they do not have the formal power to act beyond them. While this may not be an issue in relatively stable environments, in less stable environments it can result in organizational stasis and subsequent brittleness. It is partly arguments about the inflexibility of public service organizations that led to the "new public management" in many countries as an attempt to empower public service managers.

Rational-legal bureaucratic authority also has a particular inflection in public service systems – owing to the tradition of the separation of powers between the executive, the legislature and the judiciary, and the system of checks and balances, there is often not a single source of authority in public service organizations. Rather, although public service organizations are in many respects an executive function of government, they are sometimes subject to pressure from external parties as well as from the legislative and can be held to account by the judiciary for their processes and outcomes. The public service motivation and public value literatures would also suggest that for many who work in public service organizations that the ultimate authority is not the government (or the judiciary) but the moral authority of the public good.

## Conclusion

This entry has provided an overview of how authority has been conceptualized, of some of the classic studies of obedience to authority, and a discussion of the role of authority in organizations and public service organizations.

The entry began by outlining why the common conception of authority as formal power is insufficient for accounting for the many instances when authority is present in social relationships that are not structured by formal hierarchy. Weber's conception of authority as legitimate domination was then developed. For Weber, authority is seen as a social relationship between parties whereby one party accepts the legitimacy of the other to direct them in some manner. This conception holds that the central feature of authority is a belief by the dominated that the commands of the dominating are valid. Weber's typology of legitimacy was outlined: rational-legal authority, traditional authority, and charismatic authority.

The entry then considered how Weber's ideas have been developed beyond considering the

dyadic relationship between two parties, to acknowledge the role of cultural and social features in supplying the basis of legitimacy. This argument thus extends the types of authority beyond Weber's three types to any cultural or social feature that is used to accept the legitimacy of an authority.

The entry then outlined how Milgram's experiments into obedience to authority illustrate how authority, as a social relationship of legitimate domination, works in practice. The "teachers" that accepted the commands of the "experimenter" did so because they saw the commands as legitimate. Those that did not accept the commands did not see the commands as legitimate as they invoked a higher, or different source of, authority. The various factors of the social relationship that Milgram varied in different experiments are all different parts of the social relationship that establish, amplify, or attenuate the perceived legitimacy of the authority figure.

The entry then outlined alternative psychological and psychoanalytical views on authority which regard authority as being a prime psychic drive and need. This is seen, by some, as the reason as to why authority, and submission to authority, is so prevalent in social and organizational life.

The final section of the entry then discussed the role of authority in organizations. In particular, the role of authority in organizational politics – where different individuals, groups, or functions debate, contest, or deliberate on areas of jurisdiction, modes of allocation, lines of communication, or means of adjudication. The vital role of the questions as to who has authority, over what, and to what degree in these processes was highlighted. It was noted that contemporary studies of organizations suggest that the answers to these questions have to be developed, negotiated, and reinterpreted over time, rather than being definitively settled by prior decisions and procedures. Prior decisions and procedures, however, do have a significant influence in how these questions are interpreted and addressed because they are a key part of the social and cultural fabric that affords legitimacy to certain positions or actions.

This section also pointed to the question of authority in public service systems, where the tradition of the separation of powers between the executive, the legislature and the judiciary, and the system of checks and balances often means that there is not a single source of authority in public service organizations.

The development of Weber's ideas to understand that authority is a social relationship between two or more people or objects where one is accorded the right to direct the others in some respect is thus helpful in understanding and interrogating the dynamics of organizations. The question of authority in organizations – the sources of its legitimacy, and the cultural and social features and relationships that establish, amplify, or attenuate its legitimacy – is a crucial issue in the public sector, in particular, in how it relates to the distribution and use of power.

## Balanced Scorecard

Leonor Mora
King Juan Carlos University, Madrid, Spain

### Synonyms

Control panel; System of strategic indicators

### Definition

The Balanced Scorecard is a management tool whose purpose is to communicate and help to operate the strategy of an organization. It consists of financial and nonfinancial indicators that should refer to their key factors, i.e., strategic factors for the future of the organization viewed from the main internal and external dimensions that affect it.

### Introduction

The concept of the "Balanced Scorecard" stems from the private sector environment; specifically Kaplan and Norton (1992) were the ones who, during the 1990s, proposed it as a tool to overcome the hitherto traditional analysis based on financial indicators and short-term measures (insofar as they did not incorporate any measure of strategic factors and their information was based on ratios about the past and the present of the organization). Nonetheless, the first antecedents to the concept that served as source of inspiration for these authors can be traced to the *Tableau de Bord*, used in France during the 1960s that intended to show, in a single document, several financial ratios for the control of the company (Meyer 1969), as well as to Michael Porter's theories of "value chain in the company."

The use of non-strictly financial indicators in order to assess the strategic dimension of the company involves incorporating to the management control of the organization the monitoring of their intangible assets, such as the knowledge and training of their employees, their internal procedures, etc. Thus, Kaplan and Norton gathered up the interest of the accounting literature to find a method to assess this intangible capital (see Flamholtz 1974; Caplan and Landekich 1975; Grove et al. 1977, cited in Kaplan 2010, p. 8).

In their classical version for private companies, they consider four perspectives or approaches on which the key indicators should be defined; these are the financial perspective, the customer perspective, the business process perspective, and the learning and growth perspective (related to the employees of the organization). For each perspective, key control indicators will be defined in a way that the managers of the organization might, periodically, have the information for appropriate decision taking.

## Balanced Scorecard Framework and its Practical Applications Example of the Public Sector

The Balanced Scorecard is not a template or standard model that could be applied to any organization in a general way. The activity of the organization, the market conditions, the particular strategies depending on the offered product or service, and the degree of competition in the environment in which the entity operates determine which specific Balanced Scorecard is the most appropriate for each organization. In public administration, and from the four mentioned classic perspectives, it is possible to identify the following ones:

- Budgetary and financial perspective
- Citizen perspective (users of public services that can be identified with the customers in a private organization)
- Internal process perspective (referred to as the processes followed during the provision of public services)
- Civil servant perspective (also called potential perspective, as it addresses the resources and capabilities the organizations count on in order to develop their activity)

The construction of the matrix of indicators in each area or perspective is developed after the environmental analysis in which this administration operates, allowing the identification of the major strategic issues to be addressed.

We develop in more detail these four perspectives taking into account that the proposed factors are examples. Other different factors will depend upon the specific organization in which the Balance Scorecard is set:

- Budgetary and financial perspective: includes factors such as investment capacity, budget deficit or surplus, capital raising capacity from other governmental organizations and private entities, etc.
- Citizen perspective: metrics covering key factors such as satisfaction of citizens in the face of the public services they receive, citizen participation and involvement in public decisions, perception of transparency in public administration, etc.
- Internal process perspective: metrics that measure the provision of public services in dimensions such as promptness, standardization, quality, simplification of processes, capacity for their redesigning, etc.
- Civil servant perspective or potential perspective: considers the productivity by employee, satisfaction of the employee, their suitability for the work they are carrying out, their participation in training programs, etc.

As already mentioned, these perspectives can be modulated or complemented by others depending on the specific entity and their functions in the public scope, provided they are truly strategic for the future of the organization. In this regard, some authors (López and Gadea 2001) propose the incorporation of territorial sustainability perspective or social cohesion perspective.

Whatever the perspectives selected, the work method for the construction of the Balanced Scorecard involves the definition of concrete objectives for each of them. Together with the objective, a strategic result indicator will be defined, i.e., the ratio or indicator that will measure the achievement of that objective, as well as a performance indicator. The latter takes a specific quantitative value that represents the value that the organization wants for the defined objective. It is also possible to attach and describe qualitative strategies for each indicator that summarize the policy of the organization in regard to the objective.

We propose an example of this methodology, assuming that the organization that formulates the Balance Scorecard is a public university. On the assumption that, within the internal process perspective, it takes as objective "Increasing the number of practical classes taught by subject," the work to be done in relation to the objective would be as follows (Table 1):

This methodology would be replicated for the rest of the objectives of all the selected areas. Regarding the number of objectives the tool should have, it should be noted how, in many

cases, the high number of selected indicators can both decrease the effectiveness of the Balanced Scorecard – as it might contain redundant information – and hinder the overall vision it should provide to the managers. Kaplan and Norton (1997) suggest between 12 and 24 indicators for the Balanced Scorecard to be focused on the success factors and to be absorbed by the organization. There is no reason that this recommendation made for the private sector scope does not apply to the public administration environment.

It is also important to emphasize how the objectives identified in each perspective can be linked together, because they all serve to the same strategy. Graphically these links can be drawn through cause-effect diagrams or maps. The basic outline of a map of objectives for a Balanced Scorecard that is applicable to public administration may be as follows (Chart 1).

**Balanced Scorecard, Table 1** An example of Balanced Scorecard

| | |
|---|---|
| Objective | Increasing the number of practical classes taught by subject |
| Strategic result indicator | Percentage of hours of practical lessons taught divided by the total hours of the subject |
| Threshold/ trigger | 50% of the hours devoted to practical classes divided by the total hours allocated to the subject |
| Strategies | Reinforcing the educational staff with professors devoted to practical classes<br>Reviewing of the educational guidelines of the subjects incorporating methodologies based on practical work |

## Usefulness of the Balanced Scorecard in the Public Environment

In general terms, for any type of organization – private or public – the Balanced Scorecard can be very useful, starting from the missions of the organization: to set specific objectives, to design the system of execution and control indicators, and to analyze the results achieved within a logic of purposes or goals and required means or resources (Barros Da Silva and Rodríguez González 2004).

Kaplan and Norton (1992) summarize the usefulness of the tool in aspects such as the clarification and updating of the strategy, the communication of this strategy to the entire organization, the ability to align the individual objectives or goals of the different members of the organization to that known common strategy, the linkage of the objectives to the long-term budget, and the ability to conduct the reviews on the functioning of the internal processes toward the improvement of the strategy itself.

In fact, this tool adds value in the specific field of the public entities. Since the Balanced Scorecard incorporates financial and nonfinancial indicators, its use in entities such as public institutions where nonfinancial aspects prevail on financial ones is particularly appropriate. We will not go into detail in the prominence of the qualitative aspects over the financial ones in public organizations, although we need to only recall the main differences in the concept of "financial management" in both scopes: different financial objectives, higher number of stakeholders, different nature of the so-called shareholders of these

**Balanced Scorecard, Chart 1** Map of objectives for a Balanced Scorecard (Source: Adapted from Kaplan (2010, p. 4))

public bodies, and public funding mechanisms in which, as noted by Holtham (1984), it is more appropriate to consider finance in many senses as a constraint rather than as a target.

Thus, while keeping the budgetary and financial perspective of the Balanced Scorecard in private enterprises, the absence of a strictly economic goal (maximization of profit or search for returns) and the economic backing that often have public entities in the event of budget difficulties (transfers or collaterals from the administration on which the public entity is dependent) make that the most relevant perspectives are precisely the other three: citizen, internal process, and potential perspectives.

The richness of this tool over other more traditional (ratios, financial management control, etc.) is in its qualitative and strategic dimension. Its application in specific experiences that are cited in the next section demonstrates its usefulness to unite the management team and the entire organization, conveying the strategic objectives toward the day-to-day running of the organization. The use of the Balanced Scorecard for the modification of cross complex internal processes that affect various areas or departments of the organization also seems to be positive.

From a European perspective, Ruiz Muñoz (2006) highlights how governments are challenged by the request of their citizens for the provision of public services (this has certainly contributed to the generalization of the welfare state as a generally accepted principle to formulate the budgetary policy of the public bodies). In this environment, management tools such as the Balanced Scorecard can be a great help in trying to achieve the objective of providing a public service of the highest possible quality. In this regard, it should be noted how the implementation of the Balanced Scorecard usually reflects the influence of the excellence models, such as the "European Foundation for Quality Management (EFQM)" (Dale 2002, cited in Ruiz Muñoz 2006). The EFQM excellence model shares with the Balanced Scorecard some basics: focus on customers, pursuit of the continuous improvement and innovation, care in partnership and venturing with vendors and suppliers, focus on leadership, coherence in the strategic objectives, development and linkage of people, and assessment of the results.

Nonetheless, both concepts should not be confused, as although they have a common philosophy, EFQM may be considered as a helper method for improving the organization, while the Balanced Scorecard is a real management tool that allows to evaluate the achievements of the organization in the controlled perspectives.

## An Example of Balanced Scorecard in the Public Environment

Although the Balanced Scorecard of a specific public organization, as already mentioned, depends on the type of entity and its specific activity, in this section we will include some of the features that, as per our understanding, these indicators should have, depending on which perspective is concerned, while we try to propose some valid indicators also for public organizations in each of the four perspectives aforementioned.

### Budgetary and Financial Perspective

According to the objectives that the organization has raised for its financial area, they should choose indicators that approach the budget performance and financial balance of the entity. These are structure indicators that will inform on the use (generation and consumption) of resources and that will provide information on the cost of public services. The inputs for the construction of these indicators will come from the accounting and financial statements, so they will be numerical indicators with quantitative information. Among others, we propose the following:

- Total budget income linked to the service
- Total budget expense linked to the service
- Gross savings or difference between current income and current expense
- Budget deficit or surplus measured as the difference between financial income and expense
- Total capital spending or investment spending associated with the service
- Financial liabilities on current income

### Citizen Perspective

The indicators that show this perspective are result indicators, i.e., those that report on final impact of public policies on citizens. For its construction, it will be required not only the economic or activity inputs but also those compared with the outputs offered to citizens. Even beyond, it is trying to approximate the measure not only to the service actually provided to the citizen but to the perception the citizen might receive from the service. Ultimately, the satisfaction of the citizens is, by itself, a result of the public action. In order to incorporate the citizen's point of view, it is necessary to use methodologies for the knowledge of the citizen perception such as the survey, the collection of complaints through suggestion boxes, etc. With this information, it will be possible to build indicators such as:

- Number of complaints attributable to public service
- Number of complaints attributable to other services that interact with the assessed service
- Number of suggestions related to the service received (it allows to evaluate the degree of citizen participation and involvement)
- Quantitative assessment of the quality perceived by the citizen (provided the accomplishment of a previous survey, allowing to assess in a certain scale the level of satisfaction of the citizen)
- Quantitative assessment of the perceived transparency by the citizen (provided the accomplishment of a previous survey, allowing to assess in a certain scale the level of perceived transparency by the citizen)

The use of information and communications technologies (ICT) will undoubtedly facilitate the development of these indicators, to the extent that the administration has a website that allows citizens to interact. It will provide valuable elements to assess the citizen's perception to the activity performed by the entity.

### Internal Process Perspective

In order to capture the internal process perspective, we will use process indicators that inform both the number of activities undertaken and their quality. These indicators will give information on the processes or action programs before obtaining definite results, as well as on how the planned program is executed to achieve the proposed objectives. The ultimate goal, from this perspective, will be to measure the capacity of the organization to act, focusing not only on results but also on analyzing whether the system, with their respective protocols and procedures and works. That is, we will try to measure or compare actual activities with those that are planned or used resources versus actual activities.

Some key features that should be measured are capacity of innovation, adaptation to the environment, and change management. We propose several indicators, for example:

- Number of performed activities (in ordinary processes)
- Activities successfully completed (to measure specific projects)
- Number of provided services/global cost of the service
- Temporary deviations (measured in days, hours, as appropriate) between phases of a global process with a priori time planning

### Civil Servant Perspective or Potential Perspective

The indicators to be raised from this perspective should provide information on how the resources and capabilities of the organization and possibilities for improvement in this regard have been used. These indicators on intangible but strategic elements for the organization should be considered (i.e., indicators on motivation and satisfaction of the employees and future needs of this human capital). Examples of indicators for this perspective could be the following:

- Training received by public workers (it may be possible, by professional category, to establish specific training hours, distinguishing where appropriate if it is theoretical or practical)
- Qualifications obtained by workers that participate in training programs (or any other measure that report on the degree of successful completion of the received training)

– Quantitative assessment of the degree of job satisfaction of employees (it will require a previous survey that allows the self-assessment according to numerical criteria)

## Conclusion

The Balanced Scorecard has been used in public entities from different sectors. A bibliographic review shows the health sector as one of the pioneers in the use of this tool. In this context, the works conducted by Dana Forgione (1997) should be highlighted. Forgione detected, as from the workshops organized by the "European Institute for Advanced Studies in Management," the existence of an increasing demand of the use of the Balanced Scorecard in the sector. In particular, he spotlighted the contributions that this tool could offer to health institutions for financial control and management of the quality of the service. Since the publication of the article by Dana Forgione, many works regarding the adaptation to healthcare environment have followed. In Ruiz Muñoz (2006), we can find references to the works by Curtright Jonathan, W. et al. (2000) and Pink George, H., (2001).

However, the transition from theory to practice can be found in 1997 with the project of developing a Balanced Scorecard for the hospital system in Canada. The project was extended to 89 hospital organizations in the area of Ontario. The proposed Balanced Scorecard encompassed indicators related to the activity of the participating centers and allowed the public circulation of the provided information. Baker (1998) published the information of this project, providing levels of performance indicators designed for this project.

In the Spanish environment, Ruiz Muñoz (2006) develops a Balanced Scorecard for a specific hospital, the Parc Taulí Health Consortium, located in the Catalan town of Sabadell.

Another sector where many references on practical applications of Balanced Scorecards can be found is that of higher education institutions or universities. There are interesting experiences developed between the nineties of the last century and early years of this century. In this regard, see Pupius et al. (2003, p. 16), Johnson (2003, p. 28), Cullen et al. (2003, p. 8), and Rohm (2003), who provide specific references to their successful implementation in universities such as the University of Edinburgh, Open University, Glasgow Caledonian University, or Napier University. Other experiences supported in the academic literature should be noted, such as the ones at the University of California, 1999 (O'Neil and Harold 1999); Ohio State University, 2007; Universitat Pompeu Fabra, 2000; Universitat Jaume I, 2000; Fort Hays State University, 2003; (Zbinden 2002; Ramírez Córcoles and Baidez González 2011); etc.

The complexity of the university activity and management suggests the use of advanced management tools such as the Balanced Scorecard. The plurality of objectives pursued by public institutions of higher education, as well as the absence of a single measure of the success of the organization, recommends the definition of different indexes to give a sufficiently broad view of the goodness of the management and the achievement of the objectives and goals at both strategic and operative level.

## Definition

### Civil Service

Usually, the civil service of a country includes all permanent functionaries of government which distinctly excludes defense service. Moreover, a member of civil service cannot hold a position in the political or judicial office. Briefly, civil service is a part of the executive branch that performs the functions and activities of the government.

### Cadre

Cadre is the distinct functional subdivision of the government services developed according to law and has specific recruitment and promotion rules. Each cadre consists of a certain number of posts. In Bangladesh, a small percentage of the civil servants are recruited to the cadre services. Jobs in the cadre services are considered highly prestigious.

## Introduction

Civil service is the executive organ of a state having specific structures, rules, values, and responsibilities that support the implementation of government policies and programs for the welfare of the people. The civil service systems in Bangladesh has a traditional colonial legacy inherited from the British colonial rule that is

still in practice. However, to cope with the continually changing world, a modern, meritorious, and efficient civil service is inevitable. Thus, the government needs to recruit and select talented, competent, and committed civil servants. Considering the socioeconomic context of Bangladesh, a job in the cadre service is considered as one of the most prestigious as one enjoys a high salary along with various facilities here that other service holders usually are not entitled to. Therefore, civil service most particularly the cadre services is regarded as one of the most demanding professions in Bangladesh. The Bangladesh Public Service Commission (BPSC), one of the most significant constitutional bodies in Bangladesh, arranges the Bangladesh Civil Service (BCS) Examination to recruit fresh entrants in the service. However, questions arise very frequently regarding the credibility and quality of the existing BCS Examination system. Based on secondary sources, i.e., books, journals, research reports, newspapers, and the Internet, this chapter examines loopholes in the examination process and suggests a few recommendations to improve the examination system.

## Civil Service System in Bangladesh

Bangladesh Civil Service consists of class I, II, III, and IV personnel. Moreover, the civil servants can be categorized into two further groups: Class I and part of class II officers are gazetted I officers with higher powers, responsibilities, and greater privileges, whereas the remaining belongs to non-gazetted. Furthermore, the service is again divided into two groups: cadre and non-cadre. Within the public service, a very small number of civil servants belong to the cadre services. Class I cadre posts are classified vertically into six ranks: secretary, additional secretary, joint secretary, deputy secretary, senior assistant secretary, and assistant secretary in terms of seniority and status. Bangladesh follows a closed entry system where class I officers are recruited directly in the cadre services through an open competitive examination known as BCS Examination, conducted by the BPSC to the post of assistant secretary and alike. At present, there are 26 cadres in the civil service of Bangladesh. According to the prescribed educational qualifications, the cadres are divided into general cadres and technical/professional cadres (Ara 2013).

### General Cadres

BCS (Administration), BCS (Ansar), BCS (Audit and Accounts), BCS (Cooperative), BCS (Customs and Excise), BCS (Foreign Affairs), BCS (Family Planning), BCS (Police), BCS (Postal), BCS (Railway Transportation and Commercial), and BCS (Taxation).

### Technical/Professional Cadres

BCS (Agriculture), BCS (Fisheries), BCS (Forestry), BCS (General Education), BCS (Health), BCS (Livestock), BCS (Public Health and Engineering), BCS (Public Works), BCS (Railway Engineering), BCS (Roads and Highways), BCS (Statistical), BCS (Technical Education), and BCS (Trade).

Besides BCS (Food) and BCS (Information), cadres recruit candidates in both general and technical/professional categories (BPSC 2019).

## Recruitment Rules of Bangladesh Civil Service

The first comprehensive recruitment rules, BCS Recruitment Rules (1981), were declared in 1982 for the appointment of officers to various cadres of Bangladesh civil service, and the first BCS Examination was conducted in 1982. Currently, for direct recruitment at the entry level, the Bangladesh Civil Service (Age, Qualification, and Examination for Direct Recruitment) Rules 2014 has to be followed.

There are three types of recruitment procedures for the different cadres of the civil service in Bangladesh:

- Direct recruitment through open competitive examination at the entry level
- Recruitment through promotion
- Recruitment through transfer or deputation

Generally, the respective ministry informs BPSC about the number of vacant posts through the Ministry of Public Administration (MOPA). BPSC then invites candidates to apply for the vacant posts by advertisements in daily newspapers. The eligible candidates are invited to appear in a preliminary test. The applicants who succeed in the preliminary test have to sit in a written examination. Candidates who passed the written test are considered qualified for oral examination followed by a psychological test. If any applicant disqualifies in the psychological test, he/she is not considered for final selection. Based on the results of the written examination, psychological test, and the viva voce, a final selection is made to send to the MOPA. Candidates then go through physical examination at designated hospitals arranged by the Directorate General of Health Services (DGHS). Besides, every single candidate needs a police report to certify that he/she has no criminal report or engaged in any activity subversive of the state. The MOPA arranges the final approval of the President before issuing the letter of appointments (Ara 2013).

## Bangladesh Civil Service Examination

The BCS Examination is considered one of the hardest and competitive examinations. Initially, 29 cadre services were formed in the civil service of Bangladesh, and accordingly, BCS Examination was held in 1982, 1983, and 1984 based on written and viva without any preliminary test. In 1985, a new system of examination was introduced which is currently in practice to recruit fresh candidates at the entry level (BPSC 2013). Since the introduction of the BCS Examination, the BPSC has completed 39 examinations, and the 40th BCS applicants are waiting for a written examination. BPSC has published the circular for the 42nd and 43rd BCS Examinations in November 2020.

### Eligibility Criteria to Apply

Receiving vacancy list from the MOPA based on the BCS (Age, Qualification, and Examination) Rules 2014, BPSC circulates an advertisement through its website and national dailies mentioning cadre wise educational qualification, examination fees, tentative date of examination, subjects of written examination for a particular cadre, age, and other terms and conditions of the job. A candidate has to complete all formalities mentioned by BPSC. Any citizen of Bangladesh fulfilling the required eligibility can apply irrespective of his/her sex.

#### Age Limit

- If the age limit of the candidates is below 21 and above 30 on the first date of the month when the advertisement is circulated by BPSC, he/she will not be considered as worthy candidates of the BCS Examination.
- The maximum age limit for freedom fighters and their sons, daughters, grandchildren, disabled candidates, and BCS (Health) cadre candidates is 32.
- In the case of BCS (General Education), BCS (Technical Education), and BCS (Health), the maximum age limit of tribal candidates is 32, and in other cases, the age limit is 30.

#### Educational Qualification

- A master's degree from any recognized university or a degree that requires at least 4 years of education after passing the Higher Secondary Certificate (HSC), i.e., year 12 examination or equivalent, provided that, in his/her academic career, an applicant with more than a third division/class is not qualified.
- If a candidate appeared at any examination that is threshold level for BCS Examination, he/she will be able to apply, provided that all written examination would have been completed by the deadline of applying.

All appeared candidates have to submit their original or provisional certificates as education qualification from any university to BPSC before the interview board. Educational qualification for technical/professional cadre depends on respective cadres. Generally, a graduation degree is needed to apply in a professional/technical cadre. However, usually, third-class graduates are not accepted in most of the technical cadres.

### Nationality

The candidate must be a citizen of Bangladesh. Besides, he/she cannot marry or promise to marry a foreign citizen without prior permission from the government of Bangladesh.

## Quota in the Civil Service

In Bangladesh merit and quota both were used in recruitment. According to the quota system, 44 percent of available posts would be filled based on merit while the remaining 56 percent by district quota. The district quota was further distributed, i.e., 30 percent for families of freedom fighters, 10 percent for women, 10 percent for disadvantaged districts, 05 percent for small ethnic groups, and 01 percent for people with disabilities. However, due to criticisms from academics and researchers and countrywide movement by students and job seekers against quota, the government announced the abolition of quota in recruitment of class I and II civil servants in 2019. Accordingly, BPSC declared that from the 40th BCS Examination, recruitment to the service would be based solely on merit (Senior Correspondent 2020).

## Structure of the Examination System

As per the provisions of BCS (Age, Eligibility, and Direct Recruitment Examination) Rules 2014, BPSC conducts the following three steps of recruitment examination to recommend suitable candidates in the civil service of Bangladesh:

- Multiple-choice question (MCQ)-type preliminary test of 200 marks
- A written test of 900 marks for candidates who passed in the preliminary test
- Oral test of 200 marks for the successful candidates in the written test

### Preliminary Test

BPSC conducts an MCQ-style preliminary examination of 200 marks with 200 questions to select a certain number of suitable candidates for the written test. Until the 34th BCS Examination, the preliminary test was taken at 100 marks. However, a new system has been introduced to take the MCQ-type preliminary test on 10 subjects in 2 hours from the 35th BCS Examination as per the BCS Examination Rules 2014. Additionally, the provision for deduction of 0.50 marks is introduced for each wrong answer given in the preliminary MCQ test so that no candidates can get undue advantage by making answers on a guess (BPSC 2015). Subjects and marks distribution in the preliminary test are as follows:

| Subjects | Marks |
|---|---|
| Bangla language and literature | 35 |
| English language and literature | 35 |
| Bangladesh affairs | 30 |
| International affairs | 20 |
| Geography (Bangladesh and the world), environment, and disaster management | 10 |
| General science | 15 |
| Computer and information technology | 15 |
| Mathematical reasoning | 15 |
| Mental skills | 15 |
| Ethics, values, and good governance | 10 |
| **Total** | **200** |

Topics under Bangladesh affairs are:

- National affairs of Bangladesh: the history of Bangladesh (ancient to modern); culture; the history of independence war of Bangladesh; language movement; the election of 1954; six-point demands 1966; mass movement 1968–1969; the general election 1970; noncooperation movement 1971; historical 7 March Speech of Bangabandhu; declaration of independence; composition and functions of Mujibnagar government; strategies during the war of independence; the role of superpowers during the war of independence; the surrender of the Pakistan Army; and the emergence of Bangladesh.
- Agricultural resources of Bangladesh
- Economy of Bangladesh
- Industry and commerce of Bangladesh
- The Constitution of Bangladesh
- System of government in Bangladesh

### Written Test

Candidates declared successful by BPSC in the preliminary test have to appear in the written test. Initially, each candidate had to sit for an

examination of 1600 marks when the open competitive examination for BCS recruitment started in 1982. However, the total marks were reduced to 900 in 1984. BPSC decided to increase the total marks again in 1985. Since then, each candidate had to participate in an examination of 1000 marks: 500 marks for compulsory subjects, 300 marks for optional subjects, and 200 marks for the viva voce. The five compulsory subjects were Bangla, English, Bangladesh affairs, international affairs, and general mathematics and science with 100 marks for each. Besides, a candidate could choose 3 subjects from 64 optional subjects each carrying 100 marks. The technical/professional cadres had no optional subject examinations; 300 marks were based on the candidate's academic achievements (BPSC 2004).

BPSC instigated a reform in 1998 to restructure the BCS written examination system to fit with the contemporary demands. Subsequently, in 2004, BPSC decided to introduce a uniform system of BCS Examination system in which all examinees have to sit for the same subjects (except for examinees sitting for technical/professional cadres) to be effective from 2006 with the 27th BCS Examination. Therefore, candidates missed the scope to choose optional subjects that gave an extra facility to the students having a science background in previous examinations (BPSC 2011). Currently, both general and professional cadre candidates have to sit in a written test of 900 marks.

According to the latest provision of BPSC, a candidate with less than 30% marks in the written examination, instead of the previously existing 25%, would be considered to have received no number. Besides, from the 38th BCS Examination, 2 examiners are set to check the answer scripts. Additionally, an answer sheet is to be re-evaluated if the difference between the marks given by the two examiners exceeds 20. Candidates who give preference for the posts of both general and technical/professional cadres are required to appear for the written examination of 200 marks in the relevant subject for additional posts or services in addition to 900 marks in the subjects prescribed for the general cadres. The time allotted for each subject consisting of 200 marks is 4 hours. In the case of a subject consisting of 100 marks, the allotted time is 3 hours. The pass mark for the written test remains the same as 50% (BPSC 2015, 2019). Subjects and marks distribution in the written test are:

| General cadres | Marks | Technical cadres | Marks |
|---|---|---|---|
| Bangla | 200 | Bangla | 100 |
| English | 200 | English | 200 |
| Bangladesh affairs | 200 | Bangladesh affairs | 200 |
| International affairs | 100 | International affairs | 100 |
| Mathematical reasoning and mental skills | 100 | Mathematical reasoning and mental skills | 100 |
| General science and technology | 100 | Job-related subjects | 200 |
| **Total** | **900** | **Total** | **900** |

Source: BPSC (2019)

### BCS Oral Examination

Candidates who have passed the written test of the BCS Examination are required to sit in an oral test of 200 marks. The minimum pass mark in the oral test is 50% instead of the previously existing 40%. BPSC creates the Board of Oral Examinations as per the provisions of the BCS Examination Rules 2014 with the Chairman/Member of the Commission who acts as the Chairman of the Board, officers of the rank of joint secretary or above nominated by the government as Board member, and thematic experts as the Board member nominated by BPSC.

## Problems and Issues in the BCS Examination

The current system of BCS Examination fails to recruit meritorious officers in the civil service of Bangladesh. Several reasons affect the overall process of recruitment. First, the existing examination process is time-consuming and outdated. The 35th BCS Examination circular was issued on 09 September 2014, and the final result was published on 17 August 2016. The whole examination process took about 2 years. MOPA began to issue appointment letters on 02 April 2017. Advertisement for the 36th BCS Examination

was published on 31 May 2015, and BPSC published the final result on 17 October 2017. It took 2 years and 5 months to complete the examination. MOPA started issuance of appointment letters on 31 July 2018. Likewise, the 37th BCS Examination took 2 years and 4 months, while MOPA began to issue the appointment letters on 20 March 2019. BPSC needed 3 years and 10 days to publish the final result of the 38th BCS Examination. However, the issuance of the appointment letter by the MOPA has not yet been completed due to Covid-19 catastrophe. Exceptionally, BPSC took only 1 year to complete the 39th BCS Examination that was conducted to recruit only health professionals. The 40th BCS Examination candidates are awaiting their written examination result; the 41st BCS Examination applicants are waiting for the preliminary examination (BPSC 2019; MOPA 2021), while BPSC has published the 42nd and 43rd BCS job circulars. Thus, it is evident that BPSC typically spends almost 2 years finalizing the BCS Examination recruitment process. Then about 1 more year is required to complete the medical test, police verification, and issuance of appointment notification. Although it is expected that the recruitment process starting from job advertisement to final result must be completed within a year, however, it is not happening. Additionally, the system of dual examiners for the evaluation of written scripts launched since the 38th BCS Examination may further delay the result.

BPSC announced to reform the BCS Examinations, and thereby it was expected that various changes would be incorporated in the examination. However, the changes are merely cosmetic. The syllabus and questions of the civil service examination are designed in such a way that seems unsuitable to test the analytical or managerial skills of the candidates. For example, in the Bangla Paper I, 30 marks are allocated to grammar (correction of errors in sentences, filling in the blanks with correct words, changing simple sentences to compound and complex, and use of idioms and phrases), 20 marks each to the elaboration of ideas and writing summary, and 30 marks for short answers to questions about Bengali literature – from medieval to modern. In Bangla Paper II, 40 marks are assigned to writing an essay and 15 marks each for translation (from English to Bangla), fictional dialogue, book review, and letter writing. Such content suggests that the examination aims at finding talent for administrative and support roles rather than looking for leaders and managers who may lead and manage during transition or crisis. Furthermore, the mathematics paper tests algebra, geometry, and elementary statistics. Class I officers are unlikely to solve such mathematical problems in the course of their government work. In the Bangladesh affairs paper, candidates are asked to explain how Bangladesh came into being as an independent nation or to describe the development policies followed during the first decade of independence. Likewise, as part of the international affairs paper, candidates have to write about the different organs of the United Nations. The questions are descriptive rather than analytical and exploratory. Therefore, it fails to test whether a candidate possesses good analytical ability or whether he/she can learn from real-life experiences and apply it in his/her job, or whether he/she can lead and manage changes (World Bank 2006). Moreover, it is widely believed that the subjects in the written examinations are favorable to the candidates with science or related backgrounds, thus creating discrimination. Besides, many mediocre students passed the examination by memorizing traditional guidebooks because of the nature of questions.

Allegations against the leakage of BCS question paper have become a regular practice. The Criminal Investigation Department, Bangladesh Police, has announced on 01 February 2019 of arresting a gang of people in 1.5 years who were involved with BCS Examination question paper leakage for the last few years (Staff Correspondent 2019). This incident affects the validity and credibility of the examination system.

Despite recommended by BPSC, several candidates are regularly dropped out due to negative police verification reports. A candidate is considered unfit for recruitment if he/she is charged in any criminal case or engaged in any form of unlawful activities. The worst part of the process is that apart from the character of the candidate,

the history of his family members is being searched which is unfair. About 400 meritorious young job seekers from the 32nd BCS to the 39th BCS Examination were denied final appointment letters despite being recommended by BPSC due to negative police reports. In many instances, the political affiliation of the candidate, his parents, and even his relatives is given special priority during the police verification. It is often seen that negative reports about the candidate are given by the police due to their minimal affiliation with any anti-government political party and even rumors about it. Besides, there are allegations of unethical practices like bribing to get a positive police report (Hossain 2020).

Complain regarding oral examination is another major issue to deal with as no specific guideline or manual has been followed for conducting the viva voce. The entire viva voce is influenced by the partisan effect. It is a common assumption that the roll numbers of the mentioned candidates are forwarded to the interview board chairman/member. The chairman of the viva boards is often advised by the external members of the boards to prevent awkward circumstances for the mentioned candidates. In general, the candidates mentioned are asked basic questions, while other candidates are asked critical questions (Karim 2007).

## Conclusion and Recommendations

The civil service of a country is a tool the government may use to convert its manifesto into results. To move the country toward its social and economic development objectives, Bangladesh needs a more effective and efficient civil service. Improving the performance of the civil service and more effectively using the latent talents of its officers are the keys to progress (World Bank 2006). And for this, Bangladesh firstly needs to recruit an eligible pool of civil servants. Therefore, reforming the BCS Examination is inevitable.

The number of BCS applicants is growing with time. The examination has become the first choice for the majority of job seekers in Bangladesh. However, due to the limited number of vacant posts and multiphases recruitment and selection systems in the civil service, a large number of aspirant candidates remain deprived. Reducing the time in evaluating the preliminary answer scripts, written scripts, oral examination, police verification, and medical checkup may accelerate the whole process in BCS, thereby saving time and money for the unemployed and others.

The examination needs to be designed in such a way that a candidate can prove his/her merit and hidden talent rather than merely memorizing guidebooks. To ensure quality and professionalism in the service, the existing generalized examination system should be replaced by cadre-specific examinations. Measures should be taken to ensure that any sort of nepotism and favoritism cannot influence recruitment.

The concerned authority must take precautionary measures to stop the leakage of questions along with ensuring exemplary punishment to the criminals so that no one can dare to repeat the crime once again. There is a complaint against the police verification report. In the recruitment of candidate applicants who have succeeded in the BCS test, the police verification process must be transparent, fair, and ethical. It needs to be ensured that except for criminal cases, no candidates should be denied the final notification of the job.

In the BCS Examination, BPSC does not take into consideration of previous academic achievements of the candidates. Past examination marks of the applicants may be taken into account while making the final list for the oral examination. In this way, BPSC can call a specific number of applicants for interviews, thus saving time. Besides, this can be an efficient measure to exclude less eligible candidates, thus eliminating the scope of corruption in the recruitment process.

At each stage of the civil service examination, there is scope for efficiency gains, including improving the way candidate documents are obtained and scrutinized, shortening the time between the preliminary and main written exams, having a question bank, promptly publishing examination results, improving examination venues and logistics, and offering higher fees for

those evaluating the scripts. Additionally, a team of local and external consultants could be involved in reviewing and updating existing examination processes. Finally, BPSC must be allowed to act as a neutral independent organization free of all political influences that are necessary to make an effective and efficient civil service for the country.

# Bankruptcy Risk and Political Connection in Indonesia

Iman Harymawan, Ardyan Kusuma Agung, Mohammad Nasih and Dian Agustia
Universitas Airlangga, Surabaya, Indonesia

## Synonyms

Altman Z-Score; Bankruptcy risk; Leverage; Political connections

## Definition

Prior research regarding bankruptcy risk suggests that there are several ways to mitigate the bankruptcy risk. If the firms can increase their productivity, use Porter's firm strategy, and use accounting conservatism, then the firm can reduce the bankruptcy risk and help to avoid from bankruptcy (Biddle et al. 2016; Bryan et al. 2013). However, whether the level of leverage of politically connected firms varies across firms and industries or not and how the firms leverage affect the relation between political connections and bankruptcy risk are remain unknown.

## Introduction

The purpose of this study is to further enhance our understanding on the motivation behind the firms being politically connected through the relation of political connections on the bankruptcy risk and firm leverage. Prior research find that the firms leverage has positive and significant relationship to bankruptcy risk (Bryan et al. 2013). Another research also find that political connections has positive and significant relationship to firm leverage (Bliss and Gul 2012; Faccio 2010).

One of the benefit of politically connected firms that can derived from their connections is preferential access to the loan (Cull and Xu 2005).

If the connected firms get the credit from the bank through their connections, this situation will increase the level of leverage which will also potentially increase the risk of bankruptcy. In this research, it is examined the relationship between political connections and bankruptcy risk and also the role of firm leverage that can affect this relation. First, predict that bankruptcy risk of politically connected firms higher than non-connected firms. Furthermore, extend the findings from prior research by investigating the effect of leverage level of politically connected firms to bankruptcy risk. It is expected that the different level of leverage, especially for politically connected firms have different level of bankruptcy risk due to different motivation of a firms on establishing political connections.

To investigate this issue, it is used the listed firms from Indonesia as our sample. Based on some major prior research on political connections study, Indonesia is a good setting to examine the value of political connections in business. Fisman (2001) finds that the politically connected firms are strongly rely on the benefits of their connections. Leuz and Oberholzer-Gee (2006) shows that politically connected firms face financial difficulties when they loss their connections.

In this study, it is used a sample of 882 year-firm observations from 294 firms listed in Indonesia Stock Exchange from period 2010–2012. This research uses Ordinary Least Square (OLS) regression method to empirically examine the relationship between political connections and firm leverage to bankruptcy risk. The results indicate that politically connected firms are more likely to have higher bankruptcy risk than non-connected ones. And also, this study finds that different level of leverage for politically connected firms have different level of bankruptcy risk. These results are robust after doing cluster method from Petersen (2009) by clustering from firm and year.

The results of this study are in line with the findings from Bliss and Gul (2012), Bryan et al. (2013), and Faccio (2010), which stated that political connections and bankruptcy have positive and significant relationship to the leverage. Hence, it can be concluded that because of the leverage level of politically connected firms are higher than non-connected firms, the bankruptcy risk for politically connected firms are also higher than non-connected firms.

The second issue that is investigated in this study is the relationship between levels of leverage for politically connected firms to the bankruptcy risk. It is examined that different level of leverage will result in different level of bankruptcy risk. Then, find that politically connected firms with high leverage significantly have low level of bankruptcy risk. In other hand, for politically connected firms with low level of leverage, they have high level of bankruptcy risk. This finding indicates that leverage become the important determinant to explain the relationship between political connections and bankruptcy risk. It argues that this condition happens due to different motivations of firm to be politically connected. The result of this study contributes to the literature by further enhance our understanding that firm leverage is one of important determinants to explain the motivation of a firm on establishing political connections.

The remainder of this paper is structured as follows. Section "Synonyms" outlines the literature review and develops the research hypotheses. Section "Introduction" describes the sample and variables. Section "Literature Review and Hypothesis Development" specifies the methods, empirical models, and presents the empirical results. Section "Data and Variable Measurement" summarizes the paper and presents concluding remarks.

## Literature Review and Hypothesis Development

Prior research regarding bankruptcy risk suggests that there are several ways to mitigate the bankruptcy risk. If the firms can increase their productivity, use Porter's firm strategy, and use accounting conservatism, then the firm can reduce

the bankruptcy risk and help to avoid from bankruptcy (Biddle et al. 2016; Bryan et al. 2013).

Prior studies show that leverage has positive relationship to the bankruptcy risk (Bryan et al. 2013; Seppa 2014). Seppa (2014) conducted the research regarding bankruptcy risk with the sample consists of 314 Estonian small firms. He finds that the use of inside-debt is positively and significantly related to the bankruptcy risk. In other research, Bryan et al. (2013) finds that leverage has negative relationship to the Altman Z-Score, which means that high leverage will have low Altman Z-Score (high bankruptcy risk).

Another stream of literature regarding political connections also finds that the firm can get several benefits from their connections. The benefits include higher chance to be bailed out by the government, preferential access to credit, easier to win the government's tender or contract, pay lower tax, and have strong market (Cull and Xu 2005; Faccio 2010; Faccio et al. 2006; Goldman et al. 2013; Johnson and Mitton 2003).

Results from international studies suggest that political connections are generally higher in the country that has higher levels of corruption. Faccio (2006) finds that the benefits of political connection are higher in countries that have high level of corruption, have less developed, strict regulation on foreign investment, and have transparent system. In different research, she found that the financial characteristics of politically connected firms have differ more than non-politically connected firms in the countries that categorized as high level of corruption.

The international studies also documented various findings related political connections. For developed countries, Goldman et al. (2009) show that the S&P500 Firms in United States that have politically connected on their board report a positive announcement effect and get positive and significant stock price response when politically connected S&P500 Firms announce the board nomination of politically connected individuals. But, in Australia, Gray et al. (2016) find that the directors from political and government connections have significantly lower market reaction than other directors and they are not valuable to shareholders in Australia.

Various result of research regarding political connections also found in developing countries. Harymawan and Nowland (2016) examined the relationship between political connections and earnings quality by using sample of 2073 firm-year observations from firms listed in Indonesia stock exchange. They found that the earnings quality of politically connected firms listed in Indonesia Stock Exchange increases as government effectiveness improves, but decreases as the political environment becomes more stable.

Fisman (2001) found that the connected firms in Indonesia have negative returns when they loss their connection as the effect of the rumor of Soeharto's health. This could be occurring because the politically connected firms in Soeharto's era are strongly relied on their connection. Also in Indonesia, Leuz and Oberholzer-Gee (2006) showed that politically connected firms will suffer and face financial difficulties when they loss their connection and hard to establish new connection to the new government.

Bliss and Gul (2012) conducted the research regarding political connections and leverage by using Malaysian top 500 nonfinance public-listed companies as their samples. The result shows that leverage to be positively and significantly associated with political connection, firm size, and property, plant, and equipment and to be negatively and significantly associated with return-on-assets.

Bryan et al. (2013) found that bankruptcy risk is positively associated with leverage. High leverage comes from easier access to credit, as one of the benefits for being politically connected firms. By having easier access to get loan for politically connected firms (Cull and Xu 2005), the politically connected firms will tend to borrow rather than do the other alternatives to get external financing to finance their operation and just rely on the credit (Faccio et al. 2006). If this condition persists, the leverage ratio for the firms will be higher than non-connected ones, which are not having preferential access to credit. Faccio (2010) and Bliss and Gul (2012) showed that the political connection has positive relationship to the leverage. It implies that the politically connected firms have higher leverage ratio than

nonpolitically connected firms. If a firm has high leverage ratio it will bring them to the bankruptcy. Therefore, it is proposed the hypothesis 1 as follows:

> Hypothesis 1: Firms with political connections have higher bankruptcy risk than non politically connected firms.

Although the politically connected firms are having higher leverage than non-connected firms, it is not always that the politically connected firms also have high bankruptcy risk. Based on the benefits that the firms can extract from their connections, the firms tend to borrow to get external funds. This funds can be used to do the expansion plan by getting the government tender (Goldman et al. 2013). Although the firms have high leverage, they expect that the contract is profitable and cover their financial problem. So, the firms can avoid the bankruptcy. In the other hand, although the leverage ratio of politically connected firms is low and the firms' plan is to avoid the high bankruptcy risk, then the firms use their connection to make the firms to be bailed out by government. Hence, it is expected that the politically connected firms have different level of bankruptcy risk because of their different level of leverage. The formal hypothesis 2 is as follows:

> Hypothesis 2: Politically connected firms with different level of leverage will have different level of bankruptcy risk.

## Data and Variable Measurement

### Sample and Data Sources

For this study, the sample consists of all firms listed in Indonesia Stock Exchange for period 2010–2012. All of financial data are obtained from Indonesian Stock Exchange (IDX) website. For sample selection, there are several criteria used in this study. First, excludes all of financial institution from this study due to different type of financial statement. Second, the companies should have published and audited financial statement for period 2010–2012 with fiscal year end in December. Third, the company has the necessary data and information related to the variables used in this study. From all of above criteria, it is obtained 882 firm-year observations from 294 listed companies as the main sample.

### Measurement of Bankruptcy Risk

This study uses Altman Z-Score to measure the bankruptcy risk in a firm. Altman (1968) introduced this bankruptcy evaluation model to differentiate between bankrupt and non-bankrupt firms. This model result will represent a firm's risk of bankruptcy. The Altman Z-Score model is as follows:

$$Z = 1.2\,(X_1) + 1.4\,(X_2) + 3.3\,(X_3) + 0.6\,(X_4) + 0.999\,(X_1)$$

Where:

$X_1$ = Working Capital divided with Total Assets
$X_2$ = Retained Earnings divided with Total Assets
$X_3$ = Earning Before Interests and Taxes divided with Total Assets
$X_4$ = Market Value of Equity divided with Total Liabilities
$X_5$ = Sales divided with Total Assets

$X_1$ will measure the liquidity of a firm. $X_2$ will measure firm's cumulative profitability and as a measurement of a firm's ability to finance their investment without external funds. $X_3$ will measure the firm's ability to generate profit with existing assets. $X_4$ will measure the leverage, and $X_5$ will measure the firm's ability to generate sales with the firm's assets. If the results are below 1.8, it means the firm has high risk to bankruptcy. If the result is between 1.8 and 2.99, the firm is in grey area, which means the firms have the risk of bankruptcy. If the result is higher than 2.99, the firms are in safe zone, which means the firms are less likely going to bankrupt. Therefore, high value of the score indicates that firms have a good financial condition (low bankruptcy risk).

### Measurement of Political Connection

This study also uses the data from Faccio (2006) to identify the firms with political connections.

According to her, a firm is defined as having political connection if:

> . . . at least one of its large shareholders (anyone controlling at least 10% of voting shares) or one of its top officers (CEO, president, vice-president, or secretary) is a member of parliament, a minister, or is closely related to a top politician or party. (Faccio 2006:370)

In this study, there are 23 firms that are matched with the data from Faccio (2006) for the firms that have political connections. This will leave 271 firms as non-politically connected firms. All of politically connected firms in our sample are connected through ownership or the directors by a minister, police officer, army, member of political parties, or someone related with them.

## Empirical Results

### Descriptive Statistics and Correlation

All variables definition used in this study are available in Appendix 1. Table 1 present the criteria for the sample selection in this study. The totals of firms listed in Indonesia Stock Exchange (IDX) are 442 firms as of 31 December 2011. There are several criteria that used for sample selection in this study. All of the criteria are described in the Table 1 below. After doing the sample selection based on those criteria, the firms used in this study are 294 firms listed in Indonesia Stock Exchange (IDX). With the firm-year for period 2010–2012, the total firm-year observations in this study are 882 Firm-Year observations.

**Bankruptcy Risk and Political Connection in Indonesia, Table 1** Sample selection

| | Total |
|---|---|
| Initial data of firms listed | 442 firms |
| Excluded: | |
| Financial institution | 111 |
| IPO in 2011 | 22 |
| Firms delisted in 2012 | 4 |
| Missing financial statement | 6 |
| Financial statement that are not ended in 31 December | 5 |
| Available observations per year | 294 firms |
| Final number of firm-year observations (3-year observations) | 882 year-firms |

This table shows the criteria for sample selection in this research. The samples from 294 firms listed in Indonesia Stock Exchange (IDX) for period 2010–2012

Table 2 represents the descriptive statistics for the variable used in this study. The mean of bankruptcy risk (*ZSCORE*) is 3.735 with the range of the values from −9.127 to 29.508. The mean value indicates that on average, the firms in this study are categorized as healthy firms and are not going to bankrupt. The average value of firm-size is around 5 trillion rupiah (Indonesian currency). The leverage ratio of the firm samples on average appears to have the debt of 0.552 to the total assets, which is calculated in *LEV* variable. The mean of *ROA* variable and *CASH* variable in this study are 0.048 and 0.106, respectively.

Table 3 represents the correlation coefficient and the significance level of correlation between the variables used in this study. The significance between variable is signed with star beside the correlation coefficient and below followed with the significance level. As expected, the correlation between *ZSCORE* and *PCON* is negative and significant indicating that politically connected firms are associated with high bankruptcy risk (low *ZSCORE*). The correlation between *PCON* and *LEV* is positive and significant. This correlation is in line with the findings from Faccio (2010) and Bliss and Gul (2012), which stated that politically connected firms have positive association with leverage.

Table 4 presents firm characteristics between politically connected and nonpolitically connected firms. This independent t-test used 882 year-firms as the samples to determine if there are differences between politically connected firms and nonpolitically connected firms. It is divided into two groups: connection and no connection groups, which has 69 and 813 firms-year observation, respectively. The results show that the mean of *ZSCORE* variable indicates that the politically connected firms have lower *ZSCORE* (higher bankruptcy risk) than nonpolitically connected firms. This indicates that the Altman Z-Score between politically connected firms and nonpolitically connected firms are significantly different. And also, based

on t-test result, this indicates that there are significant differences between politically connected firms and nonpolitically connected firms in terms of firm size, leverage ratio, and their return on assets. But, the result shows that there is no significant difference between politically connected and nonpolitically connected firms in terms of cash holding ratio. In other words, the politically connected firms have higher leverage, lower return on assets, larger in terms of firm size than nonpolitically connected firms, and no significant difference between them in terms of cash holding

ratio. This result is supporting the findings from Faccio (2010) and Bliss and Gul (2012), which stated that politically connected firms are have higher leverage than nonpolitically connected firms.

### Main Analysis

In this stage, empirical analysis of the relations on firms' bankruptcy risk, political connections, and firm leverage has been done. It analyzes two cases in this study. First is analyzing the differences of firms' bankruptcy risk level between politically connection and nonpolitically connected firms. Second, this study wants to investigate the bankruptcy risk of politically connected firms from the difference of leverage level of firms.

It uses Ordinary Least Square (OLS) with cluster model on testing the hypotheses. Regression model with ordinary least square (OLS) is the most common model of regression that is used in the research to analyze the relationship between dependent and independent variable. However, the likelihood to have heteroscedasticity and autocorrelation problem becomes the weakness of this model. Therefore, this study follows Petersen (2009) by clustering firm and year for estimating the regression model to make the output and the standard error for the regression model more robust.

#### Impact of Political Connections on Bankruptcy Risk

To test hypothesis 1, it is estimated the following regression model to evaluate the relationship between bankruptcy risk and political connections with several control variables as the determinant of bankruptcy risk and also industry and year fixed effect.

$$\begin{aligned} ZSCORE_{jt} = \beta_0 + \beta_1\, PCON_{jt} + \beta_2\, SIZE_{jt} \\ + \beta_3\, LEV_{jt} + \beta_4\, ROA_{jt} \\ + \beta_5\, CASH_{jt} + \beta_6\, INDUSTRY \\ + \beta_7\, YEAR + \varepsilon \end{aligned}$$

*ZSCORE* is the variable of Altman Z-Score for the measurement of bankruptcy risk. *PCON* is the variable of political connection of a firm. Following with prior research (Bliss and Gul 2012; Bryan et al. 2013; Campbell et al. 2008; Eberhart et al. 2008; Harymawan and Nowland 2016; Shumway 2001; Uhrig-Homburg 2005), there are several control variables used in this research. Those are leverage ratio (*LEV*) which calculated as ratio of total debt (short and long term liability) to total assets, firm size (*SIZE*) calculated by natural logarithm (Ln) of total assets, return on Assets (*ROA*) calculated as the ratio of net income for the current year to total assets, liquidity ratio (*CASH*) calculated as the ratio of cash holdings to total assets, and industry dummies are determined using SIC codes. Consist with prior research, it is expected that high level of bankruptcy risk (lower *ZSCORE*) to be associated with high leverage (*LEV*). Moreover, low level bankruptcy risk (higher *ZSCORE*) to be associated with big firm size (*SIZE*) and high liquidity (*CASH*).

Table 5 presents the result of the regression analysis of the bankruptcy risk (*ZSCORE*) on political connection. In line with the expectation, the coefficient of political connection (*PCON*) is negative and significant. The coefficient of *PCON* is −0.812, significant at 5 percent level with t-value is −2.44. The coefficient of *PCON* remains significant even after control (specification 1) or do not control (specification 2) industry and year fixed effects. This indicates that politically connected firms have lower score of Altman Z-Score than nonpolitically connected firms. This is consistent with hypothesis 1 and confirms that politically connected firms are more likely to have higher bankruptcy risk than nonpolitically connected firms.

The results for control variables are also consistent with the findings in the prior research and in line with the expectation. The coefficient of leverage (*LEV*) is negative and significant (coefficient = −3.775; *t*-statistics = −6.84). This relationship proves that the leverage is the important factors as the indicator of bankrupt risk. The coefficients of return on assets (*ROA*) and liquidity (*CASH*) are positive and significant (coefficient = 13.252; *t*-statistics = 7.16 for *ROA*; and coefficient = 8.233; *t*-statistics = 5.31 for *CASH* respectively). But, different with prior research, firm size is not the important factors as the indicator of bankruptcy risk. The result shows that the value of firm size (*SIZE*) is negative and

**Bankruptcy Risk and Political Connection in Indonesia, Table 5** Political connections and bankruptcy risk

| Variable | Predicted Sign | *ZSCORE* (1) | (2) |
|---|---|---|---|
| *PCON* | – | −0.812** | −0.694** |
| | | (−2.44) | (−2.17) |
| *SIZE* | + | −0.004 | −0.041 |
| | | (−0.04) | (−0.50) |
| *LEV* | – | −3.775*** | −3.798*** |
| | | (−6.84) | (−6.71) |
| *ROA* | ? | 13.252*** | 13.619*** |
| | | (7.16) | (7.59) |
| *CASH* | + | 8.233*** | 7.553*** |
| | | (5.31) | (5.04) |
| *INTERCEPT* | ? | 6.565** | 5.592** |
| | | (2.11) | (2.30) |
| Industry dummies | | Included | Not included |
| Year dummies | | Included | Not included |
| R-squared | | 0.411 | 0.395 |
| N | | 882 | 882 |

First regression model relate the bankruptcy risk to political connections and firm-specific control variables. The dependent variable is *ZSCORE* The samples from 294 firms listed in Indonesia Stock Exchange (IDX) for period 2010–2012. Standard errors are clustered by firm and year. t-statistics are in parentheses. Significance level at * 10 percent, ** 5 percent, *** 1 percent

insignificant, flip with previous research. This regression result indicates that firm with high leverage ratio have high level bankruptcy risk (low *ZSCORE*) and firms with high liquidity and return on assets have low bankruptcy risk (high *ZSCORE*), no matter how big the firm it is. Overall, the result confirms the Hypothesis 1 that political connections has predictive effect on bankruptcy risk and politically connected firm have higher bankruptcy risk (lower *ZSCORE*) than nonpolitically connected firms.

### Political Connections, Bankruptcy Risk, and Leverage

To examine hypothesis 2, it is estimated the following regression model to investigate the effect of different level of leverage in politically connected firms to the bankruptcy risk. The new variable, *PCON*LEV*, is the interaction variable between politically connection and leverage ratio. *PCON*LEV* is dummy variable. *PCON*LEV* is equal to 1, if the politically connected firm has leverage ratio above the median. Vice versa, *PCON*LEV* is equal to 0 if the politically connected firm has leverage ratio below the median. This regression model uses the same control variables and also uses industry and year fixed effects.

$$ZSCORE_{jt} = \beta 0 + \beta 1\ PCON_{jt} + \beta 2\ PCON^{*}LEV_{jt} + \beta 3\ SIZE_{jt} + \beta 4\ LEV_{jt} + \beta 5\ ROA_{jt} + \beta 6\ CASH_{jt} + \beta 7\ INDUSTRY + \beta 8\ YEAR + \varepsilon$$

Table 6 presents the results of the regressions of bankruptcy risk on political connections and leverage ratio. In this model, the interested variable is the interaction between political connection and leverage ratio (*PCON*LEV*). The result shows that the coefficient of *PCON*LEV* is 1.523, significant at 1 percent level (t = 2.91). This indicates that the politically connected firms with high leverage ratio relatively have higher Altman Z-Score (lower bankruptcy risk) than politically connected firms with low leverage ratio and

| Year dummies | | Included | Not included |
| R-squared | | 0.413 | 0.397 |
| N | | 882 | 882 |

Second regression model relate the bankruptcy risk to political connections, leverage and firm-specific control variables. The dependent variable is *ZSCORE*. The samples from 294 firms listed in Indonesia Stock Exchange (IDX) for period 2010–2012. Standard errors are clustered by firm and year. t-statistics are in parentheses. Significance level at * 10 percent, ** 5 percent, *** 1 percent

nonpolitically connected firms. This results shows that the different level of leverage for politically connected firms have different level of bankruptcy risk. It has obtained consistent results in both specification of control or do not control the industry and year fixed effects.

For politically connected firms with high leverage, it does not mean that the firm will go bankrupt. For Indonesia case, by having political connection, although it has high leverage, in the result shows that the firms tend to have low level of bankruptcy. This phenomenon can occur because of the benefit from being politically connected. There are several benefits for the firms to be politically connected. For example, if the firm wants to expand their business, they will need more money to do so. Then, by having political connection, they hire politician as their board of directors to make their expansion plan on the track. The first benefit, the firm will use their political connection to easily get preferential access credit from the external sources (Cull and Xu 2005; Faccio et al. 2006). After the firm has enough money, they will also use their political connection to easily get the contract or tender from government (Goldman et al. 2013). Although this plan will make the firm become having high leverage, but because of their connections, they will easily get credit to cover the cost of contract and expect that the government contract is profitable and from that contract, they can expand their business without worrying about their financial condition, which has been covered from that tender. Hence, because of this motivation, the firms can avoid the bankruptcy. Another example, if the firms are in export-import sectors, by having political connection, they will easily get export-import license. This license will make them easier to do their business and make the firm avoid the bankruptcy.

In the other hand, based on the regression results, the politically connected firms with low level of leverage have high level of bankruptcy risk. This can be caused by the motivation of firms

to be politically connected. For Indonesia's case in this study, politically connected firms with low level of leverage tend to hire the politician and use their connections to improve the performance of their finances. The motivation is to avoid the bankruptcy and use their connection to get easier access to loan. Different from the high-leverage firms that use the political connections to expand their business, the low one will only concern about the preventive action to avoid the bankruptcy, so they become politically connected firms. And also, another reason why they become politically connected is they want to be bailed out by government if they cannot repay their debt to avoid the bankruptcy. Faccio (2006) stated that one of the benefits of political connections is the firm can be bailed out by government. Because of the politically connected firms with low leverage have high bankruptcy risk, they want to be bailed out by government to reduce the risk of bankruptcy and make their finances back into good condition.

Based on two regression analyses above, the results show that the leverage is the important factors as indicator for bankruptcy risk, especially for politically connected firms. In the first analysis, the results is supporting the findings from Faccio (2010) and Bliss and Gul (2012), which stated that politically connected firms have higher leverage than non-connected firms. Because having high leverage, the bankruptcy risk of politically connected firms is also higher than non-connected firms. But, it is not always that all of politically connected firms are having high bankruptcy risk because of their high leverage. The second analysis proves that for politically connected firms, although they have high leverage, relatively they have lower bankruptcy risk than politically connected firms with low leverage and non-connected firms. This can be caused from different motivation of firms to be politically connected. They can get the benefit from their connections, for example, to be bailed out by government (Faccio et al. 2006) for politically connected firms with low leverage to avoid the bankruptcy, get preferential access to credit (Cull and Xu 2005), and easily get the government contacts (Goldman et al. 2013) for politically connected firms with high leverage for their expansion planning.

From all these regression models above, it is found that the VIF in the estimation are in the acceptable levels. VIF score for the first and second regression are 2.46 and 2.59, respectively. Therefore, the VIF score indicate that there are no multicollinearity problems in this research. It also addresses the heteroscedasticity and autocorrelation problem by using clustering model from Petersen (2009). All of those two regressions analyses use cluster by firm and year for estimating the regression model. This clustering model also makes the standard error of the regression model become robust. So, the output and the data of the analysis are robust for all of regression model.

### Additional Tests

Since the firms can choose either to be politically connected or not (endogenous), there are some potential of endogeneity problem in this research. First, it is possible that observed variables (for this study: *SIZE, LEV, ROA, and CASH*) are the source of the relation between political connections (*PCON*) and bankruptcy risk (*ZSCORE*). If that is the case, the results of the main findings could be bias. To deal with this issue, it is proposed the method suggested by DeFond et al. (2016) by using Coarsened Exact Matching (CEM) approach. (Please see DeFond et al. (2016) for the detail discussion.) Under this method, it will select matching samples (control sample) of political connections sample (treated sample) based on coarsened range (or strata) of covariates. Based on this approach, it is found 55 treated samples matched to 199 control samples (254 firms-year observations). Then, from this sample it re-examines the hypotheses.

Table 7 Specifications (1) and (2) present the results using CEM method. The results of Specification (1) show that the coefficient of *PCON* is −0.889 and significant in 1% of significant level (*t*-value is −2.82). In Specification (2), the results show that the coefficient of *PCON* is −1.839 and significant in 1% level. With respect to *PCON*LEV,* the results show that the coefficient is 1.548 and significant in 1% level. Overall the results support the main findings of this study.

Second, it is possible that the unobserved variables of characteristics of individual directors are correlated to both dependent and political connections variables. If this is the case, the results from this study could potentially subject to self-selection bias problem. One appropriate approach to address this issue is Heckman 2-Stages Least Square (Heckman 1979). As the second additional test, conduct Heckman test presented in Table 7 on Specification (3) and (4). Lennox et al. (2012) suggest to add 1 variable which theoretically will affect bankruptcy risk only through its effects on political connections in the first stage regression. Follow Kim and Zhang (2016) by adding variable using industry percentage of Connected Firms, namely, *PROBPC.* Therefore, in the first stage regression, estimating *PCON* is a function of *SIZE, ROA, CASH,* and *PROBPC.* In the first regression (unreported results), it is found the coefficient of *PROBPC* is 0.470 and significant in 1 percent level (*t*-value is 12.26). As the expectation, the probability of being politically connected is also driven by industry information. From this results, then calculate the inverse mills ratio (*MILLS*) to be included in the second stage of regression.

As it can be seen from Table 7 Specification (3), it is figured that political connection (*PCON*) has negative and significant association to bankruptcy risk. In Specification (4), it is found that for connected firms with lower level of leverage, the association between political connections (*PCON*) and bankruptcy risk is negative and significant. With respect to firms with high level of leverage (*PCON*LEV*), find that the association between political connections and bankruptcy risk is positive and significant. In not tabulated results, it is also found consistent findings in the second stage of regression when drop either *SIZE, ROA,* or *CASH* variable in the first stage regression. To summarize, the results presented in the main findings are robust from several endogeneity issues (observed and unobserved).

## Conclusion

Prior literature indicates that leverage is positively and significantly related to the bankruptcy risk (Bryan et al. 2013) and political connections (Bliss and Gul 2012; Faccio 2010). This relationship indicates that politically connected firms have higher leverage than nonpolitically connected firms. Because of high leverage, the bankruptcy risk of politically connected firms will be higher than nonpolitically connected firms. This paper investigates the relationship between political connection in business and bankruptcy risk. This paper also investigates the role of leverage, especially for politically connected firm, that can affect this relationship.

Using the data of politically connected firms from Faccio (2006) to measure political connections and Altman Z-Score developed by Altman (1968) to measure bankruptcy risk, it shows that political connections have negative and significant relationship with Altman Z-Score. Consistent with prior findings, this result indicates that politically connected firms are more likely to have higher bankruptcy risk than nonpolitically connected firms. Furthermore, it extends the issue by investigating the effect of firm leverage on the relation between political connections and bankruptcy risk. It is examined whether different level of leverage of connected firms will result in different level of bankruptcy risk. It is found that politically connected firms with high leverage significantly have lower bankruptcy risk than non-connected ones. In contrast, it is also found that politically connected firms with low leverage level significantly have higher bankruptcy risk than non-connected ones. The findings of this study indicate that firm leverage is one important determinant to explain the relation between political connections and bankruptcy risk. It argues that this is due to different motivation of a firm on being politically connected firms.

Future research should continue to examine the effect of political connections not only in the board and ownership comes from politician but also from the other type of connections which indirectly connect the firms to the politicians. It is expected that the results from this study are useful for stakeholders to analyze the bankruptcy risk and for future research in other emerging markets around the world.

# Benefits and Wages in Nonprofit Organizations

Jiahuan Lu
School of Public Affairs and Administration, Rutgers University-Newark, Newark, NJ, USA

## Synonyms

Employee benefits; Employee compensations

## Definition

Wage: monetary compensation paid by an employer to an employee in exchange for the employee's work.
Benefits: nonmonetary compensation provided by an employer to an employee in addition to the normal wage, such as retirement benefits, sick leave, social security, and tuition reimbursement.

## Introduction

The study of employee compensations in nonprofit organizations always proceeds through comparison with for-profit organizations. Indeed, many industries operate in a mixed-sector market, with nonprofit and for-profit organizations being two predominant players. This is particularly the case in service industries, where services are mostly provided by nonprofit and for-profit organizations, with limited involvement of public organizations. For example, in the United States, citizens generally receive various social services such as child care and employment training from either nonprofit or for-profit providers. Given that, the comparison between nonprofit and for-profit organizations offers interesting implications. Clearly, these two types of organizations differ in a variety of ways such as rationale for existence, organizational goal, and operational logic. However, how these differences shape organizational outputs

and outcomes has been a lingering question for scholars and practitioners.

This entry explores the compensation differential between nonprofit and for-profit organizations. It addresses three major questions: (1) why there is a compensation differential across sectors, (2) what might the relationship between wages and benefits in nonprofit organizations be, and (3) what constitutes an appropriate method to study cross-sector compensation differentials. The first question is the major focus of the entry, because it lays the foundation for later discussion.

## Why Does a Cross-Sector Compensation Differential Exist?

Basically, there are two competing lines of reasoning to account for the compensation differential between nonprofit and for-profit organizations. Let us hold an economic lens to consider that an individual's compensations in the labor market are determined by both the supply and the demand sides of the market. The labor supply side examines how individual characteristics affect one's compensations, and the labor demand side looks at how employer demand shapes employee compensations. In this way, there are two competing strands of arguments that shed light on the discussion on nonprofit and for-profit compensation differential: labor donation hypothesis and property rights hypothesis.

### Labor Donation Hypothesis

The labor donation line suggests that employees are willing to accept lower compensations in exchange for the chance to work in nonprofits in order to advance social benefits. This labor donation hypothesis rests upon a long-standing assumption that nonprofit employees are more intrinsically motivated by the work and self-fulfillment, while for-profit ones are more extrinsically motivated by material gratification and advancement. Conceptually, intrinsic motivation refers to engaging in an activity for the inherent enjoyment and satisfaction of the activity itself, while extrinsic motivation considers performing an activity due to its instrumental value toward separable outcomes such as rewards and income. Comparatively speaking, intrinsic motivation could result in greater psychological well-being and better behavioral outcomes (Ryan and Deci 2000). Holding this analytical lens, nonprofit workers are found to be with stronger intrinsic motivation and thus are highly self-motivated. For example, Lyons et al. (2006) noted that nonprofit employees value contribution to society more and opportunities for personal advancement less, when compared to their for-profit counterparts.

Based on the finding of intrinsic motivation, intrinsically motivated individuals may accept lower compensations in exchange for intrinsic values and self-satisfaction from work. In this way, the compensation level in nonprofit organizations would be lower than the one in for-profit organizations. This phenomenon is termed by Preston (1989) as the labor donation where "workers supply labor to nonprofit organizations at lower than market wages in return for the opportunity to provide goods with positive social externalities" (p. 438). In the meanwhile, nonprofit organizations may also intentionally set their compensation level below the for-profit level, as a screening mechanism to identify individuals with stronger commitment to nonprofit mission rather than financial gains (Handy and Katz 1998). As such, intrinsically motivated individuals could self-select themselves to work for nonprofit organizations rather than for-profit ones. By contrast, when extrinsically motivated individuals choose to work for for-profit organizations, the divergence between employee motivation and the cause of the organizations has to be made up by compensation differentials such as higher wages and/or more benefits. To support this labor donation argument, Gregg et al. (2011) found, for example, nonprofit employees are even more willing to work unpaid overtime than for-profit employees. In sum, the labor donation hypothesis posits:

**$H_1$**: Because of their stronger intrinsic motivation, nonprofit employees accept lower compensations than for-profit counterparts.

### Property Rights Hypothesis

On the other hand, there is also good reason to believe that nonprofit organizations may overpay their employees. This demand line of analysis is represented by the property rights hypothesis, which suggests that attenuated property rights in nonprofit organizations lead to weaker incentive to cost minimization in organizational management, causing nonprofit compensations higher than the for-profit level. This property rights line of reasoning starts with an assumption about lower operational efficiency in nonprofit organizations due to nonprofits' attenuated property rights. Unlike for-profit organizations, nonprofits operate in a unique market niche where they do not have pressures to maximize their profits and to be strictly oversighted by stakeholders. In for-profit organizations, the central focus on profit leads to that the outcome of any organizational behavior can be clearly specified and thus has a financial bottom line. In contrast, in nonprofit organizations their organizational goals – to create social value and advance social mission – are always too broad to be captured clearly. When organizational objectives cannot be specified clearly, the incentive structures associated with the objectives would be less efficient. Further, the nondistribution limit in nonprofit organizations makes that no one has a legal claim for residual earnings, leading to that the property rights in nonprofit organizations are often unclear. In most cases, there is no simple answer to a seemingly simple question: who owns a nonprofit organization? All these issues complicate nonprofit management, resulting in more severe agency problems and weaker incentive of efficient management. For example, DeVaro and Brookshire (2007) reported that nonprofit employers are less likely to offer financial incentives such as merit-based promotions and output-based incentives.

Along with weaker incentive of efficient management and thus lower operational efficiency in nonprofit organizations, there is higher chance of managerial shirking in nonprofit management. Nonprofit employers have weaker incentive about cost minimization since any financial surplus would not be distributed among organizational members. Rather, employers may even receive utility (such as pleasant work environment and low staff turnover) from overpaying their workers. Again, nonprofit employers may try to make up their shortages in financial incentives by overpaying their employees. In this way, compensation overpayment could be a charitable act to protect nonprofit employees. Preston (1988) called this utility-maximization line of explanation as "the property rights hypothesis." To support this property rights explanation, Mocan and Tekin (2003) found that even though teachers in nonprofit childcare centers are more willing to donate labor, they actually enjoy wage and benefit premium. In sum, the property rights hypothesis posits:

**$H_2$**: Because of lower operational efficiency in nonprofit organizations, nonprofit employees receive higher compensations than for-profit counterparts.

Overall, there are two different explanations for the compensation differential across nonprofit and for-profit organizations. As can be seen above, the two lines of reasoning are built upon different units of analysis, assumptions, and causal mechanisms. Indeed, both lines sound plausible and are supported by empirical evidence. As Preston (1989) summarized, "because the nonprofit wage differential is a result of two opposing forces ([1] demand, or managerial discretion in imperfect markets to pay higher wages; and [2] supply, or workers accepting lower wages to help generate social benefits), its sign is theoretically ambiguous" (p. 443).

## What Is the Relationship Between Wages and Benefits in Nonprofit Organizations?

The previous discussion treats compensations in nonprofit organizations as a whole, without differentiating between wages and benefits. Actually, employee compensations can be broadly divided into two categories: monetary and nonmonetary compensations. Conceptually, wage is monetary

compensation paid by an employer to an employee in exchange for work. In addition to their wages, employees usually receive various nonmonetary compensations such as retirement benefits, sick leave, social security, and tuition reimbursement. These nonwage compensations are usually referred to as fringe benefits. In nonprofit organizations, the relationship between wages and benefits is not well understood. Literally, the interaction between wages and benefits in nonprofit organizations might proceed with two directions.

### Negative Association

The negative association view treats wages and benefits as complementarity. This "negative" view can be justified by the labor donation hypothesis discussed above. Following the labor donation line of reasoning, nonprofit employees may be willing to accept lower wages to grasp the chance to serve social benefits through working for nonprofit organizations. Nonprofit employers may also use lower wages to attract intrinsically motivated individuals. However, to make up the shortage in wages, employers might offer better benefit packages to their employees. In this way, the shortage in wages would be compensated by the generosity in benefits, making the total compensation packages in nonprofit organizations comparable to the ones in for-profit organizations. Therefore, this negative association thinking would suggest lower wages but more benefits in nonprofit organizations. As such, this negative line of argument would posit:

**$H_3$**: Nonprofit employees receive lower wages but more benefits than for-profit counterparts.

### Positive Association

This positive association view considers wages and benefits as partners. This "positive" view can be justified using the both lines of reasoning discussed above. From the labor donation perspective, since individuals are willing to donate their labor for the causes they cherish, nonprofit organizations could offer lower wages and less benefits to their employees than for-profit organizations. From the property rights perspective, if nonprofit employers overcompensate their employees because of their lower operating efficiency, nonprofit employees could receive higher wages and more benefits than their for-profit peers. Therefore, in either line of reasoning, there is a positive association between wages and benefits in nonprofit organizations. In this way, this positive association view would lead to a cross-sector differential in total compensation packages. Accordingly, this positive line of argument would posit:

**$H_{4a}$**: Nonprofit employees receive higher wages and more benefits than for-profit counterparts.

**$H_{4b}$**: Nonprofit employees receive lower wages and less benefits than for-profit counterparts.

## What Constitutes an Appropriate Method to Explore Cross-Sector Compensation Differentials?

The discussion above proposes a number of research hypotheses on the cross-sector compensation differential between nonprofit and for-profit organizations. Although all these hypotheses are built on theoretical reasoning and supported by available empirical evidence, we still have limited understanding on the wages and benefits in nonprofit organizations compared with for-profit organizations. To better test these hypotheses to advance our knowledge in these regards, we need careful research designs. Arguably, empirical studies exploring cross-sector compensation differentials have to overcome three methodological challenges, that is, selection bias, confounding factors, and causality.

First, statistical analysis of compensation differentials in nonprofit and for-profit organizations is disturbed by endogeneity, because individuals with different traits would self-select themselves into the two sectors. For example, people with more intrinsic motivation are more likely to choose to work for nonprofit organizations to advance social value. In this way, individual characteristics that affect their sectoral choices may also effect employee behaviors, making employees in the two sectors systematically different. This endogeneity issue would be a particular concern in observational studies where

data are generated by mechanisms other than a randomized experiment. Thus, without appropriate corrections of endogeneity, selection bias would lead to the parameter estimates from regular regression models with a sectoral dummy variable inconsistent and biased. To solve the endogeneity problem in observational studies, researchers might consider more advanced statistical methods like Heckman selection model and sample matching.

Second, an unbiased estimate of compensation differentials across sectors also depends on a comprehensive control for relevant confounding factors at demographic, occupational, organizational, and environmental levels. Indeed, to fully control for all relevant factors seems extremely challenging in most observational studies. In this way, many existing studies have been criticized to be biased because they fail to sufficiently control for important confounding factors. Without including those controls into the analysis, employees in the two sectors are less comparable, which would make the analysis biased (Leete 2006). To facilitate future research, a list of potential confounding factors is provided below. Researchers should note that this list is not exhaustive, just for demonstration purposes only.

- Demographic factors: gender, age, race, marital status, education, etc.
- Occupational factors: professional experience, full-time or part-time status, working load, professional qualification, etc.
- Organizational factor: organizational size, organizational age, government regulation, staff turnover, etc.
- Industrial factors: service field, interorganizational competition, market concentration, etc.
- Socioeconomic factors: labor market, population density, population size, geographic location, etc.

Third, to better understand the compensation differentials between the two sectors, we need to test the causal mechanisms underlying the labor donation and the property rights hypotheses. The labor donation hypothesis is built on the mechanism that intrinsically motivated individuals tend to accept lower compensations in nonprofit organizations for the chance to advance social benefits. In contrast, the property rights hypothesis is dependent on the mechanism that lower efficiency in nonprofit organizations leads employers to overcompensate their employees. Future research should take a step to directly test these two causal mechanisms. Unfortunately, most observational studies are not well prepared to explore causality. Future research should consider employing experimental designs.

## Conclusion

In conclusion, this entry explores the wages and benefits in nonprofit organizations through comparing with for-profit organizations. In particular, the entry discusses three issues. First, it delineates why there is a compensation differential between the two types of organizations. Second, it digs deeper into compensation packages in nonprofit organizations and describes the possible relationships between wages and benefits. Finally, it demonstrates the methodological challenges in comparing nonprofit and for-profit compensations and provides some hints. Overall, our existing knowledge concerning wages and benefits in nonprofit organizations is still limited and awaits advancement by future studies.

# Best Practice Versus a Diagnostic Approach to Public Service Reform: The Malaysian Experience

Noore Alam Siddiquee[1] and John Antony Xavier[2]
[1]College of Business, Government and Law, Flinders University, Adelaide, Australia
[2]Graduate School of Business, National University of Malaysia, Bangi, Selangor, Malaysia

## Synonyms

Administrative reform; Best practice solutions; Problem-solving approach; Public management reform; Public sector reform

## Definitions

Best practice reforms are those believed to be effective at delivering results and have already produced best outcomes elsewhere. They can therefore be used as exemplars of successful reform. Diagnostic reform refers to a problem-oriented approach that rejects universal solutions and places emphasis on identifying and fixing problems in a given context.

## Introduction

Public service reforms are commonplace in developing countries. They seek to improve governmental performance and deliver public services in tune with popular expectations. Despite proliferation of reform initiatives, cases of successful reform are few and far between. In fact, much of the recent evidence points to the failure of reform programs (see, World Bank 2008). While existing theories make competing claims, empirical work on successful reforms remains scarce. Consequently, what makes reforms work and why have been among the intriguing questions to those interested in public service reform in developing countries. This entry attempts to answer these questions by analyzing Malaysia's public service reform experience.

Malaysia is among a few developing countries that have introduced significant and sustained reforms to enhance governance and achieve national developmental goals. By and large, these reforms are transplants of "best practices" from abroad. Most reforms are public service improvement initiatives across the government, designed and implemented in a top-down fashion. However, the launch of the Government Transformation Program (GTP) in 2009 signaled a shift in the reform process. Modeled on the UK's Performance Management Delivery Unit, the GTP is diagnostic in nature. It is focused on producing improvements in selected areas of public service, as opposed to the public sector as a whole. Together with its unique methods of implementation, the GTP represents a new approach to public service reform. This entry reviews Malaysia's reform experience to answer the following questions: Does the current "diagnostic approach" have a better record of performance compared to the conventional reform models? What lessons does the Malaysian experience offer on public service reforms generally? It draws on information gathered from both primary and secondary sources. In addition to a review of policy documents, data were collected through a series of in-depth interviews and open-ended discussions with selected government officials, academics,

and professionals in West Malaysia during July 2013 to January 2014.

## Best Practice Versus a Diagnostic Approach to Public Service Reform

Academic literature on public service reform has traditionally been dominated by two major perspectives: the top-down approach and bottom-up approach to reform. Under the top-down model, those in authority play a central role in the identification, selection, and implementation of reform programs. Given that reforms are conceived and executed by power holders, e.g., politicians and senior bureaucrats, this model is elitist in nature. It provides the ordinary citizens or the rank and file members with little or no say in the reform process. In contrast, the bottom-up model holds that reforms are essentially governmental responses to environmental pressures – political, economic, social, and administrative. It places the citizens in the driver's seat – allowing them to set reform priorities and directions (McCourt 2012).

More recently discussions have focused on explaining reasons behind the limited success of reform programs. Diagnosis shows that often reforms fail due to lack of political support and bureaucratic resistance. Poor design and implementation, limited capacity and resources, lack of champions, and inadequate involvement of key stakeholders (see, Brinkerhoff and Crosby 2002) are among the other significant factors that explain reform failures. Given their service-wide application, reforms often sucked in bucket of resources but produced limited results.

Two distinct approaches to reform have been identified: the "best practice" approach and the "best fit" approach (World Bank 2012; Levy 2015). Under the best practice model, governments adopt models of public service reform that have produced results elsewhere (Pal and Clark 2013). Often developing countries imitate – wittingly or unwittingly – reform models developed in advanced nations. They seek to make similar gains by introducing similar administrative institutions and practices. While this is nothing new, the process has accelerated especially since the advent of the New Public Management (NPM) in the 1980s. The NPM has come to be seen as a framework of general applicability: "public management for all seasons" (Hood 1991, p. 8). It is peddled as a panacea to many of the perennial problems afflicting public bureaucracy, as well as a strategy for enhancing the quality and efficiency of the public sector. Its perceived capacity to revitalize the public sector based on market principles coupled with its aggressive implementation in developing countries under the influence of aid donor has made the NPM a text-book example of the "best practice" approach (Xavier et al. 2016).

The best practice approach has its flaws. (i) It is based on an assumption that "one-size-fits-all" that ideas and practices are transferable from one country to another. However, what works in one jurisdiction may not necessarily work in another due to contextual differences. (ii) It focuses primarily on the reform content to the virtual neglect of the wider context in which reform is implemented. Rarely, it asks the question if the reform fits into the institutional and cultural milieu of the host country. (iii) The best practice historically entails transfer or extrapolation of neoliberal recipes that have produced questionable results (Pal and Clark 2013).

Such weaknesses reinforced by lackluster performance of so-called best practice models in other contexts have led to an alternative – referred to as "best fit" or "good fit" model. It is increasingly seen as an approach that considerably enhances the prospects of reform success. Even the World Bank and IMF – the traditional champions of the "best practice" model now consider such alternatives as preferred approaches to public sector reform. A recent World Bank document has signaled this shift by suggesting that it would move away from solely focusing on reform content to broader concerns that include reform context and the process in which it should be implemented (World Bank 2012).

The "best fit" model adopts a "diagnostic approach" to problem solving. It seeks to base reform design on empirical evidence gathered from the ground and focuses precisely on where shoe pinches the most. That is, it takes the context

seriously. Unlike the "best practice" approach, a diagnostic approach focuses on identifying problems in a given environment and concentrates on fixing them. It advocates local stakeholder engagement, viewing it as a critical element for ensuring the ownership and its sustainability.

This entry uses the best-practice versus diagnostic models as a framework of analysis. In particular, it tests the argument that the so-called "best practice" is a weak basis for reform as it is not specific to the service delivery problem that it is intended to redress. Reforms that are diagnostic and problem-solving in nature have a better grounding in the specific context to which they relate and therefore stand a better chance of success (Xavier 2013).

## Public Service Reform in Malaysia

Since the 1960s, Malaysia has seen wide variety of reforms aimed at improving public services. The 1966 Montgomery-Esman Report marked the beginning of a top-down reform process and set the tone of reforms for next two decades. One of the most significant reforms was the Program and Performance Budgeting System (PPBS) introduced in 1968. The PPBS took the public sector away from the traditional line-item budgeting – a colonial legacy – that had dominated the landscape of public budgeting in Malaysia. A new phase of public-service reform began following the rise of Dr. Mahathir at the helm of power in 1981. Throughout the 1980s and 1990s, Dr. Mahathir personally spearheaded reforms that covered virtually every aspect of the public service management. His personal interest combined with the influence of contemporary reforms under the NPM saw the introduction of institutional restructuring, service charters and one-stop shops, personnel and public financial management reforms, and the application of ICT in the public sector. Inspired by the Thatcherite and Reaganite belief in free markets, Malaysia adopted privatization in its various forms. State enterprises were converted into corporatized entities making them operate along private sector principles. The Malaysia Inc. policy created platforms that allowed government officials to work with the private sector to resolve issues that hamper growth of business.

Public budgeting and human resource management witnessed significant reforms. The Modified Budgeting System (MBS) was introduced in 1989 in an attempt to revitalize performance aspects of public budgeting by aligning it with contemporary budgetary reforms elsewhere. The New Remuneration System (NRS) introduced in 1992 was an attempt to replicate the UK and New Zealand models of pay reform. It aimed at linking pay with performance and offered accelerated increments to public servants who performed exceptionally well. Combined with the new appraisal system designed to facilitate a more objective evaluation of one's performance, the NRS marked a shift towards greater meritocracy and performance management in the public sector.

The productivity improvement initiative launched in 1991 was followed by the adoption of Total Quality Management (TQM) in 1992. The TQM emphasized the importance of quality control, results, and customer orientation in public service delivery. Drawing on the UK's Citizens Charter, Malaysia introduced Clients' Charter in 1993. The Charter committed the public service to a set of publicly documented standards of service provision. To further build on service quality, the government agencies have since 1996 been made to pursue the MS ISO 9001 certification and the subsequent versions. Another milestone in service delivery reform is the introduction of e-government in 1996. Numerous initiatives implemented during the past two decades helped make much of the public services available online**.** Benchmarking introduced in 1999 represents another major drive for improving service delivery. It requires agencies to emulate local and overseas best practices of service delivery and management.

The Abdullah Badawi government (2003–2008) placed greater emphasis on performance management. The 2005 Key Performance Initiative (KPI) initiative of the Malaysian Administrative Modernisation and Management Planning Unit (MAMPU) requires the agencies to develop KPIs to measure the quality of their service

delivery. The KPI system was further strengthened with the introduction of star rating by Auditor General's Office and MAMPU in 2006 and 2007, respectively. The five-star rating assessed a ministry's performance from poor, warranting only one star, to excellent and deserving five stars. Additionally, Badawi instituted a joint committee comprising public- and private-sector participation to cut red-tape and support the ease of doing business.

Public management reform in Malaysia received a fresh spurt under the current prime minister Najib Tun Razak who assumed power in 2009. Najib came to office amid rising public frustrations with the quality of governance and service delivery. This prompted him to seek public opinion and introduce the GTP, a program that drew heavily on the UK's service delivery reform under the Blair administration. The GTP entails the government targeting seven National Key Result Areas (NKRAs) – education, corruption, urban transportation, rural infrastructure, cost of living, crime, poverty – that needed urgent redress. Each NKRA was assigned measurable outcomes and performance targets. Lead ministries were identified for each NKRA to achieve national performance targets; other ministries were also assigned performance targets in their respective jurisdictions. A Performance Management and Delivery Unit (PEMANDU) was established within the Prime Minister's Office to drive the implementation of the GTP.

## Reform Results: Evidence on Selected Reforms

The varied nature of Malaysia's reforms and the patchy evidence of their progress makes it difficult to make a detailed assessment of impacts and outcomes. Therefore, this entry focuses on public budgeting, personnel management, and service delivery reforms.

As best-practice models, Malaysia's budgetary reforms like the PPBS and MBS have received acclaim as an exemplar of performance budgeting. However, evidence suggests that these have performed poorly. Though budgetary reform was to make a shift away from line item details, they still remained the center-piece of Treasury's budget review. Many of the key elements of performance budgeting still remained at infancy, even after more than two decades of experimentation (Siddiquee 2010). Though outcomes evaluation received a boost under the PPBS and MBS, measurement and reporting by line agencies was overly output focused. Outcomes and impact measurement remained rudimentary and of limited use to parliament, budget review officers, and even line managers. And there was no explicit link between performance and the budget, a link much touted by performance budgeting.

Likewise, the record of personnel management reforms has been equally wanting. While the NRS was aimed at promoting meritocracy in the public service, it had no bearing on Malaysia' affirmative policy which reserves 80% of public service positions for *Bumiputeras*. This is seen as a drag on efficiency and an impediment to attract the best and brightest in the public service. The NRS was opposed by most public servants for being subjective and biased especially the new methods of performance assessment. This combined with pressures from the unions prompted the introduction of the Malaysian Remuneration System (MRS) in 2002. The MRS sought to enhance quality and productivity in the public service through improved service conditions, pay structures, and career prospects. However, it elicited widespread denunciations especially against its written examination component. Despite several revisions, the government was forced to abandon its 2012 pay plan amid public-sector union pressures.

Service delivery reforms have performed better. Reforms like process-reengineering and one-stop centers, client's charters, and quality improvement initiatives are generally viewed positively, although it is hard to pinpoint exactly how much each has contributed. Much of the public services are now available online that people and businesses can access them at their own convenience. Additionally, urban transformation centers have brought service-delivery agencies in

one location throughout the nation, thereby making public services conveniently accessible to the public. The GTP, the reform currently underway, has had an impressive start; it has demonstrated evidence of concrete improvements in service delivery in various areas.

Besides our positive interview findings, validation from independent audits also attests to improved public perception on the impacts of the GTP. Table 1 summarizes the GTP achievements over the past 6 years. As shown, the GTP has performed commendably, having exceeded targets in most NKRAs. Although the overall achievement rate is quite high, it also shows a declining trend since 2013 and ongoing challenges in areas of corruption, education, and cost of living. The apparent downtrend in composite scores perhaps reflects diminishing returns as the GTP enters the more challenging phase that involves tougher fixes after strong performance in delivering "low hanging fruits" in its early phases. Some observers see the GTP success as "pockets of excellence" which caused balkanization of public service with different parts operating at different speeds (Xavier 2013).

## Discussion: Learning from Malaysia's Experience

Best practices have shaped much of Malaysia's reform programs. The Thatcherite and Reaganite ethos of reforming the public service through private-sector practices inspired Malaysia's privatization reforms. Similarly, international practices of performance budgeting, TQM and ISO certification as proof of quality, KPIs and performance-target setting, league tables of service performance, citizen's charter, and e-government have created motivation for similar reforms in Malaysia. As these reforms addressed broad issues of service improvement, they produced limited impacts. Given their broad remit, results were long in coming and hard to discern. Malaysia's experience with performance budgeting and the performance-related pay shows a "lack of fit" to local context. After 45 years of experiment, the specifics of outcome measurement and program evaluation under the MBS have remained elusive. Likewise, despite noble intentions, pay reform proved difficult (Xavier et al. 2016).

The Malaysian experience broadly validates the limitations of the best-practice and top-down approach. The observance of other "best practices" such as the ISO, TQM, and quality control circles has been more in form than in substance, usually referred to as "isomorphic mimicry" (Levy 2015). However, reforms that are specific regarding problems to be addressed such as the GTP have had greater success. That is, targeted efforts that focus on specific aspects of public service tend to be more effective than comprehensive government-wide reforms.

Nonetheless, the Malaysian experience makes it hard for us to dismiss "best practice" reforms,

more so as the GTP itself, patterned on the UK model, constitutes a best practice. Therefore, this entry challenges the view that best practices are inappropriate for administrative problems in developing countries (Pritchett and Woolcock 2004). Notwithstanding their failure to produce visible results, the incremental and cumulative effects of best-practice reforms on public service can be significant. Despite poor records in some areas, the overall impact of Malaysia's reforms has been positive, as reflected in global assessments that compare Malaysia quite favorably. The 2015 world competitiveness report ranks Malaysia at 18th position out of 140 economies. Malaysia tops the list among 20 economies under the transition stage from an efficiency-driven to innovation-driven economy (WEF 2015). Malaysia is ranked as the 14th most competitive nation in the world. Further, Malaysia is the sixth most business-friendly and eighth most efficient government globally, according to the Global Competitiveness Report 2014–2015 (WEF, 2014–2015). Malaysia holds 60th position among 184 countries in the UN e-government development index (UN 2016).

The Malaysian experience shows that successive reforms have built on previous ones to embed a performance culture in the public service. Past failures have provided the paradoxical foundation for present success, through the momentum for change and the systems and processes that the previous reforms generated (Xavier 2013). The Malaysian case also shows that in the design and execution of a reform, central direction alone will not do. This was the *modus operandi* in the past. Recent reforms have taught the authorities that there must be consultation from ground up especially in identifying the pain-points of citizens respecting public services and how these issues can be resolved. The GTP encapsulates such a consultative approach. The areas for service improvement that citizens were most concerned about were identified from citizen feedback. Likewise, consultations with stakeholders – private and public sectors and the public – were solicited through reform labs. These consultations also offered a forum to hammer out an execution road map for the solutions suggested to overcome service improvement issues. In the process, these consultations laid a solid foundation for reform success (Iyer 2011).

A further lesson of Malaysia's experience is that substantial reforms require substantial resources. Given its political significance, the GTP was able to attract disproportionate amount of resources. It also benefitted from the patronage of the highest political office, as reflected in the active involvement of the Prime Minister and his deputy in the GTP process.

## Conclusion

The Malaysian experience shows that bulk of reforms were based on international best practices. Over the years Malaysia has come to realize that reforms would have a better impact if they were diagnostic and specific problem-focused and if stakeholders were taken in confidence. Hence, the GTP was born. The GTP experience largely vindicates the World Bank's recent approach to public management reform. It highlights that reforms that are based on thorough diagnosis of the situation have a better chance of success. This is because they resonate with the public and help attract disproportionate amount of resources. They also offer a platform to blend the top-down and bottom-up approaches where practitioners take heed of the collective wisdom of all stakeholders, including the public.

While a problem-oriented approach to reform is more impactful, the value of best practice reforms should not be underestimated. The latter may not have laser-sharp focus on the public service delivery problems like the diagnostic approach yet they do have a general sense of enhancing performance. While it is diagnostic, the GTP is not without the taint of the best-practice approach. Whatever the merits of a diagnostic model over the best-practice approach, the Malaysian experience indicates that it is the follow-through of the implementation effort together with a robust system of

accountability that ultimately determines reform success.

## Synonyms

Genocide; Indigenous People of Biafra [IPOB]; Nigeria-Biafra civil war; Secession; Western power

## Definition of Terms

| | |
|---|---|
| Secession | A political withdrawal from an independent nation to form a separate political entity – a state |
| Biafra's Secessionist Movement | This refers to a political struggle championed by late Lt. Col Odumegwu Ojukwu in 1967 to form an independent nation of Biafra. The secessionist movement led to Nigeria-Biafra civil war that lasted between 1967 and 1970. |
| IPOB | It is an ellipsis for Indigenous People of Biafra [IPOB], a new separatist movement championed by Nnamdi Kanu in the Eastern part of Nigeria. |

## Introduction

On 30 May 1967, the Federal Military Government [FMG] in the Eastern Region, headed by late Lt. Col Odumegwu Ojukwu, broadcasted the secession of Biafra from the Nigerian federation and its independence as a sovereign State. He acted so as a result of mammoth massacres of more than 30,000 Igbos in the northern Nigeria in September 1966 (Smith 2014), which led to Nigeria-Biafra civil war, characterized as a

"Holocaust dramaturgy" (Heerten and Moses 2014), shrewdly to eliminate the Igbos from the surface of Nigeria's vista, considered as one of the most deadly conflict before the episodic tumult of Rwanda genocide. The phenomenological reminiscence of devastation and self-acclaimed genocide of Igbo nation triggered by expulsion synchronized in the northern region and relinquish proclamation from Nigerian federation which ultimately convoyed through 1967 civil war to the current secessionist uprising led by Nnamdi Kanu, the leader of Indigenous People of Biafra [IPOB], becomes a substantial concern for global political debate.

While the origin of the crisis is traced to leadership struggle among Nigerian political elites, as put by Kirk-Greene (1975), the genesis of this political upheaval had its roots in general disillusionment within the then Nigerian ruling political class. Although, countless reservations have been made on this issue by participants and observers as well as post-hoc public affair analysts. The central theme of this war appeared not only to be indigenous, as accounts could be referenced on the significant role played by both western and eastern powers. The former, namely Soviet Union and Britain, as documented by Ogunbadejo (1980), wanted to establish its foothold and further extend their influences, while the eastern powers, China and France, embraced the biafran cause.

The Nigerian security challenges, although, had before the civil uproar, thus serving as a major setback in driving the course of a neo-colonialist state. This was evident in 1962 crisis on political census among other civic anomalies. The Nigerian sovereignty became scattered at the eve of this civil unrest in 1967. This position seems susceptible because the challenges posed by this civil explosion between 1967 and 1970 still linger in the security tensions of the Nigerian nation-state. From this subjective position, it may therefore be possible to understand the fundamental and formative set of coinciding forces and circumstances whose applicability, as argued by Kirk-Greene (1975), have a more general validity for wider issues on continental security in the new states of independent Africa.

The Northerners and Easterners took the confrontational stage during the civil war, as the latter assumed the position of minorities, encapsulated with the motive of seceeding from the geographical area known as Nigeria – which still constitutes, among others, the bane of Nigerian democracy. Secessionist movements present themselves to the global public as analogues of colonial liberation movements: long-established identities are denied rights of self-determination by quasi-imperial authorities (Federal Military Government). Secession is, by definition, spatial. That is, the exiting group must inhabit contiguous territories that can form a unity distinct from the existing political entity. In the normal case in which the richer part of the national population is geographically dispersed – for example, living in the better suburbs of each city.

The Northerners seemed to take a posture of dominant ruling group, as most of the ethnic men were at the corridor of power. Often, elements of ethnic affinity and prebendalism is, at glaring level, observed in actions and activities of the military junta. Intertwining issues therefore emanates from the different ethno-political positions of the military leaders. In this regard, the inter-ethnic conflicts pose to be inimical to the democratic sustenance in the polity. For instance, whenever a Northerner emerges as the leader of the country, governance impeding crises, most times, upsurge in the eastern part of the country, vice versa. This milieu, which has its roots in the Nigeria-biafra war, provides a flashlight to most crises, which although takes different dimensions, specifically on religion as well as regional disadvantages, but mostly hinges on personal disillusionments of the ruling class.

Fifty years (50 years) of Nigeria-Biafra civil war – 1967–2017, the Eastern Nigeria could not move away from the deplorable memories the war entrenched in the psychological, sociological, economical, and political landscape of the region. The resurgence of Biafra agitation for statehood under the civilian regime of President Muhammadu Buhari raises a fundamental

question in Nigerian political discourse, with reference to the emergence of Nnamdi Kanu, a leader of IPOB, and the political and security implication that surrounds the agitation. In this entry, an attempt is made to investigate the posthumous waves of Biafra's secessionist movement that metamorphosed into Nigeria-Biafra civil war in 1967 and political impasse that circumvents its resurgence in 2017. The memories of the war have recently gained momentum in the Easter region, as underscored by the formation of the Indigenous People of Biafra [IPOB]. This entry provides alternative political solution, channeling through regional autonomy in the country. It further argues that existing 36 states should be jettisoned by conceding autonomy to allow each province valve from their natural resources and reimburse the necessary approved revenue formulae to the national government. The subterfuge behind this proposition is to make the center unappealing to ethnic cronies, political elites, and Biafra secessionists.

## The New Waves of Biafra Secessionist Movement

In the post-civil war regime, the ever-increasing cadence for statehood has been threatening the political consolidation of Nigerian ethnicized matrimony, marked as second wave of Biafra secessionist movement, muscled by Indigenous People of Biafra [IPOB], concocted by Nnamdi Kanu [IPOB], validates the chronological pursuit toward independence of Biafra nation. The former Biafra's leader Lt. Col Odumegwu Ojukwu was defeated by Nigerian state in his expedition to declare a sovereign State of Biafra in 1967; however, the resurgence of a new movement – [IPOB] – in 2015 triggers the second waves of secessionist impasse that raises a contemporary political discourse in Nigeria.

Nnamdi Kanu formed Indigenous People of Biafra [IPOB] while studying at the London Metropolitan University; he pioneered Radio Biafra in London in 2009. The radio station was instrumentalized as a mouthpiece for Biafra secessionist agitation. After his study in the UK, Nnamdi Kanu was arrested in Nigeria and charged with treasonable felony. He was granted bail by the court on certain condition in 2017. The conditions include provision of three sureties with N100 million each, "he must not be seen in a crowd exceeding 10 people; and that the defendant should not grant any interviews, hold or attend any rallies, respectively" (The Punch Newspaper 22 July 2017).

The pro-Biafra nationalist accused Nigerian government of political marginalization and underdevelopment in the Eastern Nigeria. The leader of IPOB emphasized the necessity to pull out of Nigerian state; he noted that "nothing seems to be working in Nigeria. There is pain and hardship everywhere. What we're fighting [for] is not self-determination for the sake of it. It's because Nigeria is not functioning and can never function" (Aljazeera 30 May 2017). The form of marginalization of Igbo by Nigerian state includes exclusion from holding prominent political appointment in Nigeria such as Inspector-General of Nigerian Police Force, Chief of Army Staff, and other important positions. It was argued that "more than a dozen officers have held the post of inspector general police. Two of them have been Igbo. In a lineup of almost two-dozen chiefs of army staff, the highest-ranking military officer in the Nigerian army, two have come from southeastern Nigeria. There has only been one Igbo president and one Igbo vice president since Nigerian independence in 1960". "The southeast feels it has been politically marginalized. There is a point to that. It has been shrunken from being one of the three major regions of the country to now being virtually a minority with the smallest number of states of the six zones in the federation" (Aljazeera 2017).

## Biafra Claimed Territory

See Fig. 1.

## Nigeria's Federal Political Structure

See Table 1.

## Political Restructuring as an Antidote for Secession

The cacophony for political restructuring has circumscribed Nigerian polity since the resurgence of Biafra separatist movement in Nigeria. The divergence ethnic groups have pushed for devolution of power to the constituent authorities as against the current political arrangement. The

**Biafra's Secessionist Movement, Fig. 1** Ipob claims these existing states would make up an independent Biafra. Source: BBC News (5 May 2017)

existing lopsided political amalgam, which foster imbalance in political appointment and resource allocation, has been reprimanded by the Nigerian populace. According to Nwabueze "the country should be restructured into six more or less self-governing zones or regions, with the powers of the central government drastically reduced, so as to minimize the fierce contest for its control" (quoted in Vanguard Newspaper 7 June 2017).

Regionalism has played a prominent role in resolving conflict in multi-ethnic political community all over the world (Spolaore 2008). Ability to self-determination encourages optimal performance of federating units in a federal political structure; as Diamond (2004) bolsters this argument that if different ethnic and regional minorities have some autonomy, some ability to determine their own local affairs with respect to education, culture, and economic development, they will feel more secure and be more willing to accept the authority and legitimacy of the larger national state. Federalism presupposes that the national and states/or regional governments should stand to each other in a relation of meaningful autonomy resting upon a balanced division of powers and resources. Each regional government is obliged to have political capacity and resources adequate to sustain the structure of a functioning government, competent to compete on its own. In today's Nigeria, inter-ethnic intolerance has reached its pinnacle and become prevalent. Consequently, the nationalities within the Nigerian state are mutually distrustful of each other, and there are many evidences from such festering issues as the violence in the Niger Delta areas, the ethnic clashes in many of the northern and Middle-Belt states, and insecurity allover the country, the unresolved debate over the Sharia question, and the call for resources control by the southern states. In light of all these crises and mutual distrust among Nigerians, there is a definitely a need for the Nigerian nationalities to enjoy relative regional autonomy which is the basic pillar of true federalism (Abegunrin Undated). Therefore, true federalism implies a compromise between the extreme concentration of power (the current case in Nigeria) and a loose confederation of independent states, for governing people usually in a large expanse of territory. Under this form of government, local pride, traditions, and power are retained by the constituent units, while the central government is given the task of handling common problems like currency, international relations, among others.

The current campaigns for regional autonomy in Nigeria intends to augment regional development as well as providing opportunity for each region to valve from the existing endowed natural resources within its jurisdiction. Nigeria has practiced regionalism in colonial and postcolonial regimes. The each region was able to develop their agricultural produce such as cocoa in south west, groundnut pyramid in the North, as well as palm oil in the Eastern Nigeria. During this political epoch, oil has not been discovered in the southern Nigeria; therefore, this generates regional competition in developmental processes which has been a major benefit of true federal system.

Source: Authors Compilation

Adopting regionalism will quench the current glow of ethno-religion politics that lengthening insecurity in Nigerian political environment. The regions should be self-reliant in sustaining their economy and also providing opportunity for other regional entity to benefit from its economic surplus

through the exchange of goods and services in differing ethno-religious climates. The logic of regional autonomy is to make the center unappetizing to the political elites while strengthening regional political structure as well as plummeting ethnic tension that marinated Nigerian political system. Therefore, the current six geo-political zones should be retained to form regional governments; these include South-South, South-East, South-West, North-East, North-Central, and North-West, while scrapping all the 36 state in the country. Hence, each regional government should be allowed to control its resources at the same time allocating an agreed revenue formula to the central government in order to perform its statutory functions. The diagram below illustrates a proposed facade of regional government for the country:

## A Designed Model for Regionalism

Figure 2 illustration explicates structural framework for true federalism in Nigeria. The proposed political framework called for abolition of 36 states with its replacement with existing six geo-political zones which shall form regional governments. Therefore, the regional government shall be allowed to control its resource; each region is expected to allocate agreed formula from revenue generated to the central government. Assuming one quarter of the Internally Generated Revenue (IGR) of each regional government is proposed to be remitted to the central government, where N is the IGR, and AF represents the Allocated Fund. The below statistical illustration follows using this sharing formula:

**Biafra's Secessionist Movement, Fig. 2** A proposed structure for true federalism

$$¼(N) = AF$$

$$R^i : \text{North} - \text{Eastern}$$
$$= \frac{\text{InternallyGeneratedRevenue} \times 100}{4}$$
$$= ¼(N) = AF$$

$$R^2 : \text{North} - \text{Central Region}$$
$$= \frac{\text{InternallyGeneratedRevenue} \times 100}{4}$$
$$= ¼(N) = AF$$

$$R^3 : \text{North} - \text{Western Region}$$
$$= \frac{\text{InternallyGeneratedRevenue} \times 100}{4}$$
$$= ¼(N) = AF$$

$$R^4 : \text{South} - \text{Eastern Region}$$
$$= \frac{\text{InternallyGeneratedRevenue} \times 100}{4}$$
$$= ¼(N) = AF$$

$$R^5 : \text{South} - \text{Southern Region}$$
$$= \frac{\text{InternallyGeneratedRevenue} \times 100}{4}$$
$$= ¼(N) = AF$$

$$R^6 : \text{South} - \text{Western Region}$$
$$= \frac{\text{InternallyGeneratedRevenue} \times 100}{4}$$
$$= ¼(N) = AF$$

At the end, the summation of the Allocated Funds (i.e., $\sum AF$) becomes the remittance to the central government so as to carry out the national assignments as specified by the governing rules and regulations. However, the "truthfulness" of this type of federalism relies on the regional government, by ensuring immediate and accurate disbursement of the agreed sharing formula without recourse to the inequality of revenue generated by various regions.

## Conclusion

It is important to note that ethnicity, identity politics, and the problem of marginalization are the major issues that circumvent Biafra secessionist movement in Nigeria. The absence of mutual trust in the political settings of the country has necessitated the incessant agitation of the Pro-Biafra nationalists. To ease ethnic edginess and lengthening political turmoil, this entry advocates for regional autonomy as a panacea for Nigerian lopsided federal political structure; regionalizing the political composition is tantamount to efficient allocation of resources to provide infrastructural facilities which will allow regional competition for development in Nigeria. Under the new arrangement, each regional government or geopolitical zone should be allowed to manage its resources to foster development for the benefit of the people. In order to achieve sustainable regional political edifice, a new peoples' oriented constitution needs to be enacted by the existing regions which shall provide prospect for ethnic dialogue and mutual cohabitation for the sustenance and demonstration of true federal political assemblage in Nigeria.

# Bias in the US Criminal Justice System

Tia Sherèe Gaynor
University of Cincinnati, Cincinnati, OH, USA

## Synonyms

Bias against the poor; Criminal legal system; Discrimination; Gender bias; Implicit bias; Inequality; Racial bias; Racial disparity; Sentencing bias

## Definition

Bias in the criminal justice system refers to the systematic ways in which undesirable social groups are disproportionately impacted and targeted by agencies and actors working within law enforcement, corrections, and the courts.

## Introduction

The criminal justice system in the United States is primarily comprised of agencies and actors working within law enforcement, corrections, and the courts. Bias in the criminal justice system refers to the systematic ways in which certain social groups – those considered undesirable in society – are disproportionately impacted and targeted by these agencies and actors. Targeted groups tend to be associated with crime and criminality and experience profiling throughout all facets of the criminal justice system. Overwhelmingly, bias in the criminal justice system is experienced by people who are not affluent, White, cisgender, and heterosexual.

Structurally, each component of the criminal justice system works in conjunction with the other to generate social group disparities, revealing how public agencies and policy – at all levels – contribute to the disparity that exists and persists in the impacted communities.

Consequently, bias is engrained in the culture and practice of criminal justice public administration. Conscious and unconscious biases play out in the use of discretion, decision-making processes, and implementation of policy.

## Law Enforcement

Modern-day policing in the United States can be traced to the mid-seventeenth century. As larger numbers of immigrants began to settle in northern areas, mostly New York City and Boston, changes in culture, crime, and other social disturbances increased. In response, settlers began to organize watch systems and volunteer groups in efforts to maintain order. In the mid-1600s, a system of volunteer night watchmen was created to provide warnings of imminent danger. Watchmen were ineffective at crime management, largely because many of the volunteers were attempting to elude military service, were participating as punishment, or were drunk while working. The constable system was later created as a form of oversight, although these positions had no law enforcement responsibilities and were mostly used to survey land and, in some locales, oversee watchmen.

By the mid to late-1800s, informal mechanisms of law enforcement began to evolve into the creation of formalized police organizations designed to restore order and social control in local communities. The first police departments in the United States were Boston, MA (1838); New York City, NY (1845); Albany, NY and Chicago, IL (1851); New Orleans, LA and Cincinnati, OH (1853); Philadelphia, PA

and Milwaukee, WI (1855); and Baltimore, MD and Newark, NJ (1857). These quasi-military police forces professionalized the practice of law enforcement in northern United States and, for the first time, offered officers full-time salaries as employees of a government agency.

In the southern states, White society's fear of slave rebellions led to a perceived need to supervise Blacks by local enforcers (Spruill 2016). By the mid-1700s, slave patrols existed in every antebellum southern colony to enforce slave codes – laws that attempted to control the activities of enslaved Africans. These patrols served as the first distinctive police system in the southern United States. While slightly varied across colonies, slave patrols had three main overarching responsibilities. First, to patrol and disrupt the socializing and gatherings of enslaved and free Africans, both on and off plantations; second, to oversee discipline and apprehend enslaved Africans who attempted to run away; and, third, to protect White communities, people, and their "property."

Following the Civil War and the emancipation of enslaved Africans, the slave patrols grew into, what are now, modern police forces. At this time, the role of such police forces was largely for the social control of free Blacks and to enforce Jim Crow laws. The evolution of policing in the United States has, historically, had no direct correlation with peaks of or a reduction in crime but rather to maintain order and enforce social control (Potter 2014).

Across time, practices of social control have been disproportionately associated with groups deemed less desirable, i.e., people of color, those who experience poverty, and those who identify as LGBTQ+. As social control was positioned as law enforcement the regulation of undesirables was not seen as an association between identity and economic conditions but as a means to address the "ills" of society, legitimizing policing those considered to be more prone to criminal activity (Muhamnad 2010). The associations connecting identity and crime have persisted overtime and have resulted in biased policing across the United States.

The US Department of Justice (DOJ) states that biased practices are unfair, maintain negative and harmful stereotypes, and promote mistrust of law enforcement officials and agencies. In the 2014 report, *Guidance for Federal Law Enforcement Agencies Regarding the Use of Race, Ethnicity, Gender, National Origin, Religion, Sexual Orientation, or Gender Identity*, the DOJ prohibited officers and agencies from the use of biased, inappropriate considerations. However, in its investigations, the DOJ has also found that law enforcement agencies across the country routinely engaged in biased policing practices against people of color, the LGBTQ community, Spanish-speaking individuals, and those of lower socioeconomic status.

Bias in US law enforcement agencies has persisted throughout time. Its foundation as watchmen, slave patrols, and enforcers of social control has fostered a legacy that has produced injustice for targeted communities since its inception.

## Corrections

As a network of government and private agencies, the US correctional system is tasked with the supervision of incarcerated people, those on parole or probation, or those with other penalties that require supervision but not incarceration. While corrections are considered the "back end" of the criminal justice system, it is important to understand that it is not synonymous with incarceration. Incarceration is one component of the larger system. Most people under correctional supervision are not incarcerated but remain restricted and under governmental control.

The first prison in the United States was established in 1773 in Philadelphia. The Walnut Street Jail was meant to ease overcrowding in the existing city jail. The prison system, at that time, did not consider rehabilitation but was solely a place to house criminals. However, in 1790, through the influence of Quakers in Philadelphia, Walnut Street Jail became the first state penitentiary in the United States. By designing the facility with windows located high on the walls and

building individual cells that are isolating, the Walnut Street Penitentiary House offered incarcerated people time and space for reflection and rehabilitation. According to the Quaker belief system, this solitary confinement was not punishment but an opportunity for those who were incarcerated to be remorseful.

With an increase in crime in Philadelphia, came the need for additional facilities leading to the establishment of the Western and Eastern State Penitentiaries in 1826 and 1829, respectively. As part of a movement meant to change the behavior of incarcerated people through "confinement in solitude with labor," Eastern State Penitentiary became one of the most expensive and emulated prisons in the country. The first prisoner at Eastern Penitentiary was Charles Williams, an 18-year-old African American man convicted of larceny. Other states quickly followed the lead of Pennsylvania, building more prisons and incarcerating more individuals and increasingly incarcerating people of color at disproportionate rates.

Prior to the Emancipation Proclamation in 1865, the labor force and the US economy were tied to the enslavement of Africans. After the Civil War and the ratification of the 13th Amendment, business owners found themselves in need of labor to perform the duties that had been previously completed by Blacks. While the 13th Amendment to the US Constitution abolished slavery, it also explicitly exempted slavery and involuntary servitude as punishment for a crime. Accordingly, Black codes – laws that exclusively applied to subjecting Black people to criminal prosecution for quality of life offenses – were passed. These laws were effective in using vagrancy, loitering, and other minor offenses to incarcerate Blacks and poor Whites. With increasingly more people incarcerated through convictions under Black codes, the system of convict leasing became commonplace and useful in reviving the labor force that was vacated by emancipation.

Convict leasing was a highly profitable system where the labor of incarcerated individuals was controlled and distributed to private industrialists. These private interests were responsible for housing, clothing, and feeding prisoners while using their labor to fill the labor gaps left from the abolishment of slavery. Through the exploited labor of primarily Black men, many who were incarcerated through Black codes, private industry and governments made substantial financial profits.

The United States has less than 5% of the world's population but almost 25% of the world's incarcerated population. As of 2016, there were more than six million people under the supervision of US adult correctional systems. The US corrections system has and continues to be biased against targeted individuals including people of color, those of lower economic status, and individuals who identify as LGBTQ. Largely because of former President Nixon's War on Drugs, the United States targeted Black communities and now jails more people than any other nation in the world. These practices disproportionately impacted communities of color, despite parity in drug use and sales rates. People of color, in the United States, are more likely to be arrested and incarcerated than Whites for drug offenses and are therefore, overrepresented in the corrections system.

Targeted communities disproportionately experience the collateral effects of bias in the US corrections system. Laws associated with convictions impact formerly incarcerated individuals' voting rights, employment opportunities, and access to public housing and student aid, resulting in a de facto second-class citizenship status. As the effects of mass incarceration are concentrated in the same communities, its impact is much broader than just the incarcerated individual. The larger communities and the neighborhoods themselves are also affected. These include stress and dissolution experienced by family members, high mobility of community residents moving in and out of prison, and an increase in community residents with scarce employment opportunities, impacting the economic stability of targeted communities.

The biases that exist within each facet of the system have created a complex web of practices, policies, and organizations that concentrate on and negatively impact targeted communities.

## Courts

Bias within the US legal system occurs in several forms and crosses varying components. These biases impact bail decisions, sentencing, and convictions, among other areas.

Judges hold a tremendous amount of discretion when determining who will be held or released before trial. Bail judges have the option to release defendants without a monetary condition, with a monetary condition, or not at all. If the judge deems a defendant a flight risk or a danger to the community, they can be held in jail without bail. While bail is not guaranteed by the Constitution, the Eighth Amendment states that when given, it should not be excessive. When bail is set, however, disparities exist. Black defendants are more likely to be assigned monetary bail and at larger amounts than their White counterparts. Defendants who are unable to pay bail or bond are detained in jail prior to their trail. Individuals, in these cases, are more likely to be convicted and to receive lengthier prison sentences than defendants who are released before trial.

Race also plays a key role in sentencing decisions. Harsher sentences are more likely to affect communities of color and at higher rates than White communities. Offenders whose victims are White are more likely to receive longer sentences than those who commit crimes against victims of color. Prosecutors are also more likely to pursue mandatory minimum sentences for defendants of color than for White defendants for the same offenses.

Race neutral policies are responsible for some of the racial disparities in sentencing that has inadvertently resulted in disproportionate impacts for people of color. Race neutral policies refer to laws that do not explicitly target people based on race or ethnicity but result in overwhelming racial and ethnic disparities. For instance, mandatory minimum sentencing, school zone drug laws, and crack cocaine sentencing laws while seemingly race neutral have played a major role in the disparities that exist in incarceration rates.

Bias is a part of each stage of the legal process. Targeted groups are more prone to experience bias and, consequently, more likely to have a negative and disparate outcome when interacting with defense attorneys, judges, probation officers, and even juries.

## Conclusion

The historically embedded associations between identity and crime are fundamentally responsible for the establishment and continuation of disparate outcomes in the criminal justice system. Bias against targeted populations has been and continues to be allowed in the various criminal justice sectors, making it a key defining aspect of the system. The disproportionate and biased processes that occur in policing contribute to disparities in the courts and ultimately shape outcomes in corrections. Further, the long-term culmination of biased policies, practices, attitudes, and decisions has produced an administrative structure characterized by the highest rates of incarceration in the world and a prison population that is overrepresented by people of color. These decisions and practices have created an imbalance both within and outside the criminal justice system, impacting the structures, economic vitality, and long-term sustainability of communities.

# Bibliometrics in Public Administration

Tânia M. G. Marques[1], Nuno Rosa Reis[1] and Fernando A. R. Serra[2]
[1]CARME – Centre of Applied Research in Management and Economics, School of Technology and Management Polytechnic of Leiria, Leiria, Portugal
[2]Graduate Program of Business Administration, Universidade Nove de Julho, São Paulo, Brazil

## Synonyms

Altmetrics; Scientometrics; Quantitative measures of research outputs

## Definition

Bibliometry is the application of quantitative methods, namely, mathematical and statistical methods, to research outputs, such as articles, books, or others, to gain an overview of an existing research field.

## Introduction

Bibliometrics refers to the studies which seek to compute the processes of written communication, including several methods for tracking the scientific information on a discipline, a field, or a topic. Thus, bibliometrics make available a complementary perspective of the history, path, and evolution of a discipline through the quantitative analysis of its existent literature. In Public Administration, there is arguably a scarcity of bibliometric studies. The relevance and usefulness of the bibliometric approach have not been yet fully grasped by the Public Administration scholars. Thus, an advancement on this comprehension and a widespread use of bibliometric techniques may contribute to advance the research in the Public Administration discipline.

## Relevance

Bibliometric studies are considered a useful tool to analyze a research field or a given research issue. They are widely used in several disciplines, ranging from Physics to Economics, from Medicine to Computer Science. They are especially useful to complement traditional literature reviews. The abundant bibliometric studies that have been published recently particularly in social sciences – international business (e.g., López-Duarte et al. 2016), public administration (e.g., Marques 2020; Ni et al. 2017), and performance management separating the business domain from public sector (e.g., Cuccurullo et al. 2016) – also denote bibliometrics' importance and usefulness.

Bibliometric studies have a number of merits that are worth pointing out. First, they allow dealing with a large volume of works and analyze them to detect patterns and trends. Reviewing hundreds or thousands of papers using the traditional approach would not be feasible. Second, they allow performing quantitative analyses of the extant literature which help gain a broad understanding of the field. They are especially useful for newcomers to quickly grasp the existing literature on a given discipline, field, or topic. Third, the quantitative and graphical tools available allow researchers to understand the intellectual structure of a given field. This mapping of the literature allows to better understand the structure of the existing literature and to detect emerging themes and research gaps.

In general, bibliometrics have advantages over traditional literature review approaches. Bibliometrics facilitate systematic quantitative analysis of the existing literature on a specific (or a combination of) topic. Moreover, bibliometrics allow scholars to reveal unseen ties

among large volumes of bibliometric materials, bringing explicit connections to light and creating visual images of those ties. By allowing subsequent use of the same method (namely, concerning procedures and databases), bibliometrics allow replication thus enhancing generalization. Notwithstanding the relative merits of bibliometrics, it is worth mentioning that it is useful to complement bibliometric studies with qualitative analyses. However, qualitative analyses may focus specifically on the most relevant works identified through the bibliometric studies.

## Data Sources and Types of Bibliometric Analyses

Bibliometrics require the analysis of research outputs. These research outputs may be books, dissertations, proceedings papers, or, more commonly, peer-reviewed published papers. Usually bibliometric studies rely on papers published in leading journals for two main reasons. (1) The research fields are usually led by high-impact papers published in leading journals. Thus, getting a clear picture of a field and grasping the relevance, the theoretical foundations, and the historical evolution require analyzing the papers published in leading journals. (2) The leading journals are usually included in indexes and databases that collect and offer easy access to the meta-data needed for the bibliometric analyses. Therefore, for practical reasons, the bibliometric studies usually retrieve the information from Web of Science, Scopus, Journal Citation Reports, SciVal, Google Scholar, and others.

The bibliometric studies may offer a wide range of information, using several types of analyses. On one hand, the outlets of the research may be analyzed to assess the journal (or conference) that leads the publishing efforts in the field. On the other hand, authorship analyses (along with the affiliation analyses) allow identifying the most prolific authors and the universities/research centers that drive the field. Furthermore, it is also possible, using co-authorship analyses, to identify networks of collaborating authors, thus mapping eventual clusters and their interconnections. Finally, it is also possible to analyze the keywords and the abstracts to depict the most relevant (i.e., the most common) words and their connections (i.e., which words are often used together), thus constructing a networking and observing the centrality of the most relevant concepts.

Nevertheless, despite the existence of several bibliometric procedures, citation analysis is one of the most commonly adopted. Bibliometrically analyzing the knowledge base of the works (the analysis of the bibliographic references included in the sample of the literature reviewed) provides a measure of scholarly influence and assesses the development of a discipline. The most often cited works (or authors) are deemed the more influential in the field and arguably the most relevant. Also, bibliometrically analyzing co-citations (examining the joint use of references in each article) of prior research among scholars allows the scientific community to draw the knowledge base of the research field, inferring the most relevant works and the relation among them, i.e., the intellectual structure of the field. This thus allows to create a graphic representation of the intellectual structure that makes visible the interconnectedness of the studies which form the knowledge base of the field.

## Bibliometric Studies in the Field of Public Administration

Bibliometric studies are not widespread in the Public Administration discipline. Despite the merits and usefulness, Public Administrations scholars have seldom used these techniques to organize the existing knowledge of the field. Public Administration scholars have implemented forms of discourse analysis on, for instance, New Public Management (NPM) studies, where they have identified major trends, offered definitional clarity, and examined its influence, diffusion, and change over time. Nevertheless, there are some noteworthy examples of bibliometric studies in Public Administration (e.g., Chandra and Walker 2019; Homberg and Vogel 2016; Marques 2020; Vogel and Masal 2015).

Based on the bibliometric analyses of the mentioned studies, some important conclusions may be pointed out. Chandra and Walker (2019) conducted several bibliometric analyses of Hood's 1991 article "A Public Management for All Seasons?" (Hood 1991) and its impact on Public Administration field. They concluded, from the citation analysis of the 949 Hood-citing articles in the Web of Science, that Hood is typically studied within Public Administration, but it also shows that Hood (1991) is an ongoing topic of interest beyond the Public Administration field. Citation progressively increases over time and includes several citation peaks in 1998, 2008, 2011, and 2015. In the analysis of the top 40 journal sources where Hood is cited, 12 Public Administration journals contained at least 10 articles that cited Hood (1991), and *Public Administration* is the journal leading this analysis. Thus, Hood (1991) has been widely cited in many journals. The main findings from the co-citation analysis showed that the field has been led by a close association between the writings of Hood and other leading authors on NPM (e.g., Aucoin, Barzelay, Ferlie, Osborne), including Hood's coauthors (Dunleavy and Peters).

Homberg and Vogel (2016) combined a bibliometric analysis and a meta-analysis using data from the Social Sciences Citation Index. The study reviewed how the extant literature on public service motivation (PSM) and human resource management (HRM) are interconnected. Several results emerged, namely, that HRM is among the core subject categories to which the literature on PSM refers. The study shows the interdisciplinary structure of the field and public sector is by far the largest and most central cluster among the core subject areas. This was especially useful to put this research area into context, since Homberg and Vogel's study (2016) was an introduction to a special issue on HRM and PSM.

Marques (2020) also analyzes the interconnection between public service motivation and leadership, within the Public Administration discipline. The study employs bibliometric techniques on a sample of articles published until 2018 and indexed in Web of Knowledge (formerly Web of Science). Results show that, recently, a continuous increase of this line of research has occurred, the USA is the country driving the research, and Bradley E. Wright emerges as the most productive author. Moreover, the transformational leadership approach emerges as a key feature of the research on PSM and leadership. Based on the citation analysis, the seminal work "The motivational bases of public service" by Perry and Wise (1990) is found to be the most influential in this line of research. Additionally, results of the co-citation analysis recognize the strong interconnection between the works by Perry and Wise (1990) and by Perry (1996) as being the drivers of the field.

Finally, the study by Vogel and Masal (2015) analyzed and reviewed the literature on public leadership with a novel combination of bibliometric methods. The findings allow to identify some trends in the extant literature, namely, four generic approaches to public leadership. According to the literature analyzed, the public leadership may have one of the four traits, a functionalist, a behavioral, a biographical, and a reformist approach, which differ with regard to their philosophy of science in terms of objective vs subjective and level of analysis in terms of micro-level vs multi-level.

A detailed reading of the briefly presented works is recommended as several other results and details are identified in the works. Nevertheless, it is possible to identify some common findings in the bibliometrics in Public Administration. On one hand, it is possible to identify the works (and therefore the theories) that are more often used and therefore the theories that drive the Public Administration discipline. On the other hand, identifying and depicting the interconnection between works of the knowledge base may help understand the commonalities of different theories, their evolution throughout time, and the overall intellectual structure of the field. All in all, the rearview mirror perspective that bibliometrics offer allow readers to get an overall perspective of the discipline as a whole or of specific fields within Public Administration.

## Conclusion

Bibliometric studies are very common in several disciplines as they offer a means to deal with large volumes of research. They are especially useful to identify the intellectual structure of a field, to map the evolution, and to discern emerging themes and existing research gaps. As Ni and colleagues put it, "[a]cting as meta-analysts, bibliometricians whose role is to present results and not to speculate on their meaning, we, instead, turn to you reader, the experts in the field, to interpret or evaluate these results" (Ni et al. 2017, p. 505). Therefore, bibliometric studies would be beneficial for further developing the research in Public Administration, allowing the readers (and researchers) to identify novel issues and existing gaps and thus advancing the research. The lack of the use of advanced bibliometric analysis in Public Administration may be one reason for the rare studies on the evolution of a concept, theory, or seminal article in Public Administration (Chandra and Walker 2019). Thus, we call for additional bibliometric studies in all the fields of the Public Administration discipline.

## Synonyms

Administrative review; Bid challenge

## Definition

Bid protest is a formal, written objection to agency's solicitation for bids or offers, award, or

proposed contract award. Bid protest is a challenge to the terms and conditions of a solicitation, an award decision, or a decision to cancel a solicitation or award.

## Introduction

This article examines bid protests in public procurement. The article defines bid protest, describes bid protest behaviors, and provides potential theoretical explanations of bid protests behaviors in procuring and disposing entities. The paper is anchored on the justice perception and complexity models to demonstrate that bid protest behaviors are a result of injustice- and complexity-related constructs of interactions, networking, and coordination.

### Protest

Protest is a product of frustration, anger, and alienation. Klandermans (2004) posits that protest is undertaken to enforce change and gain dignity through struggle and moral expression. Contempt, anger, and fear influence protest participation (2004). Fear of a protest may motivate procurement agency officials to conduct more rigorous market research, hold a competition instead of sole-source awards, or conduct a more thorough and fair competition (Schwartz et al. 2013). Fear of a protest could also prompt officials to try to structure a contract in a manner deemed less likely to be protested (Schwartz et al. 2013). Bid protest leads to effective competition, investments and innovations, cost-efficiency, promotion of ethics, and transparency (Parry 2011).

### Bid Protest

Bid protests play a central essential role in protecting the integrity of the procurement system (Gordon 2006). Rankin and O'Hara (2016) observe that bid protest which is also referred to as "bid challenge," presents opportunity to the suppliers to scrutinize government procurement practices. A bid protest is a written objection to the conduct of a government agency in acquiring supplies and services for its direct use or benefit. Among other things, the challenged conduct can include violations of law or regulation in the way in which an agency solicits offers for a contract, cancels such a solicitation, awards a contract, or cancels a contrac. Bid protest is a formal, written objection to agency's solicitation for bids or offers, award, or proposed contract award. Bid protests are challenges to the terms and conditions of a solicitation, an award decision, or a decision to cancel a solicitation or award. Arena et al. (2018) note that bid protest are challenges to the terms and conditions of a solicitation, an award decision, or a decision to cancel a solicitation or award. A bid protest is classified into pre-award and post-award protests. Pre-award protests generally raise issues about the terms and conditions of the solicitation. They may challenge an interpretation of specific language in the solicitation document or decisions to restrict competition. Post-award protests typically challenge the evaluation process by arguing that the soliciting agency failed to follow evaluation criteria; that the evaluation violated procurement laws, regulations, or policies; or that the award was arbitrary and capricious or exhibited an abuse of discretion (Arena et al. 2018).

### Bid Shopping

Bid shopping currently is not illegal, but it is certainly unethical practice. Bid shopping is defined as the unethical practice in which a contractor discloses the bid price of one contractor or sub-contractor to another, in order to obtain a lower bid price (Degn and Miller 2003). According to Angelo (2002), bid shopping exists in three forms: pre-award shopping, post-award shopping, and electronic reverse auction bidding; all three can lead to questionable ethical practices. Travers (2015) posit that bid shopping occurs when contractors disclose the bid price of one sub-contractor or supplier to its competitor in order to obtain a lower bid. Butcher and Tayton explain that bid shopping is often facilitated when the tender impose requirements or award marks in a way which favors the incumbent supplier over other suppliers. The contracting authority might have favored one bidder over another in its scoring, by awarding more marks for a similar answer. The contracting authority might not have applied

the award criteria correctly. The contracting authority might have changed the award criteria or weightings after bids have been submitted to favor particular providers. Bid shopping occurs for several reasons. These reasons include the inability of the sub-contractor to tie the contractor to the bid. Under common law, except for on federal projects, the contractor is not obligated to contract with the sub-contractor, even though the sub-contractor's bid was used in the contractor's original bid (Degn and Miller 2003).

### Bid Peddling

Bid peddling occurs when a provider, whose bid was not selected, offers to reduce its price in order to induce the contractor to substitute it after award of the contract (Travers 2015). The sub-contractor approaches the successful prime contractor after the award and offers to perform the sub-contract work at an increasingly lower price than submitted by the sub-contractor whose bid was relied on by the successful prime contractor. It is mostly experienced in fixed-price contract type such as engineering, construction, and manufacturing. The use of low-bid selection system is steadily decreasing due to defects generated by bid peddling.

#### Bid Rotation

In a bid rigging scheme, participants often rotate bid winning by geographic areas. For instance, one road contractor may get all the works in one country, and another or others also concentrate in other countries – or by type of job or by time to give each member an opportunity to share in the spoils. Losing bidders may receive a percentage of the profits of the company or be hired as a sub-contractor to improve on their cash flows as they wait for their turn.

#### Bid Suppression

This involves members of a particular group preventing "outsider" companies from bidding. This is accomplished by rewarding an interloper or by forceful measures such as threats or violence. The procurement officials facilitate bid suppression by disqualifying legitimate bidders during the bidding process. The collusive group submits fabricated bid protest or coerces local suppliers and sub-contractors not to do business with the "outsider" in order to protect their monopoly. Sub-contractors and local providers participate in suppression of outsider firms by quoting extremely high prices to make the bid prices uncompetitive.

### Specification of Protest Participation

Schussman and Soule (2005) found presence of interpersonal network to be a good predictor of protest participation. Norris et al. (2005) noted that grievances and emotions are very important factors for motivating protest. Klandermans (2004) observes that protest participation is "wanting to express one's view and the emotions associated to it. Putnam (2000) explains that without interest, knowledge and information individuals would not engage in protest." Verhulst and Van Laer (2008) contend that organizational membership facilitates ties and organizational members are more likely to receive information about protest through channels closed to non-members. Kamhon and Yan (2001) explain that protest participation is triggered by instrumental and expressive motives. Instrumental motives relate to interests and values, whereas expressive motives are concerned with feelings and emotions (Toka 2008). Simon and Klandermans (2001) argue that apart from instrumental and expressive dimensions of protest participation, there is individual and collective motive as dimensions to protest participation. Bridge explains that collective motive focuses on group solidarities.

## Bid Protest Behaviors and Their Theoretical Explanations

Maser and Thompson (2010) argue that bid protest mechanism used by government agencies give providers the right to contest the procedure or outcomes of a procurement process. Boulding (1967) explains that protests arise when there is strongly felt dissatisfaction with existing programs, policies, and procedures. Toka (2008) explains that protest behaviors can either be instrumental or expressive. Instrumental behavior is more concerned with getting something done,

whereas expressive behavior is about sending out signals (Rugg and Coles 1995). Expressive protester more than instrumental protester offers a means by which the individual participant may stake out role. The instrumental protesters are more likely to engage in face-to-face confrontation with the target. The expressive protester elicits feelings to the target that something is not right. Instrumental protesters expect the target to respond with changes. A number of explanations based on the justice and complexity models can be used to explain bid protest behaviors.

## Justice Perceptions

Justice perception is the perception of individuals of an organization about fairness of the work environment including organizational processes followed. In organizational setting, justice perception can be of three dimensions: distributive, procedural, and interactional.

### Procedural Justice, Distributive Justice, and Interactional Justice

Procedural justice in public procurement refers to participants' perceptions about the fairness of the rules and procedures that regulate the procurement process. Procedural justice may also refer to the perceptions of justice related with the decision-making processes that result in the award of a procurement contract. Procedural justice is anchored on the principles of impartiality, voice or opportunity to be heard, and grounds for decisions. Niehoff and Moorman (1993) define the fair procedures on the basis of six rules: consistency, bias suppression, accuracy, correctability, representativeness, and ethicality. Leventhal et al. (1980) suggested that procurement procedures are fair to the degree that the decision-making process demonstrates consistency, bias suppression, accuracy, correctability, representativeness, and ethicality. If the procedures leading to the unwanted outcomes are considered unfair, individuals are more likely to respond destructively (Cropanzano and Folger 1989). Distributive justice is the perception of the bidders whether the procuring and disposing entities' savings are distributed according to the real evaluation and the performance. In this case, the perception of the bidders that the PDEs will award contracts based on fair evaluation enhances a contractor's perception about a protest. Interactional justice is the interaction between the procuring and disposing entity and the bidders who will be affected by the allocation decision.

### Interactions

Anything that enhances the interactions will result into creativity and adaptability. Complexity theory suggests that, when agents come together to share information and respond to information, novelty is gained. Onyx and Edwards (2010) posit that through interaction and action, people start to develop a collective sense of how they can cooperate but also share experiences. OGC suggest the need for buyer-supplier interaction in procurement in order to better capture innovation. Close and early engagement with suppliers can also allow access to industry knowledge not available in-house that can be used to draw better tender specifications (Uyarra 2010). Interaction between buyers and suppliers can result into obtaining procurement information related to the bidders' rights.

### Networking

The structure emerging from self-organization can often be represented as a network (Heylighen 2008). These networks take many forms in contemporary organizations, including personal contact networks, flows of information within and between groups, strategic alliances among firms, and global network organizations (Monge and Contractor 2003). Initially, agents interact with other agents, and some of these interactions are synergetic. Such interactions result into a bond, relationship, or link. Within the network, agents come together as nodes, perhaps on the basis of friendship, trust, and collaboration (Heylighen 2008). According to Yoon and Klopfer (2006), the patterns of interactions form a collective network of relationships that exhibit emergent properties that are not observable at system levels. Networking or collaborative linkages improve the potential of the organization to develop innovations (Contractor and Lorange 1988). In other words, the behavior of the system cannot be

accurately determined by simply observing the behavior of the parts. The manner in which complex systems communicate, respond to perturbations, and self-organize is understood by studying the dynamical processes through which they evolve overtime.

### Coordination

Coordination is defined as the additional information processing performed when multiple, connected actors pursue goals that a single actor pursuing the same goals would not perform (Malone 1988). According to Malone (1990), coordination means the act of working together harmoniously. Coordination specifies the nature of relationships through which coordination occurs, proposing that these relationships include shared goals that transcend participants' specific functional goals, shared knowledge that enables participants to see how their specific tasks interrelate with the whole process, and the mutual respect that enables participants to overcome the status barriers (Gitteli 2011). According to Gitteli (2011), when tasks are reciprocally interdependent, feedback loops are created among them, therefore increasing the need for coordination to enable participants to mutually adjust their actions in response to the outcomes of each other's tasks.

### Feedback Behavior

Due to instrumental value of the concept of feedback, many studies have been conducted to understand it. Feedback is essential for goal pursuit (Fishbach et al. 2010). Feedback generally refers to the process by which information from the output of a system is returned to the original source (Yoon and Klopfer 2006). According to Yoon and Klopfer (2006), feedback is an important process that both explains system functioning and also coordinates and regulates system structures and behaviors. Firms acquire information from their environment through feedback; complex systems identify regularities in that information and use this to modify behavior in the real world. In this way, they are said to be adaptive (Gell-Man 1994). Feedback may change behavior if it provides information about the nature of the project. Moreover, if feedback is public, among participants, it may influence the behavior of participants (Mas and Moretti 2009). In social group activity, the self-correcting behavior of group members is often influenced by feedback that indicates divergence from group norms (Arrow et al. 2000). Feedback is used by Ugandan firms to learn, gather, and share information by stakeholders like directors and employees to challenge the bidding and contract award processes during procurement.

### Organizational Learning

Organization learning is the process of acquiring knowledge (Gozukara and Yildirim 2016). Cyert and March (1963) describe organization learning as a process of creating, retaining, and transferring knowledge within an organization. Weerawardena (2003) defines organizational learning as the development of new knowledge or insights that have the potential to influence behavior. Learning mainly consists of two kinds of activities, that is, obtaining know-how in order to solve specific problems based upon existing premises and establishing new premises to override the existing ones (Nonaka and Takeuchi 1995). These two learning activities have also been referred to as "single-loop learning and double-loop learning" (Argyris and Schon 1978). Organization creates and organizes knowledge relating to their functions and cultures. Organizational learning happens in all of the organization's activities, and it happens in different speeds. The goal of organizational learning is to successfully adapt to changing environment, to adjust under uncertain conditions, and to increase efficiency. Organizational learning is a continuous testing of experience and its transformation into knowledge available to the whole organization and relevant to their mission (Senge 1990). According to Argyris and Schon (1996), organizational learning emerges when organizations acquire information of any kind by any means. Jones (1985) emphasizes the importance of organizational learning for organizational performance defining it as a process through which managers try to increase organizational members' capabilities in order to better understand and manage the organization and its environment to accept decisions that increase

organizational performance. An organization's adaptation is the ability to find solutions for the problems (Cyert and March 1963). Amagoh (2008) observes that an organization is able to learn from its environment and change its internal structure and its functioning overtime, thereby changing the behavior of individual elements.

### Information Acquisition

Organization learning is the process of obtaining, combining, and developing information among the members of an organization (Huber 1991). According to Dixon (1992), information acquisition refers to the organization's information processing to utilize and value different information sources in organizations. Furthermore Daft and Weick (Draft and Weick 1984) observe that information acquisition is determined by two variables, which are data sources and intrusiveness of organization. Data sources can be internal or external, and intrusiveness of organization is the extent to which organization is capable of actively penetrating its environment with browsing and searching for data information (Draft and Weick 1984). Information acquisition contains internal acquisition and external acquisition. Organizational learning processes consist of key elements supporting activities of information generation, which involve seeking, developing, comprehending, and producing novel information (Verdonschot 2005). Internally focused learning enhances the absorptive capacity of the firm to acquire new knowledge and therefore is a prerequisite for acquisition of knowledge from external sources (Jay 2003).

### Knowledge Sharing

Knowledge sharing is the activity of transferring or disseminating knowledge from one person, group, or organization to another. This definition includes both tacit and explicit knowledge (Lee 2000). According to Cummings (2004), knowledge sharing refers to the provision of task information and know-how to help others and to collaborate with others to solve problems, develop new ideas, or implement policies or procedures. Argote et al. (2000) posit that knowledge transfer in an organization is a process through which one unit is affected by the experience of another. Wang et al. (2004) describe knowledge transfer as the process of a systematically organized exchange of

**Bid Protest Behaviors in Public Procurement, Fig. 1** Antecedents of bid protest behaviors

information and skills between entities. Modi and Mabert (2007) postulated that it is the implementation of activities involving direct interaction between the procuring firms and vendors. Such activities are time- and resource-intensive for the procuring firm, and firms undertake them with the objective of increasing supplier capabilities. According to Molina et al. (2007), knowledge transfer relates to organizational learning from the experience of another. Knowledge sharing can occur via written correspondence or face-to-face communications through networking with other experts or documenting, organizing, and capturing knowledge for others (Cummings 2004). Knowledge sharing was found to be positively related to procedural justice (Schepers and Van den Berg 2007). Lin (2007) found that both distributive and procedural justice had positive indirect effect on tacit knowledge while distributive justice also influences knowledge sharing through trust.

## Conceptual Framework for Bid Protest Behaviors

Figure 1 shows the relationship between organizational learning, justice perception, and bid protest behaviors in public procurement. It attempts to provide a link between organizational learning and bid protest behaviors in public procurement mediated by justice perceptions. The model also shows the relationship between self-organization and bid protest behaviors in public procurement.

## Conclusion

It is increasingly becoming common for contractors to challenge contract award decisions or the conduct within which procurement or disposal is carried out. This paper has attempted to provide theoretical explanations for the bid protest behaviors based on the constructs of self-organization, organization learning, and justice perception in public procurement. This conceptual model which has been derived from a critical review of literature can guide scholars in undertaking empirical studies of bid protest behaviors in public procurement.

## Bioethics and Health Policy

Leandra H. Burke
Center for Clinical Research, Western Michigan University Homer Stryker MD School of Medicine, Kalamazoo, MI, USA

### Synonyms

Medical ethics; Moral philosophy; Research ethics

### Definition

Bioethics is the study of ethical issues in biological science, health care, and health policy.

### Introduction

Bioethics, as a field, has focused on a wide variety of topics, from the allocation of scarce health resources, to debates over what constitutes life, to genetic engineering. Although bioethics is primarily concerned with human well-being, it can also confront ethical dilemmas pertaining to the nonhuman biological environment. It is difficult to ascertain definite limits of the discipline of bioethics, as some bioethicists feel that the field should encompass all ethical matters pertaining to biology and medicine, while others prefer to narrow the scope. Undoubtedly, the field of bioethics continues to grow and present new challenges with emerging scientific breakthroughs, such as cloning, gene therapy, and reproductive technologies.

There is a cost to this profound advancement. While mankind has made tremendous progress in life sciences, the ethical, legal, and social ramifications of such advances must be carefully evaluated. For example, organ transplantation, a breakthrough technique responsible for saving numerous lives, is also marred in controversy over illegal organ trade. The persistent shortage of available organs to transplant has led to situations where potential organ recipients travel abroad to procure organs through monetary transactions. This has been acknowledged as a serious health policy issue in the global community. A 2004 World Health Assembly resolution (WHA57.18) reminded World Health Organization (WHO) Member States to "take measures to protect the poorest and vulnerable groups from 'transplant tourism' and the sale of tissues and organs" (WHO 2004). Moreover, geographical disparities persevere when it comes to access to this lifesaving procedure. In 2011, WHO estimated that 62% of the 112,939 solid organ transplants reported were performed in high-income Member States, while only 28% were performed in upper-middle, 9% in lower-middle, and less than 1% in low-income Member States (White et al. 2014).

The organ transplantation example illustrates the necessity for policy development to contend with serious bioethical issues. Public policies are necessary to ensure that advances in medicine and science are done in a responsible manner.

### The Four Principles

Prior to the 1960s, biomedical ethics had hardly changed from the traditions of Hippocrates and were primarily the concern of physicians, focusing on patient welfare and medical professionalism. By the 1960s, advances in science and medicine, coupled with cultural and societal

changes, particularly in the West, revealed new ethical problems. New procedures, such as kidney dialysis and organ transplantation, had the potential to save lives. Doctors now essentially had to make choices over which patients would benefit from lifesaving treatment and which should be allowed to die. During this time, the increased emphasis on individual well-being prompted shifts in traditional values in regard to sexuality and marriage, reproduction and child-rearing, and civil rights. The acknowledgment of the patient's right to retain control over his own body led to resentment of the paternalistic tendencies of medicine at the time.

In 1974, the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research was established to address human experimentation. Five years later, the commission released the Belmont Report to announce that autonomy, beneficence, and justice were the ethical principles that should guide human subject research (1979). This report has influenced bioethicists across a range of issues and disciplines besides research, with others adding additional guiding values. Building upon the Belmont Report, *The Principles of Biomedical Ethics* was presented in 1979 as an effort to create a global framework for bioethics based on the four principles of autonomy, justice, beneficence, and nonmaleficence (Beauchamp and Childress 2012). The first principle, autonomy, calls for health-care providers to respect the autonomous decisions of competent adults. The second principle, justice, holds that health professionals should act fairly when dealing with the interests of different groups or individuals in competition for resources. The third principle, beneficence, means that health-care providers should aim to promote the interest of their patients. Lastly, the fourth principle, nonmaleficence, means to do no harm.

Proponents of the four principles assert that theorists can use this framework in a variety of different cultural settings, because the principles are independent of any singular ethical theory. Critics argue that the four principles are too vague and that it is impossible to assume that a common moral language exists across different religions and cultures. Also, there is no clear way of prioritizing the principles in circumstances where they conflict.

In spite of the imperfections, the four principles are still considered a useful tool with which to contemplate moral issues in medicine and life sciences. To this day, many bioethicists agree that autonomy is the most important of these principles.

## Public Attitudes and Involvement

Specialists from a variety of different disciplines, such as philosophers, theologians, doctors, and lawyers, have always inhabited the field of bioethics. In recent times, the efforts of social scientists have also become increasingly important to bioethical research. Social scientists can survey members of the public to gain perspective on their views of new advances in biomedical science.

Many religious communities have developed their own guidelines on how to deal with bioethical issues from the viewpoints of their particular faiths, and, in fact, there exists large collections of literature on these matters based on Muslim, Jewish, and Christian points of view. The separation of religion and philosophy does not prevail in most non-Western cultures. For example, Buddhist bioethicists tend to approach bioethical matters in an objective, logical way. Meanwhile, according to Sarma, although authors suggest that Hinduism supports lifesaving measures such as organ transplant, one cannot make any generalizations about the Hindu view of bioethics (2008). In many Latin American and African countries, where political power relations and poverty are major concerns, bioethics often focuses on what is practical and realistic. Meanwhile, Morioka contends that the bioethics movement in Japan started with feminists and disability advocates in the 1970s, and in the academic sense in the 1980s, as supported by discussions on brain death and disability appearing in the literature at that time (2015).

A report from the British Nuffield Council on Bioethics determined that the following

challenges have led international institutions to emphasize a need for public involvement activities (PIAs) in an effort to educate the public of emerging issues: the diverse public views on the implications and values that go along with emerging biotechnology, the uncertainty about outcomes, and the concern of creating dramatic changes to societal practices (Lander et al. 2014). The problem with current PIAs is that they are quite variable in terms of not only the methods used but in the choice of wording and objectives as well. Consistency in PIAs could be useful for policy development; in this case, the authors recommend specific reporting guidelines to help in this regard (Lander et al. 2014).

## Bioethics Commissions

Until guidelines are developed to ensure uniformity in PIAs, a variety of bioethics commissions worldwide are engaging in public policy and education initiatives. This is crucial to the formation of sound public policies on complex issues.

At the national level, programs, such as those encouraged by the United States' Presidential Commission for the Study of Bioethical Issues, have been established to educate the public of such advances, in the hopes of increasing public participation (2016). Other examples of national organizations involved in policy making for bioethical issues include the previously mentioned British Nuffield Council on Bioethics, the National Consultative Bioethics Committee in France, and the Danish Council of Ethics in Denmark.

The United Nations Educational, Scientific and Cultural Organization (UNESCO) is an intergovernmental organization with 193 Member States aimed at improving the ethics framework for science and technology. In 2005, UNESCO adopted the Universal Declaration on Bioethics and Human Rights, in an effort to address bioethical issues relevant to humans while also considering their environmental, legal, and social aspects. The existence of these sorts of committees demonstrates the rise of political influence of bioethics.

## Global Considerations

In the twenty-first century, much discussion is underway regarding the likelihood of global bioethics policies that would reflect the values and traditions of non-Western societies. While some bioethicists contend that global bioethics could be based upon the four-principle approach, others argue that this is not appropriate because some of the values, particularly autonomy, reflect especially Western concepts. In Western societies, autonomy is understood to be a matter of individual patient choice, where in other settings, it is presumed that family members will make decisions for seriously ill relatives. Around the world, there is overwhelming variation in the understandings of normal human activities, from birth to death and everything in between.

## Contemporary Issues

The following is a partial list of contemporary bioethical issues in science and medicine. It is meant to serve only as a small sampling of the bioethical considerations in today's world.

| | |
|---|---|
| Abortion | Medical research |
| Animal rights | Mitochondrial donation |
| Artificial insemination | Nanomedicine |
| Biological agents | Overtreatment |
| Blood transfusion | Organ donation |
| Body modification | Patients' Bill of Rights |
| Brain-computer interface | Population control |
| Cloning | Prescription drug prices |
| Confidentiality | Professional ethics |
| Consortia science | Reproductive rights |
| Cryonics | Sperm and egg donation |
| Disability | Stem cell research |
| Euthanasia | Surrogacy |
| Gene therapy | Transexuality |
| Genetically modified organism | Transplant |
| Human experimentation | Vaccination controversy |
| Infertility treatments | Xenotransfusion |
| Life support | Xenotransplantation |

While some issues are simply criticized, others, such as nanomedicine, have seemingly divided societies.

## Conclusion

Advancements in science and medicine have resulted in countless benefits to human life. While society is able to reap the rewards of these incredible biomedical breakthroughs, it is not without a price. Emerging technology brings to the forefront new bioethical issues, which must be dealt with while respecting the diverse cultures and belief systems of the global community. With public education and involvement, the development of sound public policies can commence to ensure that biomedical advances can be researched, developed, and distributed fairly and responsibly.

# Biometric Voter Registration, Zimbabwe

Sylvester Marumahoko
Department of Politics and International Relations, University of Johannesburg, Johannesburg, South Africa

## Synonyms

Constituency; Constituent; Election register; Electoral lists; Electorate; Electors; Lists of electors; Register; Turnout; Voters list

## Definitions

**Biometric:** Biometrics are physical or behavioral human characteristics that can be used to digitally identify a person to grant access to systems, devices, or data. Examples of these biometric identifiers are fingerprints, facial patterns, and voice or typing cadence.

**Voter:** Is a person who votes or who has a legal right to vote in elections, or people who are voting in a particular election.

**Registration:** With regard to elections, it is a process that establishes the eligibility of individuals to vote. In almost all countries, voters must be registered in order to be eligible to participate in an election.

**Zimbabwe:** The Republic of Zimbabwe is a landlocked country in Southern Africa that shares a border with Mozambique, Zambia, South Africa, Botswana, and Namibia.

## Introduction

Toward the end of 2017, Zimbabwe embarked on an ambitious Biometric Voter Registration (BVR) that sought to register 7,224,128 people and facilitate the replacement of the country's archaic manual voters' roll which was allegedly bloated, inaccurate, and duplicated and facilitated multiple voting, with a new biometric voters' roll. BVR is the capturing of the biometric features of a person for the purpose of creating an electronic voters' roll (IDEA 2016). A biometric register can be created at the constituency level. In most cases, however, it involves the construction of a database at national level as well as the establishment of infrastructure for data transfer and communication. The benefits of a centralized register are many: duplication of the names of voters is avoided, updating of the register is expedited, all data is stored in one server, and the need to physically transfer data from other sources to the central database is eliminated.

Facial images are some of the biometric data that can be captured (Moyo 2013). The voter's photo is either printed on voter lists or on identity cards. It is then processed and fed into the national biometric data storage facility and is used for purposes of facial recognition. The voter's ten fingerprints can also be scanned using an automatic fingerprint identification system. Fingerprint recognition is often used together with facial recognition to identify a registered voter. The iris scan is yet another method used to capture biometric data, and its advantage over the fingerprint recognition is that the eye and the iris enjoy better physical protection. An individual's electronic signature can be used to identify a voter. However, this method has its drawbacks in that people's signatures often vary. Using biometric registration kits, electoral management bodies can issue voter identification cards.

There is an increase in the number of countries using biometric registration in electoral processes worldwide. Most of the countries that opted to use biometric voter registration are in Africa and Latin America. Of the 135 electoral management bodies, 35% used biometric registration (IDEA 2016). Biometric information is also used by 25% of the electoral management bodies to verify and identify eligible voters at polling stations (IDEA 2016).

The entry assesses Zimbabwe's BVR which commenced on 10 October 2017 and ended on 8 February 2018. The entry is organized as follows: It begins by introducing the framework and procedure for BVR in Zimbabwe. Next, it discusses the shortcomings of the institutions, procedures, and processes for BVR in Zimbabwe. It then draws the lessons and implications of the Zimbabwe case for other countries intending to adopt BVR as an option to the manual system for registering voters. The entry then draws concluding remarks.

## Introducing BVR in Zimbabwe: Its Framework and Procedure

On 21 July 2017, the Zimbabwe Electoral Commission (ZEC) amended voter registration regulations. It achieved this by gazetting Statutory Instrument 85 of 2017 (also known as Electoral (Voter Registration) Regulations of 2017). This way, it assumed full control and responsibility for the voter registration, compilation, and maintenance of the country's voters' roll. Previously, this function was carried out by the Registrar General of Voters (RGV). The regulations were approved by the Minister of Justice, Legal and Parliamentary Affairs, and paved the way for biometric voter registration and the replacement of the country's notorious manual voters' roll.

Among other things, the regulations made proof of citizenship a requirement for one to register as a voter, in addition to one being aged 18 years and above. Proof of identity was listed as a Zimbabwean passport, a green waiting pass, and the national identity card. Also required was proof of residence, which, among other things, constituted title deeds, rates, water, electricity, telephone, or credit store statements showing the claimant's name and physical address. In the case of those who failed to obtain a residence document, use was made of "residence affidavits" in which a commissioner of oaths confirms their

addresses at the registration centers. The voter registration took place at the district and provincial offices of the ZEC. In addition, the ZEC could also set up mobile registration centers.

The procedure for registration began with the potential voter presenting himself or herself to a voter registration officer at any of the district or provincial offices of ZEC, including the mobile registration centers. The voter registration officer firstly determined that a claimant qualified to register as a voter. If the officer was satisfied, she/he registered the claimant by filing online a completed voter registration form (also referred to as VR1 Form). The officer then took a passport size photograph of the person and then scanned the ten fingerprints of the claimant. The only exception to the fingerprint scanning was when the claimant had an illness or was suffering from a physical injury that rendered the scanning impossible. On completion of registration, a certificate of registration as a voter was issued. The certificate indicates the name of the registered voter, identity number, serial number, polling station where a ballot will be cast, the ward number, the names of the local authority, constituency, and the district under which the voter falls.

## Shortcomings in Zimbabwe's BVR

The BVR did not go without problems. It was beset with a plethora of challenges: inadequate voter education, intimidation of aspiring registrants, unsuitable registration centers, malfunctioning equipment, "aliens" being excluded in the initial stages of the voter registration, the failure by aspiring registrants to acquire proof of residence, and a lack of transparency in the handling of data.

## Inadequate Voter Education

Voter education is as good as the tools used to promote it. The ZEC under the Registrar General of Voters (RGV), for the past three decades, mobilized and provided somewhat incoherent information on voter registration, by way of, for example, roadshows, radio shows, television, adverts, the distribution of IEC materials, and newspaper coverage. However, the suitability of some of the tools used for voter education required revision in order to address issues such as cultural needs and other impediments. For example, the print media and television are tools that are largely suitable to people in the urban areas, whereas rural communities mostly rely on infrequent radio services as a means of obtaining information on government programs. Even then, not everyone owns a radio, underscoring the need to combine various communication methods to mobilize and educate people on the requirements for BVR. The messages in the voter education campaign remained static and basic and lacked innovation toward encouraging robust voter registration. In this regard, the ZEC failed to break with a past in which voter education under the defunct RGV was more about passive information sharing and not real voter education.

Voter education, as has been the practice over the past three decades, was conducted concurrently with voter registration. The ideal arrangement was for the voter education to precede voter registration. A survey undertaken by the Election Resource Centre (ERC) showed that only 40% of the registered voters had received information on voter education before BVR (2017, p. 7). A comprehensive and robust voter education requires a program that, among other things, deals with the significance of voter registration, the requirements for voter registration, the importance of voting, and the implications of refraining from voting. It should also deal with the requirements of a free and fair election' such as the secrecy of the ballot and the independence of the electoral body.

## Insufficiently Funded and Poorly Designed Voter Education

The other problem that the ZEC encountered was that it lacked the financial resources to fully fund its voter education. Given the fact that voter education is an extensive exercise, it requires partnerships with nongovernmental organizations. It also demands immense organizational

coordination, which ZEC currently lacks. In addition, there were shortcomings in terms of the content of the voter education curriculum. For example, the curriculum did not specifically target potential first-time voters such as those who had turned 18 and were now eligible to vote (Zaba 2017). In addition, it did not tackle apathy by motivating and appealing to the younger generation of voters. The reason for this is that the ZEC did not consult with stakeholders such as the political parties and civic society organization. Furthermore, the curriculum was not professionally developed in consultation with knowledgeable individuals for such a program to speak to the needs of the different audiences such as the youth to whom more modern voter education methods would appeal.

## Intimidation and BVR

A further problem was that the voter registration was marred by intimidation, coercion, and, to some extent, subtle violence, allegedly committed by people who were sympathetic to the ruling party. They included traditional leaders, councillors, and ward coordinators on the payroll of either the local or national government. The recent BVR was no exception. The intimidation took various forms. For example, villagers were told that BVR would make it easy for the ruling party to "track voting preferences of individual voters in the 2018 elections" (ZESN 2017). It was also reported in the private media that some community leaders forced voters to submit the serial numbers of their voter registration slips and names, thus undermining the existence of a conducive environment for voter registration. There were also instances soon after voter registration when entire rural communities, including the vulnerable (widows, the sick, infirm, and destitute), were preemptively threatened with the loss of their livelihoods and land, if they voted for the opposition party as was the case in the first round of the 2008 presidential election (ZESN 2017). According to Bhalla (2012, p. 1), BVR will not achieve much, in the face of "transgressions of voter intimidations."

## The Voter Registration Centers and BVR

Another issue was the suitability of the voter registration centers. The ZEC as required by the legislation and in line with the operational arrangements in place set up 2528 (fixed) voter registration centers. They were supplemented by several mobile registration centers, including movable tents. However, not all the centers were suitable for the task at hand. The mobile tents, for example, were often prone to destruction by heavy rains, sending aspiring registrants back home. To add salt to a festering wound, some of the mobile registration centers were not connected to the power grid. Others were connected but power supply was unreliable. This affected the BVR. A further problem was that the registration centers often changed without notice, thereby creating uncertainty among stakeholders, including political formations who were mobilizing their members to register.

## Unsatisfactory Manpower and Equipment

Yet another problem was that the ZEC did not have adequate voter registration officers and equipment. Across much of the country, the centers failed to open on time. The reasons for this glitch range from a shortage of voter registration officers in the opening stages of the BVR to the late arrival of ZEC registration officers and equipment. In some centers, 7% of the equipment used in the BVR, including voter registration forms, were not always available (Election Resource Center 2017). In the first 3 days of voter registration in phase 4, 76 of the 2585 pieces of voter registration equipment malfunctioned, and delays by the technical teams to repair the equipment affected aspiring registrants (Zimbabwe Election Support Network 2017). In other parts of the country, many voter registration centers ran out of the printing paper used for issuing voter confirmation registration slips, making it difficult for voters to later on inspect the voters' roll.

## The Problems Encountered by "Aliens" in the BVR

Another problem is that people born in Zimbabwe to parents of foreign origin (i.e., the Southern African Development Community (SADC) region) and holding identity cards labelled "aliens" were not eligible to register as voters during the ZEC's BVR. However, on 29 November 2017, the High Court of Zimbabwe, following an application by Sarah Kachingwe and two political parties, the MDC-T and MDC-N, ruled in favor of people with dual citizenship registering as voters. Even then the so-called aliens still had to follow a long process before they were eligible to register. It was a requirement that they applied for the Zimbabwe birth certificate (also known as the long birth certificate) before they could register as voters. At US$10.00 an application, the cost of acquiring a birth certificate and the National Identity Document were beyond what most people could afford (Zimbabwe Election Support Network 2017, p. 2). No effort was made to waive the application fees. Pleas to waive the application fees for both documents were ignored by the Registrar General (RG), increasing the risk of disenfranchisement. To make matters worse, the ZEC made no effort to work with the RG to provide the so-called aliens with the documents needed to register as voters. It is estimated that hundreds of thousands of so-called aliens were in this predicament.

## Proof of Residence and BVR

Proof of residence was one of the documents required for one to register as a voter. For those with the required proof of residence documents, the route to voter registration was short and easily accessible. Those without the required proof of residence documents could only register after they had obtained residence affidavits from commissioners of oaths. Most of the voter registration centers did not always have commissioners of oaths to certify for proof of residence. The absence of such commissioners of oath was one of the explanations for turning away 91,643 people during all the phases of the BVR (Election Resource Centre 2017). Partisanship often characterized the issuing of the residence affidavits. For example, it was not unusual for traditional leaders to manipulate voter registration by refusing to sign the affidavit forms of people with strong allegiances to the opposition political parties. At times, aspiring registrants were taken through political education lectures before their affidavit forms were signed.

There were also reports that the signing of the residence affidavits was preceded by intimidation, violence, threats, and coercion. Some of the commissioners, including traditional leaders, charged villagers between 0.20 cents and US$5 to sign the voter registration affidavit form (Zimbabwe Election Support Network 2017). Some councillors selectively signed affidavit forms. In this regard, they refused to sign the affidavit forms of supporters of the opposition parties. A further trend that emerged was that community and political leaders (including members of parliament) dispersed presigned affidavits along partisan lines. Apolitical commissioners of oath often found themselves threatened with "unspecified action if they confirmed the residency of aspiring registrants supporting opposition political parties" (Zimbabwe Election Support Network 2017).

## Transparency

Issues of transparency, openness, and accountability were raised regarding the ZEC's transfer and transmission of data from the voter registration centers to the district, provincial, and national data centers. There were inconsistencies, irregularities, and variances, pointing to a failure to follow laid down procedures, in the way data was transferred from the BVR kits to the USB drives. In some centers the transfer was not done at the registration centers as stipulated, but at the district offices of the ZEC. There was also a shortage of equipment in some centers including USB drives. This situation was only rectified when voter registration was well underway. Furthermore, observers were often barred from tracking the data transmission process.

## The Voter Registration Figures: A Cause for Concern?

The state of a country's voters' roll indicates whether or not outcomes of elections are going to be accepted. Earlier on, it was noted that one of the reasons outcomes of elections were rejected in Zimbabwe was because there were disagreements between the ruling party and the opposition over the number of eligible people on the voters' roll. Precisely, the opposition has always pointed to the inconsistency between the number of people on the voters' roll and other official government statistics as one of the reasons for doubting the legitimacy of electoral outcomes. Seemingly, their suspicion holds water.

Nongovernmental organization working in governance and electoral reform areas have analyzed the voters' roll in the past and confirmed the existence of inconsistencies. An analysis of the voter registration figures released by the ZEC at the end of the phase 4 of the BVR and the mop-up exercise is particularly telling (see Table 1 below). The Zimbabwe Electoral Commission (ZEC) announced it had registered 5,310,734 aspiring voters, which translates to 73.5% of its official target of 7,224,128 million registered people. The voter registration missed its target by 26.5%. Another problem is that, as in the past, voter registration was low in the metropolitan provinces where support for the opposition is strong. In these provinces, voter registration averages around 60%. As shown in Table 1 below, in the Harare metropolitan province, only about 63.1% of eligible voters registered to vote. Similarly, in the Bulawayo metropolitan province, another opposition stronghold where the ruling party has endured electoral rejection for a long time, voter registration stood at a mere 59.4%. It is pertinent to note that Harare is the most populated province in the country.

According to the statistics released by ZIMSTATS, the projected voter population in the Harare metropolitan province stands at 1,345,818. In that sense, it is the only province with over one million people who are eligible to vote. It is ironic therefore that only 63.1% of these people registered to vote. The same goes for the metropolitan province of Bulawayo where voter registration only stands at 59.1%. The results of the voter registration do not seem to reflect the fact that the two metropolitan provinces are strongholds of the opposition. Prior to the voter registration, the opposition, along with its partners in the civil society organizations, carried out a strong voter education initiative. In addition, they called on their supporters to come out in large numbers and register. The figures announced by ZEC do not reflect that effort. The other reason why the two provinces are of interest is the fact that they are the only provinces in which the ruling party has been repeatedly defeated in the polls since 2000.

The state of voter registration in the two metropolitan provinces is poor when compared with voter registration in the rural provinces where the ruling party draws most of its support. Voter registration is clearly tilted toward the rural constituencies. For instance, voter registration is pegged at 83.9% in the Midlands Province, 81.5% in the Mashonaland Central Province, and 80.3% in the Mashonaland East Province. The ZEC has not bothered to explain the reasons for the disparities. The disproportionate figures would seem to suggest that people no longer have faith in the electoral system. This is not surprising given the fact that outcomes of elections have been contested for a long time in Zimbabwe and that generally ordinary people are not convinced that their votes will make a difference.

## Lessons Drawn and the Implications for BVR Elsewhere

A few lessons can be drawn from Zimbabwe's implementation of BVR. One of the lessons is that the introduction of biometrics in electoral processes has not entirely made it possible to address all the challenges involved in the modernization of national voters' rolls in developing countries. An additional lesson is that where there is trust deficiency among stakeholders involved in electoral processes, BVR can only assist to resolve challenges with the identification of voters but it "cannot, by itself, render an

**Biometric Voter Registration, Zimbabwe, Table 1** Voter registration by province

| Province | ZEC registered figures (phases 1, 2, 3, 4, and mop-up) | Provincial ZIMSTATS 2018 projected voter population | Percentage registered to date | Cumulative turned away to date (phases 1, 2, 3, 4, and mop-up) |
|---|---|---|---|---|
| Bulawayo | 243,146 | 409,389 | 59.4 | 1,887 |
| Harare | 849,128 | 1,345,818 | 63.1 | 4,652 |
| Manicaland | 693,874 | 912,762 | 76.0 | 12,663 |
| Mashonaland Central | 505,576 | 620,279 | 81.5 | 10,751 |
| Mashonaland East | 590,609 | 735,790 | 80.3 | 13,135 |
| Mashonaland West | 557,729 | 834,414 | 66.8 | 16,565 |
| Masvingo | 585,785 | 754,314 | 77.7 | 12,359 |
| Matabeleland North | 319,549 | 389,592 | 82.0 | 6,453 |
| Matabeleland South | 239,367 | 356,586 | 67.1 | 3,739 |
| Midlands | 729,971 | 865,185 | 83.9 | 9,439 |
| Total | 5,310,734 | 7,224,129 | 73.5 | 91,643 |

Source: ZESN (2017, p. 1)

electoral process reliable, credible and transparent" (Gemalto 2019). Another lesson is that biometric technology in itself will not "increase confidence in a voter registration process if, for example, the entity that conducts voter registration does not have the confidence of the populace as a competent and impartial" (Evrensel 2010).

Another lesson is that digitized voters' rolls are prone to technical malfunction, errors, tampering, and the hacking of election outcomes. In both Kenya (2017) and Zimbabwe (2018), election authorities admitted that attempts were made to manipulate the outcome of elections by hacking national servers where data was stored. Another lesson is that the security of personal data is not guaranteed. There was also a concern that personal information derived improperly from BVR had been accessed by the governing ZANU-PF of Zimbabwe and Jubilee Party of Kenya and used in political advertising and "to disseminate undesirable political SMS content via electronic communications networks" (Muthuri et al. 2018). In 2018, Cambridge Analytica, a data analytics firm based in the United Kingdom, inappropriately used personal data gathered during BVR to allegedly develop predictive models and psychographic targeting and to influence outcomes of presidential elections in favor of Donald Trump of the United States and Uhuru Kenyatta of Kenya (Moore 2018). Yet another lesson is that the prospects of BVR contributing to the realization of democratic elections are reduced if it is implemented amidst acrimony, political bickering, and squabbling as was the case in Zimbabwe, Kenya, and the Democratic Republic of Congo (DRC).

Another lesson is that BVR does not resolve issues surrounding the exclusion of certain categories of voters on nefarious political grounds. In Zimbabwe, for example, over three million citizens based in the diaspora were excluded from BVR although Section 155 (2) (b) of the Constitution of Zimbabwe protects the voting rights of all citizens, including those based in the Diaspora. Zimbabwe's BVR is not unique as it reflects the same trends seen in other African countries, e.g., Kenya and the DRC. In these countries, "technically perfect" biometric voters' registers did not necessarily deliver the political acceptance of election outcomes by the contestants prompting judicial intervention.

## Conclusion

The entry assessed Zimbabwe's BVR. After the introduction, it discussed the basic tenets of BVR. Following this was a brief discussion of the framework and procedures for BVR in Zimbabwe. It then discussed the factors undermining BVR. They include inadequate voter education, insufficiently funded voter education, intimidation, unsuitable voter registration centers, malfunctioning equipment, lack of proof of residence, and deficiencies in transparency. It also raised as an issue of concern the inconsistency between the number of people on the voters' roll and other official government statistics. Given these gaps, it was not astounding that the outcome of the 30 July 2018 presidential, parliamentary, and local government elections was disputed even though it was organized using a biometric voters' roll. It remains to be seen whether the authorities are motivated enough to address the shortcomings of Zimbabwe's biometric voter registration in order to enhance the prospects for widely accepted elections.

## Synonyms

High-order birth; Lowest-low fertility; Population policy; Total fertility rate

## Definition

| | |
|---|---|
| Total fertility rate: | The average number of children of women aged between 15 and 49 who are expected to give birth. |
| Lowest-low fertility: | A country's total fertility rate below 1.3. |
| High-order birth: | Births occurring after two or more children. |
| Population policy: | The policies and particular activities of the government that aim to influence such vital statistics as birth, death, marriage, and divorce by adopting various means to realize a sustainable population structure. |

## Introduction

The lowest-low or ultra-low fertility, the total fertility rate (TFR) below 1.3 (Jones et al. 2008; Yoo and Sobotka 2018), first emerged in South Korea in the early 2000s when the TFR fell from 1.48 in 2000 to 1.18 in 2002. This has been persistent for two decades with a further remarkable TFR decline in the last 5 years: The TFR reduced by one-third from 1.24 in 2015 through 0.92 in 2019 to 0.84 in 2020. Such ultra-low fertility will unleash a sharp reduction in the working-age population and lead to a super-aging society. Hence, South Korea's ongoing population dynamics will inevitably transform the overall economic structure and social insurance system in the future.

Since around 2005, when the government enacted pronatalist policies, both central and local authorities in South Korea have collectively implemented various population and family policies to respond to the lowest-low fertility. This action has raised skeptical critiques and heated debates on policy effectiveness. To design better policy planning, demographers have focused on identifying the causes of lowering fertility levels: the tendency of late marriage, the tempo of fertility, the decline of childbirth intentions and plans, and the improvement of educational standards. The changes in nuptiality and fertility can also be attributed to socioeconomic conditions such as economic recession and housing affordability, as well as normative and institutional contexts like gender inequality, work-family balance, and parenting systems (Eun 2007; Suzuki 2008; Yoo and Sobotka 2018).

Previous studies aptly pointed out problems suggesting solutions; however, they paid relatively little attention to the spatial dimensions of quantum changes in parity – particularly in the second or higher-order birth. As will be discussed, for instance, the comparatively low proportion of third or higher-order birth in South Korea causes its ongoing ultra-low fertility to some extent. Further, the parity-specific birth trajectory has a marked contiguity effect.

This study attempts to identify the determinants that influence each birth ranking by using the parity-specific birth data released by the Korean National Statistical Office. It also tries to examine the spatial effect of birth by employing a spatial panel regression model. A recent study dealing with birth in a spatial aspect argues that South Korea's birth tendency reveals spatial interdependence (Jung et al. 2019). We infer that such findings imply the following: one local authority's population-related policy can positively or negatively affect childbirths in its adjacent regions, thereby suggesting a mutually cooperative relationship across local authorities for implementing an effective policy.

As for the organization of this study, we will first address the trajectory of high-order births in South Korea by checking whether there exist notable spatial effects that deserve empirical tests. We then explain our data and methodology and report the results of spatial regression analysis. We finally conclude with policy suggestions.

## Research Background

The tempo effect (Bongaarts and Feeney 1998), significantly associated with changes in childbearing age of high-order birth, can be a critical factor for determining overall fertility. South Korea has maintained a significantly lower fertility rate in high-order birth than other OECD member countries. As shown in Fig. 1, the proportion of third or higher-order birth from 2000 to 2015 had been only around 10% in South Korea, consistently far below other countries. In 2015, it was 9.7%, significantly behind the 16.6% of OECD average and the 24.3% of Belgium. It could be estimated that about 30,000 more babies would have been born in 2015 if South Korea reached the same level as the OECD average. If it was the Belgian level, roughly 60,000 extra births could be expected. However, instead of an increase, the proportion in 2019 was 8.5%, decreasing by 1.2 points compared with 2015. This trajectory further indicates that the central and local governments of South Korea have failed to provide adequate policies for increasing high-order births. As such, it is essential and worthwhile to conduct active research and

**Birth Trajectory and Population Policy in South Korea, Fig. 1** The proportion of third or higher-order births in OECD member countries

in-depth reflection on why South Koreans do not give birth to as many children as other OECD member countries.

As a result of socioeconomic development, the fertility decline below the replacement level is an unavoidable and universal phenomenon. Sociodemographic structure and economic environment could influence fertility. Becker (1992), who studied fertility from an economic perspective, viewed the decrease in childbirth as an inevitable phenomenon due to changes in the value of children. In other words, the qualitative rather than quantitative aspect in raising children becomes more and more emphasized (Becker and Tomes 1976). The emphasis on this qualitative aspect comes with an increase in education and child support costs, which eventually leads individuals to follow the trend of small-sized families. Meanwhile, van de Kaa (1987) and Lesthaeghe (2010, 2020) have theorized the Second Demographic Transition (SDT) to make sense of the global spread of sub-replacement fertility and aging. Their hypothesis of intercultural diffusion has already been confirmed throughout Europe, Latin America, and East Asia and is expected to accelerate in the future. These theories, however, do not generally consider the geographical aspect of fertility.

We adopt a new approach that takes a spatial effect into consideration to make a better account of the determinants of lowest-low fertility in South Korea. We also consider some recent studies that explored geographical dimensions to elaborate our research scheme (Jung et al. 2019; Kim and Kim 2020). To begin with, we test whether the spatial effect is present by calculating Moran's *I* and mapping out interregional clustering patterns.

Figure 2 shows the results of analyzing the regional autocorrelation regarding total crude birth rate (CBR) in 2016. This demonstrates that considering district-level births is necessary for examining fertility patterns: Moran's *I* value is 0.349, showing a positive correlation. The map further visualizes the locus of significant autocorrelation in the Seoul Capital Area (left upper region), Gangwon (right upper region), and Chungcheong-Honam (left middle region). This means that regions with solid autocorrelation are spatially clustered together. Moran's *I* values by order-specific CBR – the first, second, and third or above – are 0.385, 0.320, and 0.246, respectively; they all indicate a clumped pattern rather than a random one.

**Birth Trajectory and Population Policy in South Korea, Fig. 2** Spatial autocorrelation in total crude birth rate as of 2016

## Data and Method

In addition to spatial contiguity, we assume that some other demographic factors such as marriage, divorce, the female population of childbearing age, and female first marriage age also influence the composition and changes in parity-specific fertility. Hence, we include these four elements as independent variables as follows: the female population of childbearing age (15–49 years old), female first marriage age, number of marriages, and number of divorces. Our four dependent variables are total birth and three parity-related births categorized as first, second, and third or higher birth order. We construct spatiotemporal panel data with 3859 observations derived from 227 administrative districts in South Korea from 2000 to 2016. These data allow us not only to conduct a time-series analysis but also to identify spatial effects.

All the variables employed here are converted from the numbers into the rate of change to standardize our panel data. They refer to the percentage change from the previous year. The formula for calculating the rate of change is as follows.

$$\Delta v_t = \frac{v_t - v_{t-1}}{v_{t-1}} \times 100$$

Table 1 is the result of descriptive statistics. First of all, the mean of all four birth-related independent variables is negative, which denotes the fact that local district-level births, particularly the second birth, are on average decreasing in South Korea. It is also noteworthy that the standard deviation of annual changes is the highest at the variable of third or higher-order birth, which demonstrates a significant variance between regions and legitimizes the analysis using geographical information to reflect regional disparity. Meanwhile, the mean of two independent variables that increase fertility – female population of childbearing age and number of marriages – is negative. By contrast, the mean of two variables that would play an essential role in fertility reduction – female first marriage age and number of divorces – is positive.

As mentioned, our study strives to identify whether the effect of spatial contiguity on fertility changes is present. We, therefore, construct a

spatial weighting matrix using the district-level geographical information of South Korea. We then apply the queen method by assigning adjacency, in which the weight of each region is normalized to be 1. The spatial term ($\rho w$) in our regression model is derived by substituting the dependent variable into the spatial weighting matrix. The spatial weighting matrix ($w$) is as follows:

$$i \text{ region's } w = [w_1 w_2 \cdots w_{227}]$$

$$\text{Nomalization of } i \text{ region's } w, 1 = \sum_{j=1}^{227} w_{ij}$$

$$w = \begin{bmatrix} w_{11} & \cdots & w_{1j} \\ \vdots & \ddots & \vdots \\ w_{i1} & \cdots & w_{ij} \end{bmatrix}$$

Prior to the regression analysis, we also conducted two panel unit root tests to assure the robustness of our dataset. These tests prevent spuriousness and derive accurate results. Table 2 shows the results of testing each variable. There is no unit root in both the Levin-Lin-Chu (LLC) test assuming a long time series and the Harris-Tzavalis (HT) test assuming a large cross-section. We, therefore, conclude that our data are stationary and ready to conduct regression analysis.

## Results

Table 3 shows the results of regression analysis for total birth and first birth. According to the changes in both the Akaike and Bayesian Information Criterion (AIC, BIC), the spatial panel model significantly improves the goodness-of-fit compared with panel regression. This confirms the findings of Fig. 2 that our dependent

variables are spatially interdependent. In the spatial panel model, the effect of the spatial term ($\rho w$) is statistically significant for both dependent variables. Further, two independent variables of childbearing age and the number of marriages are statistically significant in total and first births, while the other two do not manifest any significant observations. Hence, the rising trend in women's first marriage age does not necessarily lead to significant fertility changes in South Korea, albeit it negatively affects the annual changes of first birth as shown in its coefficients (−0.119).

Table 4 renders the results of panel regression analysis with and without the spatial term for second birth and third birth or higher. The effects of spatial contiguity also play a role in both dependent variables. In the second birth, all variables except divorce have a significant effect. In addition, the female population of childbearing age and marriage are statistically significant in the annual change of third or higher-order birth.

In summary, according to the regression coefficients of spatial effect, the second birth (0.908) is the strongest, followed by the first birth (0.892) and the third birth or higher (0.828). Indeed, the average annual fertility decline is the highest in the second birth, as discussed in Table 1, and this trajectory is strongly associated with regional interdependence. Further, three variables – spatial effect, marriage, and the female population of childbearing age – are vital determinants of birth order-specific fertility in South Korea. Among them, the effects of the spatial term are higher than those of marriage in all regression models. The issue of contiguity is more severe than nuptiality, the situation of which leads to our conclusion on the importance of population policy at the local level.

## Discussion and Conclusion

Our study aims to track the birth trajectory in South Korea during this century with an emphasis on a comparatively less discussed issue – the geographical impact on fertility. Based on our analysis of district-level panel data from 2000 to 2016, we argue that the changes in order-specific fertility of South Korea are spatially contiguous,

Note: $^{*}p < 0.05$, $^{**}p < 0.01$, $^{***}p < 0.001$

and this spatial effect is stronger than the regional variations in nuptiality.

Such results bear a vital policy implication: The pronatalist policy of local government needs to be cooperative to cope with the spatially clustered trend of ultra-low fertility systematically. So far, however, the pronatalist programs of local authorities have been implemented sporadically and inconsistently. The current situation is that there are certain administrative and fiscal limits to the capabilities of specific areas launching successful childbirth promotion policies. What makes the situation even worse is that each local authority presupposes the necessity of establishing policy countermeasures in competition with neighboring regions. In this respect, South Korea's ongoing lowest-low fertility can be attributed to a more considerable extent to the consequence of government failure.

We thus suggest that a cooperative pronatalist policy implemented horizontally among neighboring administrative districts can to some degree mitigate the issue of lowest-low fertility in South Korea. Further, the system of vertical cooperation between central and local authorities should be forged in a more effective way. Given that the problem of fertility reduction is the most salient in the second birth, and the proportion of third or higher birth order is far below other OECD member countries, the South Korean government needs to pay more attention to the second or higher-order birth trajectory and devise some innovative policy alternatives to break the status quo.

# Boards of Directors in Nonprofit Organizations

Stephen R. Block
Lone Tree, CO, USA

## Synonyms

Governance; Governing boards; Trustees

## Definition

Boards of Directors: Directors are individuals who govern an organization and responsible for establishing policy.

## Introduction

Boards of directors in nonprofit organizations consist of individuals who assume legal responsibility to govern and control the affairs of either tax-exempt or nonexempt nonprofit organizations. They operate as a collective for purposes of decision-making and conducting the affairs of their nonprofit during regular or special meetings. In other words, no single board member can make decisions for the organization unless the board has agreed to such delegation of authority during the course of a legitimately held board meeting and in concert with their own rules that are known as corporate bylaws (O'Connell 2003).

## Roles and Responsibilities

Nonprofit boards must make weighty decisions that impact programs designed for a constituency in need of certain services. In the USA, one of their most important decisions is to pursue tax-exempt status through the submission of an Internal Revenue Service (IRS) Application (Form 1024). In doing so, the board must decide whether the organization should be organized for one of the following reasons: charitable, educational, religious, scientific, literary, fostering national or international sports competition, preventing cruelty to children or animals, and testing for public safety (Block 1998).

Whichever purpose is selected, the following board responsibilities apply:

- Ensuring the establishment of an organizational mission
- Setting policies and adopting plans for the organization's operations
- Approving the budget, establishing fiscal policies and financial controls, and monitoring the financial position of the organization
- Providing adequate resources for the organization, establishing resource development goals, and demonstrating a commitment to fundraising through personal giving and soliciting others
- Developing organizational visibility through networking in the community
- Ensuring that the organization's corporate and governance documents are updated and secured and all reports are filed with regulatory agencies, as required
- Recruiting and selecting new board members and providing them with an orientation to the board's business
- Recruiting, hiring, evaluating, rewarding, or terminating, if necessary, the executive director of the organization

- Protecting and preserving the organization's nonprofit tax-exempt status.

The idea of a board of directors is a complex concept. For example, an interesting and sometimes confusing aspect of nonprofit boards of directors is how they are distinguished from the governing bodies of for-profit companies and governmental organizations. For-profit corporations that issue stock are referred to publicly traded companies that operate in the private sector. Members of the general public can purchase shares of stock in publicly traded companies to gain some percentage of ownership, allowing the stockholder to vote on issues presented during the corporation's annual or special meetings. Members of corporate boards are usually handpicked but approved by the stockholders. Frequently, members of corporate boards are compensated for their participation, and stockholders may also earn dividends from the company's profits. In contrast, the board of a nonprofit organization may not receive a distribution of the organization's profitable revenues and as a practice does not receive payment for their board service. Since nonprofit organizations do not issue stock, there are no owners in the traditional sense. In contrast, members of a nonprofit board engage in a self-perpetuating process of selecting board prospects and voting to add or replace board positions during regularly or specially held meetings. There is an exception for membership organizations, such as professional associations and unions in which the members are entitled to vote on a slate of board candidates.

Although nonprofit organizations engage in activities for the public good, the Internal Revenue Service determines whether a nonprofit will retain its tax-exempt status based on a formula that measures the level of support donated by the general public. Although reliant on the public, nonprofit organizations are private entities and not public corporations. As part of the review of an application for tax-exempt status, the IRS seeks evidence that a nonprofit board will adhere to a "nondistribution" constraint and "inurement" prohibition. Individuals in control of the organization may not directly or indirectly benefit from the distribution of organizational profits or assets. This restriction is an essential difference between a nonprofit organization and a for-profit corporation. Finally, upon dissolution of the tax-exempt organization, the IRS requires through a statement in the application for tax exemption that none of the assets of the company will inure to the benefit of board members, staff, or other individuals. Instead, the applicant organization's board must agree that upon its dissolution, its assets will be distributed to one or more tax-exempt entities or to a government agency. Public sector organizations have different types of governing bodies, and almost all are elected to their position by a publicly and politically supported voting process. They include city council, county commissioners, state and federal legislators, school boards, and others. The similarities with nonprofit boards are few but do exist. They all operate as a collective, vote on policy matters, and serve in the interest of a community.

The number of board members, the frequency of meetings, and the responsibilities of members and officers are outlined in a nonprofit organization's bylaws. Bylaws should be written to address the individual and specific governing responsibilities for a nonprofit organization. However, many nonprofits copy from other existing nonprofits or from books and do not give homage to the importance of this governing document. Boards should identify the organization's special niche and write its bylaws accordingly. If a board is unable to distinguish their nonprofit purpose from other nonprofit organizations, the board needs to decide whether there are unmet needs that would warrant an additional nonprofit in their community.

It is not uncommon to read books and journal articles that describe tension between board members and their paid staff, that is, executive directors (Golensky 1993). In most cases, conflict may exist due to ambiguity about leadership and management roles (Eadie 2008). The roots of conflict may also result from the nature of boards being a social construction that has roles and responsibilities, but not uniformly the same from organization to organization. Additionally, there are usually no extraordinary requirements to be

invited to serve on a board of directors. Consequently, most individuals who serve on boards learn their role by observation and not by being educated on how to function as an effective governing board member. The actual burden of being a board member is generally not acknowledged in the literature, and there are many expectations that are placed on board members that need to be met to prove they are effective and responsible leaders.

Part of the challenge for board members wanting to fulfill expectations to be considered effective is balancing board obligations with personal demands of work, family responsibilities, or other community activities. Board members do pay a personal price by spending time away from their family, work, and friends on top of giving money to support a wide range of mission-oriented programs, such as mental health, child welfare, developmental disabilities, refugee resettlement, homelessness, hunger, and aging. As a result of this type of kindness and generosity, governing boards of directors have become the bedrock on which nonprofit organizations have come to rely on. Also, the general public and government agencies such as the Internal Revenue Service rely on the board of directors to be accountable for the performance and fiscal health of the organization. While the board may delegate management authority to a paid executive director, the board can never be relieved of its legal and fiduciary responsibilities. Since tax-free revenues come from the general public as donations from individuals, foundations, and corporations or from government grants and contracts, the boards of directors are accountable to the taxpaying public through federal regulations and state corporate statutes. Governing board members are fiduciaries of the public interest and have a burden of responsibility to use and preserve the organization's assets for advancing the purpose of the organization.

In addition to adhering to a "nondistribution" constraint and "inurement" prohibition against aggrandizing one's own personal assets, board members have additional requirements to have their organization become tax exempt or to retain its tax exemption. They must ensure that their organization will not participate (for or against) anyone's campaign for public office. In the eventuality of the board deciding to close and liquidate the organization and its assets, the IRS wants assurances through a statement in the application for tax exemption that none of the assets will inure to the benefit of board members, staff, or other individuals. Instead, the board must agree that upon the organization's dissolution, its assets will be distributed to one or more tax-exempt entities or to a government agency.

## Board Composition

Many board problems are the result of how individuals are identified and recruited as board prospects and eventually elected to share in governing responsibilities. Some boards approach the recruitment process as a casual chore and resort to selecting friends, co-workers, or anyone expressing an interest in serving. Board composition should result from purposeful recruitment strategies. The task of filling vacancies on the board should be approached carefully, resulting in a board composition that is able to advance the organization's mission. There are two preparatory steps to actively recruiting the "right" person. The initial step is to recognize that organizations go through different stages of development, similar to the life cycles experienced by individuals. Various maturational stages lead to differing organizational issues and needs. Being able to assess which phase an organization is in can be useful for preparing the organization for change and determining the leadership qualities required of potential board members. Matching an organization's life cycle to the indispensable knowledge and skills needed of a board member could lead to more effective and purposeful organizational outcomes.

A second step is to conduct a thorough demographic inventory of the board to identify the board's weakest representational areas. Inventory results will show a compositional balance or imbalance in such variables as gender, age range, ethnicity, socioeconomic status, political party affiliation, educational level, professional or vocational interests, knowledge of consumer issues, and location

of primary residence. Information of this type can be valuable to organizations especially seeking to create a diverse board.

Composition of the board can contribute to the level of ease or difficulty with which an organization is governed and managed. A board composed of individuals with similar socioeconomic backgrounds or other familiar traits may reach consensus more often, but homogenous groups are less likely to formulate challenging ideas or seek out policy reforms. Diversity among the board members can create greater participatory challenges with differing values, mores and interpretation of community information, and beliefs. However, as a result of the various ways an issue can be examined by a diverse board, participation can enrich the quality of a board's work.

To be an effective decision-making body, it is important that time is devoted to briefing candidates to the issues and expectations of the board. They should be introduced to the organization's purpose, mission, vision, goals, and objectives. In addition, they should be informed about board duties, responsibilities, and any of the expectations that the organization has of its members. When this type of information is properly conveyed, it becomes easier for the candidate to judge whether she/he has a real interest in joining the board and can make an informed decision and commitment. There should be no surprises emerge after the candidate is elected on to a board member. For example, the prospect needs to know if there are expectations to raise money, donate money, serve on committees, use their personal contacts, or apply their vocational skills in lieu of hiring an expert. It is always advantageous for the board to screen candidates and determine if there is a good fit with the personalities of the existing board. During discussions with board prospects, their reactions can be observed and used as information to weed out individuals who are not likely to make a strong commitment to board service. Also, board prospects can appropriately self-select out of the recruitment process when they have an understanding of what is truly expected of them.

Board prospects should be given relevant information that will allow them to make intelligent and informed decisions about participation. An invitation to observe a board meeting and an introduction to board members are ways of sharing information. Another tool for information sharing is a board-prospecting packet which may contain some of all of the following documents:

- A history of the organization
- Board job descriptions
- A copy of the articles of incorporation
- A copy of the bylaws
- A copy of the organization's purpose/mission statement
- An organizational chart
- A description of program services
- A list of committees and duties of each
- A roster of the current board with work affiliations, addresses, and phone numbers
- Dates of future meetings and special events
- An annual report
- Organization brochures, newsletters, or related materials
- A copy of a recent auditor's financial report, annual budget, and financial statements

It may also be helpful to assign a veteran board member to assist the prospect in "learning the ropes." The availability of a support person may encourage the board prospect to join a concerned board of directors. The veteran could serve as a resource person during the recruitment phase and then as a mentor during the transition period following induction.

Composition is important, but there is no perfect formula for determining the appropriate size of an organization's board of directors. The size of the board must be tailored to suit the needs of the organization. The number of people serving on a board can be a factor that influences how board members comport themselves. Large boards are generally unwieldy because it is difficult to pay attention to so many people. Because the larger group will find it more difficult to become cohesive and familiar as a cohort, it may tend to be more formal in its board conduct and meetings. Organizations which are just starting out, or those in need of a boost in financial resources, may be better served by a larger board of 20–25

individuals. In this case, the larger the number of board members, the greater the chances of reaching out to potential donors.

Smaller boards mean fewer individuals to devote time and effort on supportive activities. However, smaller numbers also have certain advantages, such as:

1. Fewer obstacles for achieving group cohesion
2. Learning how to mesh effectively their collective wisdom, advice, and counsel
3. Reaching decisions without the need for parliamentary procedures

## The Role of Board Officers

The officers of the board of directors have a responsibility to set the tone for organizational leadership (Block 1998). The duties of the president or chairperson (Harrison and Murray 2012), vice president, treasurer, and secretary are described in the organization's bylaws:

1. President – In most nonprofit organizations, the title and position of president refer to the highest level volunteer who also serves as chairperson of the organization. In some nonprofit organizations, a corporate model of governance is followed; therefore, the title of "president" replaces the more commonly used title of "executive director." If the president is also the paid chief executive, the position usually allows for participation as a board member. In this instance, the role of chairperson is handled by the chief volunteer.

   Traditional models of board governance would have the volunteer president/chairperson be responsible for the activities of the board and for assigning board committee chairs, unless assignments are automatically spelled out in the bylaws. The chairperson is responsible for monitoring the work of the board and evaluating the board's performance. The chairperson calls and presides at special meetings of the board and sets the direction for organizational goal setting. This volunteer position requires a great deal of time commitment and responsibility.
2. Vice President – In the absence of the volunteer president, the vice president usually assumes the duties of president and the responsibility for chairing board meetings. Oftentimes, the role of vice president entails chairing a major committee of the board. In some organizations, the vice president automatically becomes president-elect, a succession plan that may not be effective in all organizations. The position of president should be earned by leadership performance, commitment to the mission, and proven governance abilities. Service as vice president does not assure that the individual would be a suitable president and board chair.
3. Secretary – The board secretary has the obligation to protect the organization's corporate documents, such as the bylaws, the articles of incorporation, board and committee minutes, and important correspondence.

   Many individuals try to avoid election to the office of secretary because of the myth that the board secretary must take the minutes of the board and executive committee meetings. The board secretary does not have to write the minutes, but he/she is responsible for ensuring that the minutes are taken and accurately reflect the business meetings of the board and executive committee. To accomplish this assignment, the board secretary may want to take the minutes or rotate the responsibility. In some organizations, a paid staff person takes the minutes. In this case, the secretary might review a draft before it is circulated to the full board. Upon becoming official records of the organization, the board minutes should be signed and dated by the board secretary. In organizations that rely on parliamentary rules and procedures for conducting board and committee meetings, the board secretary is required to become familiar with the meeting procedures and may have to make procedural rulings.
4. Treasurer – The treasurer should not be expected to do the bookkeeping and accounting for the organization. Instead, the treasurer

is responsible for making sure that the organization's finances are properly accounted for and excess revenues are wisely invested. If a finance committee exists, the treasurer often serves as its chairperson. On behalf of the board, the treasurer ensures that financial controls are in place and tested on a periodic basis. The treasurer also participates in the selection and recommendation of an auditing firm. The treasurer reports on the financial statements at board meetings, at executive committee meetings, and, if applicable, at annual meetings of the organization. While an accountant or banker is often recruited to serve as the treasurer, the position does not necessarily require a professional background in accounting or finance. The treasurer should understand finances and be able to articulate the financial issues of the board.

## Successful Governance

Despite a board's shared beliefs in the mission of their nonprofit organization, boards of directors can face challenges in their ability to achieve their strategic goals. The key obstacle is usually a lack of understanding of their governing roles and responsibilities and unfamiliar with three standards of conduct that can be found in most state statutes on incorporating nonprofits, as follows:

1. Duty of care – imposes an obligation that all board members discharge their duties with the care that an ordinarily prudent person would exercise under similar circumstances. This includes being diligent, attending meetings, and becoming acquainted with issues before reaching a decision.
2. Duty of loyalty – requires that each board member acts primarily in the best interest of the organization and not in their own personal best interest or in the interest of individuals at the expense of the organization.
3. Duty of obedience – imposes an obligation that board members will act lawfully and in accordance with the organization's mission.

Acting prudently, lawfully, and in the best interests of the organization can, in part, be achieved with the following best practices:

1. Becoming an active board member. Board members who are familiar with the organization's mission and purpose are generally able to make better decisions for the organization. Revisiting the mission annually also serves as a reminder that the board's decision-making uses the mission statement as a guidepost.
2. Attending all meetings. It is unrealistic to believe that a board member will never be absent from a meeting. However, being absent will not excuse a board member from the decisions reached by those in attendance. In fact, absence from meetings increases potential risk because the board is making decisions without the benefit of views from all of its members.
3. Insisting on having sound financial management tools and control systems. Board members need to learn how to read and use financial statements and audit reports for understanding and monitoring the organization's fiscal health. Board members also need to understand how their decisions have a financial impact on the organization.
4. Speaking up. Board members should not remain silent when they disagree with a decision item or an opinion expressed by others. Additionally, board members should ask questions when the organization's goals and objectives are not being met.
5. Identifying conflicts of interest. Board members need to reveal any real or perceived conflicts of interest and avoid participating in discussions and decision-making related to those conflicts. Faced with an actual conflict or the perception of one, the board member must inform the other directors during the course of a meeting. The minutes should identify the board member and his or her recusal to participate.

   A best practice is to have a conflict of interest policy in the bylaws, and annually board members and executive management staff should sign a form that would indicate

adherence to the policy and whether there exists a real or perceived conflict of interest.

6. Staffing. In addition to having personnel policy guidelines for the executive director, the board must be certain that all personnel policies are adequate and updated to reflect all applicable mandates of law. In practice, the responsibility to ensure the adequacy of the personnel policies would be the organization's director of human resources, who along with the executive director would present updated policies to the board for their review and adoption.

Some nonprofits also entertain additional groups of leaders and may refer to them as a board, an advisory board or an honorary board of directors. However, unlike governing boards they do not shoulder the legal burden of a governing board. An advisory board exists to assist the governing board or the executive director in examining issues and recommendations. However, recommendations that result from the work of an advisory board do not have to be accepted or followed by the executive director or governing board.

Honorary boards are much different than governing or advisory boards. They usually are composed of individuals who are well known because of some measure of celebrity or prominence in the community. Honorary boards do not necessarily meet. In fact, some individuals agree to serve as honorary members because they do not have the time or inclination to attend meetings. Individuals serving in this honorary capacity lend credibility to an organization by allowing the use of their recognizable names in brochures and on letterhead. Sometimes, members of honorary boards and advisory boards are enlisted to assist in organizational fundraising activities. The visibility and credibility of the honorary member or advisory member send a signal to the community that the organization is worthy of the public's financial support.

## Board Models

Over the last three decades, nonprofit board scholars have been studying methods and practices that can lead to more effective governing boards. These efforts have led to the application of theories to explain board performance to prescriptive writings that inform on how to manage and govern (Miller-Millesen 2003; Brown 2005). For most executive directors and board members, the existence of board models remains unknown. Knowledge and the application of board models require reading peer-reviewed journal articles, books on boards, or attending courses taught by consultants or more formal higher education degree or certificate programs in colleges and universities (Tsui et al. 2004).

Board models provide a framework albeit theoretical that can be used to plan, problem-solve, and conduct everyday affairs for management and the board. Some models stress the involvement of client representation, focus on innovation, fluid structural changes, or incorporating nonboard members in governing decisions (Bradshaw et al. 2007).

Miller-Millesen (2003) used three theories of organization – agency theory, resource dependence theory, and institutional theory – to examine board roles and responsibilities, recognizing that each theory has a different focal point for explaining board behavior. Also, Brown (2005) used survey research to investigate the relationship between six dimensions of board performance with three organizational theories (agency theory, resource dependency theory, and group/decision process theory) to help determine how board governance activities influence organizational performance. His research recognized the importance of building a team mindset with a focus on interpersonal connections.

Four board models have received more attention than most because they represent a clear division of scholarly thought within the nonprofit board literature (Houle 1989; Carver 1997; Herman and Heimovics 1991; Block 1998, 2015).

Houle was one of the early writers on the subject of nonprofit boards, and his work has become a classic that is often referred to as a "traditional model." He appreciates the executive director/board chairperson relationship but

considers the board chair to be the most important figure in the organization. A major attribute of the traditional board model is Houle's belief in a hierarchical arrangement with the board in a dominant position, and the executive director is in a subordinate position. Houle's seminal ideas about hierarchy and control have shaped generations of scholars' and consultants' beliefs about the chain of command in nonprofit organizations.

John Carver's (1997) Policy Governance Model agrees with Houle on the board being in charge. Carver's model is popular and easy to understand and has filled a need for board members who were confused about the board's roles and responsibilities and how to implement them. He defines the board's role as creating all policies and not taking any policy suggestions from organizational staff and management. The board sets the organizational goals and objectives (the "ends"), and the executive director determines how the ends will be achieved (the "means"). Carver's approach gives the executive director latitude to determine how the ends will be met, providing that the board has not issued a policy limiting how the executive director can do his or her job to accomplish the ends. In Carver's model, restrictions on the executive director come in the form of executive limitation policies. As in the Houle model, the board leads the organization, speaks with one voice, and delegates operational matters to the executive director. The executive director is evaluated on the basis of complying with the board's policies and achieving its ends.

Prescriptive directions can be quite helpful to board members who have uncertainties about what is expected of them. However, over the years too much structure and direction have led to an expectation overload and a burden for volunteers who are unable to meet all of the traditionally expected demands of their board role – that they must fulfill to be considered responsible and effective. For traditionalists, an inability of a board member to adhere to all of the board expectations is symbolic of a lack of commitment, a lack of leadership, and an imprudent way of conducting board business. It is the acceptance of this platform of ideas that led to the critical remarks of executive directors (and some board members) about a board member's questionable allegiance as exemplified by absenteeism, fundraising phobia, or other unmet expectations.

Board models that are non-traditionalist oriented suggest that there are flaws in the structural design of the traditional and policy governance models. The specific concern is the attribution of governance effectiveness being a derivative of the leadership hierarchy with the board in the dominant position. One of the earlier departures from the notion of dominance over the executive director was a model known as "conjoint directorship" (Leduc and Block 1985). It challenged the central ideas of hierarchical models of board governance. The authors called for a team approach with both governance and management roles being assigned to the most appropriate board member or manager. Through their research, Herman and Heimovics (1991) identified the executive director as central to advancing the work of the board. Their board-centered model is based on the executive director's focus to help the board achieve its objectives. As a result of their findings, the executive director's leadership role became a dominant theme in understanding the effectiveness of nonprofit boards and organizations.

The emphasis on the executive director being fully responsible for the success of the board is rejected by the traditionalists and adherents of the policy governance models but is the central theme in the executive director-concerted leadership model that has evolved into the relationship model that places emphases on understanding motivational theories and its use in encouraging and supporting board interaction.

## Boards in NGOs

Most developed countries throughout the world have tax policies that allow for nongovernmental organizations (NGOs). The term NGO is to represent that the organization is a nonprofit

organization that is independent of government. While NGOs may not be an administrative arm of government, in some countries they are dependent on government for funding or to be sanctioned as a legitimate entity that is allowed to operate in their locality. As in the USA., issues of organizational accountability are a common concern among NGOs (Lewis 2014). An essential ingredient to achieve effective outcomes is the important role of boards of directors (Jaskyte 2015). In the case of NGOs, Rajesh Tandon (2014) describes a number of board of director issues which are similar to those described in the board literature published in the USA.

## Conclusion

The roles and responsibilities of a governing board of directors in nonprofit organizations are often overlooked or misunderstood. Given the legal responsibilities that board members assume, it is essential that the board has a working knowledge of its bylaws and a keen understanding of their duties of care, loyalty, and obedience. To be an effective board member in the USA or in other countries, each board member must fully participate through attendance, reading documents, examining financial statements, and not voting on any matter or recommendation unless he or she understands the issues and implications of a final decision.

## Definition

### Boko Haram

The word "Boko Haram" is derived from Hausa language, meaning that Western education is a sin or forbidden. It is a radical Islamic group, formally christened as "Jama'atu Ahlus-Sunnah Lidda Awati wal Jihad." Its formation could be traced back to Mohammed Yusuf in 2002 in Maiduguri, Borno State – north-eastern Nigeria. Yusuf imparted extreme Islamic philosophy in the group that incongruent to Western education in the region. Western education was branded as against Sharia law. Initially, Boko Haram benchmarked Nigeria as a country governed by unbelievers, it is against this backdrop that it propagates the idea of creating an Islamic state in which the mode of governance would be entrenched in Sharia law, which was considered as capable of liberating the citizens from corrupt government, social inequality, and deprivation. The group considered the existing governance structure as against the fundamental ethos of Islamic law. Boko Haram is one of the deadliest terrorist group in the world, it has spread from Nigeria to neighboring countries such as Cameroon, Niger, and Chad.

### Defense Corruption

Defense corruption entails misuse or illegitimate use of defense budget for personal gain. It means diversion of military procurement funds into private pockets by the political class, senior military officers, or public officials.

## Introduction

One fundamental assumption in the studies of security sector reform and civil-military relations is the believe that political class is dynamically obliged to perform oversight function over the military institution. Making the issue of security a central function of government in both emerging and developed democracies of the world. In Nigeria, this cardinal function of government seems to have been threatened owing to a whole lot of reasons, mainly among whom is the insurgency of *Boko Haram* in Northeastern Nigeria. In response to this terrorists' milieu, the Federal Government under President Jonathan's administration in 2011 set up a special military taskforce consisting the army, air force, navy, the Department of State Security Service, and the Nigerian Police force. The rationale behind the creation of the joint force was basically to allow resources to be pooled, prevent duplication, and allow the free-flow of information between the different parts of the security agencies. However, the federal nature of Nigerian state and its security forces undermined the objectives behind the creation of this joint taskforce, not only by disconnecting from the assignments but misappropriating the resources for carrying out the intelligent assignment.

One of the remarkable recommendations of the taskforce was to indorse the procurement of arms for combating the insurgents in the conflict-prone

environments. Amidst other counter-terrorism strategies, the poor state of Nigerian security forces has further encumbered the national fight against insurgency; however, at the peak of the insurgents' attacks, the Nigerian presidency fashioned out modalities for the procurement of sophisticated arms to combat the restiveness in the volatile states. On the contrary, the procurement of the arms was attendant upon the military corruption. Knowing fully well that Corruption in military procurement is a very serious problem (Willett 2009), particularly for developing economies that have experienced the greatest increase in military spending since the Cold War. Nigerian example is not far-fetched from this mishap. The current economic status is, however, not surprising due to the misappropriation of the allocated funds to security sensitive assignments. The modalities for procurement seem clear-cut in most political and administrative systems, Nigeria not an exception. The allocation of 2.1 billion dollars for arms procurement is succinctly for above-mentioned security challenge in the Northeastern Nigeria.

Although, the corrupt nature of Nigerian political and military leadership has been widely considered as the reason for prolonged terrorist radicalism, it has been argued that, defense procurement is susceptible to corruption for many reasons: first, governments are disposed to be less transparent in their defense procurement as a result of security purpose; Second, military procurement does not allow for competitive market and, therefore, creates opportunity for corruption. However, corruption in defense procurement has exhibited its potentials in exacerbating conflict. It was observed to have been embedded in the fabric of conflict, both in state militaries and non-state rebels. The common practice of military patronage through corruption divulges that commanders have an interest in continued conflict, offering some stakeholders the opportunity to enrich themselves and thus providing disincentives to ending conflict. While, its economic consequences of prolonged conflict can also be enormous.

DFID's 2006 policy paper "*Preventing Violent Conflict*" points out that the average cost of one conflict is nearly equivalent to the value of annual development aid worldwide (Dunne and Haines 2001). The outlined modalities for procurement become shortchanged for the negative purposes, specifically for Presidential Election in 2015, as later exposed in the arraignment of the former National Security Adviser (Rtd. Col. Sambo Dasuki). Often, this feat seems contributory to the protracted conflicts and inability of the insurgent groups to be deradicalized by the Military taskforce. It is thus important to examine the political corruption tendencies within the Nigerian State. This entry therefore contributes to this debate; it interrogates why Boko Haram could not be tamed despite the huge resources employed into security sector. The entry provides analysis on Dansukigate scandal and why defense institution is prone to corruption and its implication on national security concern. There are two main findings. First, the major subterfuge employed for diversion of arms procurement funds was channeled through alliance formation between the political elites, the serving, and retired top military officers. Second, the persistent Boko Haram revolt has been a concealed boulevard for diversion of state resources into private coffers; therefore, ensuing the reign of terror to be more tough, lengthened, and unconquerable due to secretive benefits associated with defense expenditure enjoyed by political and military cabals in Nigeria.

## Military and Nigerian State

Understanding the architectural, occupational, and operational formation of military institution in Africa, one must first be able to provide explanation of the internal working machineries entrenched in the system. The military enjoy a relative autonomy especially in terms of recruitment, promotion, procurement of military hardwares, and logisitics. However, the military institution needs to comply with the directive and authority of the state. This implies that the key appointment within the military are subjected to the approval of the state. In many occasions, the government in power appoints all the officers that constitutes the military leadership.

Therefore, absolute loyalty requires from the leadership of the military authority. In many occasions, the political leadership of the country often prefers the military officers who share similar ethnic origin with the President. This philosophy has been employed by various political regimes – both military and civilian in Africa. Importantly, it must be recognized that African militaries are unprofessionalized, personalized, and lack institutional structure that could aid national development. It is against this backdrop that Michael Bratton and Nicolas van de Walle conclude that "authority is entirely personalized, shaped by the ruler's preferences rather than any codified system of laws" (Bratton and Van de Walle 1997). In such personalistic system, the regime in power has the absolute control of the security architecture.

African military system has been characterized as an institution where there is predominance of personal interest rather that state interest. This has been the culture of military governance in Nigeria dated back to 1966 first military coup. The many faces of corruption in Nigeria cut across all sectors without any single institution left behind when explaining the complexity of the syndrome in the country. No one has done much groundbreaking work except Daniel Jordan Smith when it comes to understanding the comprehensive interface of corruption in Nigerian social and political cycles; the military institution has been a source of capital accumulation for state managers. According to Smith (2001), he suggests that institution such as military which primarily supposed to be a protector of the people has been considered as perpetrator of corruption and injustices. The Nigeria's 30 years' experience of military rule has signified looting and personalization of state resources by the different regimes.

The political crises and politics of corruption that encircled democratic regime prior independence provides a pretext for a military coup executed by a group of young military officers on 15th January 1966 that usurped power from democratic regime. This marked the beginning of military involvement in politics and dead end of Nigerian first republic. The editorial of the Daily Times Newspaper of January 16, 1966 argued thus:

> With the transfer of authority of the Federal Government to the Armed Forces, we reached a turning point in our national life. The old order has changed, yielding place to a new one. . . For a long time, instead of settling down to minister to people's needs, the politicians were busy performing series of seven day wonders as if the act of government was some circus show. . . still we groped along as citizens watched politicians scorn the base by which they did ascend. . . (Daily Times 1966).

The prevalence of corruption among the political office holders was a direct response of military takeover. The military coup d'état led to assassination of some political leaders in the Northern and Southern parts of the country. However, despite unjust killing by military men, there were general jubilations in the country. At the inception of inauguration of military governance, General Thomas Aguiyi Ironsi who became the first military President instituted several commissions of enquiry to probe the activities of democratic government and several other agencies managed by the past political regime. The agencies include Nigeria Ports Authority, the defunct Electricity Corporation of Nigeria, Nigeria Airways and Nigeria Railway Corporation which were employed by the past political regime to execute fraudulent contracts and perpetrate corruption. The report of investigations conducted into the activities of numerous agencies found that these government parastatals were used by the past political office holders to misappropriate public funds. Moreover, the report further revealed that there was total disregard to established rules and procedures in awarding contracts and widespread corruption in the public establishment. In July 1966, another military coup was staged against the Ironsi's government which led to installation of General Yakubu Gowon as a new head of state. The Gowon's era witnessed an era of oil-boom in the 1970s; the unprecedented oil wealth consequentially enmeshed the regime in mismanagement and looting of public funds. By 1974, the prevalence of corruption in Gowon's regime became a popular debate in country. Hence, in July 1975, the political regime of General Yakubu Gowon was toppled in a military coup carried out by General Murtala Mohammed. The 1975 coup was

defensible to end ground corruption in the public sector. This regime-initiated asset declaration ethic of all public officials, the new government in power instituted investigation into the spending of past political leaders. The report of Federal Investigation Panel of 1975 indicted 10 of 12 state military governors that worked with General Yakubu Gowon of corruption. Thus, instigated the dismissal of the guilty governors from the Nigerian military service; they were also forced to forfeit all the properties acquired from ill-gotten wealth to the government.

In tandem with the above, Belgore Commission of Inquiry was also instituted to probe the "Cement Armada." The report of the commission indicted the past regime of General Yakubu Gowon of inflating contracts for cement on behalf of Ministry of Defense. According to the report, the commission observed that the Ministry of Defense needed only 2.9 million tons of cement at a cost of N52 million as against the 16 million metric tons of cement, it ordered, at a cost of N557 million. The reports of similar commission of enquiry resulted in dismissal of a number of public officials while those who have looted public funds were instructed to refund the stolen public funds. Following several indictments of public officials who have involved in looting of public resources, General Murtala was assassinated after only 6 months in office. He was succeeded by General Olusegun Obasanjo who has primarily served as his Chief of Staff during his regime. Unlike General Murtala Muhammed, General Olusegun Obasanjo did not provide a political nomenclature to prosecute the corrupt public officials. However, General Olusegun Obasanjo championed transition of power from military to democratic regime in October 1979. This era marked the beginning of Second Republic under the democratic political leadership of President Shehu Shagari. The recurrent problem of corruption implicates the government of Shehu Shagari in which more than $16 billion oil revenues were stolen from the public purse between 1979 and 1983. It became obvious common, for mysteriously flames engulfed federal government building, most especially before the arrival of investigated audit committee; thus, becomes difficult to discover written document of the fraud perpetrated by the regime in power. The inability of the Shagari's government to look into corruption allegations against his cabinet ministers led to a coup championed by General Muhammadu Buhari in 31st December 1983. The coup was carried out to rescue the country from the corrupt political leaders as well as entrenching integrity, discipline, and dignity to public arena. In the course of setting the country on a corrupt-free track, the regime was toppled by General Ibrahim Babangida in a bloodless coup on 27th August 1985. Following this event, corruption became institutionalized during the regime. According to Maduagwu:

> Not only did the regime encourage corruption by pardoning corrupt officials convicted by his predecessors and returning their seized properties, the regime officially sanctioned corruption in the country and made it difficult to apply the only potent measures, long prison terms and seizure of ill-gotten wealth, for fighting corruption in Nigeria in the future. (Maduagwu quoted in Gboyega 1996: 5)

One of the fact findings, the 1994 Okigbo Panel Report on the Reorganization and Reform of the Central Bank of Nigeria (CBN), indicted the General Ibrahim Babangida, former Head of State, for conniving with the senior public servants in the CBN to mismanage public resources allocated for developmental projects. The report further exposed diversion of public resources through operations of secret accounts. As explained in the 1988 Okigbo's report, General Babangida officially approved the diversion of crude oil of 65,000 barrels per day (bpd) dedicated for the funding of special priority projects such as Shiroro Hydro-electric, Itakpe Iron Mining, including Ajaokuta Iron and Steel projects. It is believed that the account was also meant to be used for external debt buy-back and to build-up reserves. The quantity allocated was later increased to 105,000 barrels per day and later to 150,000 barrels per day. Moreover, a stabilization account meant to accommodate the oil proceeds of the Gulf War and a Special Account for Mining Rights and Signature Bonus were opened.

Overall, between 1988 to June 1994, $12.4 billion was allocated to these accounts. By 30th June 1994, the funds received in these accounts had been siphoned, leaving a balance of $206 million (Executive Summary of Okigbo Panel Report, 1994). In the context of misrule, Babangida political administration was brought to an end by transferring power to Interim National Government (ING) led by Chief Ernest Shonekan in 26th August 1993. The Shonekan's regime was toppled in a military coup championed by General Saani Abacha in November 1993. Under the regime of late General Sanni Abacha, corruption was rooted in the public sector. It has been argued that Abacha's plundered funds have exceeded that of some of notorious African political leaders, such as Mobutu Sese-Seko of Zaire (now Democratic Republic of Congo). It was estimated that Abacha's loot was about $4 billion. Following the demise of Sanni Abacha, General Abdulsalami Abubakar emerged as new military president, the regime pledged to transfer power to democratically elected leader, however, put little commitment in the fight against corruption. Therefore, the Abubakar's regime marked the end of third republic and military misrule in the country. From 1966 to 1999, Nigeria experienced six successful coups, two aborted attempts and three alleged plots that necessitates military trials and sanctions. No more than 117 personnel were assassinated in the various attempted, failed, and successful coups. Some of the coup leaders who employed their offices for personal enrichment provides a philosophical tenet that officers were only interested in siphoning public funds. Incontrovertibly, corruption became pervasive during the military regime, and despite the transition from autocracy to democracy which raised peoples' aspiration for good governance, corrupt practices continued to escort the vehicular movement of Nigerian democratically elected political regimes. This therefore challenge the efficacy of democratic theory as capable of safeguarding good governance in Africa, it can therefore be argued that some of the leaders that were presented for democratic occupation were still the same corrupt military leaders who have retired from service, therefore, recruiting and recycling the unapologetic military men into democratic space, and simultaneously, sowing, propagating, and conveying the seed of corruption into Nigerian democratic landscape.

## Corruption and Political Environment of DasukiGate Scandal

The existing evidence regarding the character of Nigerian state demonstrates that corruption serves two crucial primary purposes: to preserve power through electoral manipulation and political patronage. Power preservation mechanism include the allocation of government contracts and distribution of jobs to powerful individuals who have the capacity and strength to influence electorates and these strategies are employed to buy political support from the big men and political associates. The entrenchment of these social norms formed the basis of Nigerian political economy. Under President Goodluck Jonathan's regime, such credence formed the basis of relationship among the political machineries of the state. Importantly, in this type of political environment, the President must ensure that the key political appointments are allocated to his loyalists, ethnic cronies, and kinsmen so that the manipulation of state resources to maintain political power could be assured. To achieve this, the former President Goodluck Jonathan like other past Nigerian political leaders ethicized the key leadership position in the military, "the strategic posts of Chief of Army Staff (COAS) and National Security Advisor (NSA) were occupied by faces from areas which strongly support Jonathan. The appointment of Azubuike Ihejirika represents a major boost for the Igbo south-east and represents the region's first top command appointment since the Biafra war. Similarly, the National Security Advisor (NSA), late General Andrew Azazi is from Jonathan's home state of Bayelsa" (Kaplan 2018). It should be recalled that following the death of late General Andrew Azazi, Col. Sambo Dansuki was appointed to fill the vacuum. Therefore, the kinship and patronage politics continue to dominate the political atmosphere of every

political regime which in turn fueling the ember of corruption in Nigeria.

Notably, the political administration of Goodluck Jonathan was moribund with the challenge of terrorism led by Boko Haram jihadist group in the northern Nigeria. Essentially, there is a need to recognize the intensity of Boko Haram terrorist group, operating in major cities and villages in the northeastern region of the country. Several efforts were employed in curtailing the persistent activities of the insurgents. Therefore, this necessitates provision of adequate funds to purchase military hardware and logistics. This was championed by the office of National Security Adviser [NSA] to the President, Col. Sambo Dansuki [Rtd]. And, it should be acknowledged here that, the Presidential election was fast approaching in which the former President showcased intension to (re)contest for the second term. Here, it can be observed that two fundamental issues are at stake – the problem of terrorism and the conduct of Presidential election (Vanguard Newspaper, December 9, 2015). Therefore, $2.1 billion was allocated to the office of National Security Adviser [NSA], Col. Sambo Dansuki [Rtd] for the purchase of military hardware in order to combat the activities of Boko Haram in the northern part of the country. Apparently, the fund was meant to purchase arms and ammunitions for Nigerian soldiers battling the insurgency in the restive states in the Northeastern part of the country.

Following the defeat of former President Goodluck Jonathan in 2015 Presidential election, President Muhammadu Buhari who took the mantle of leadership began to interrogate the political condition accompanying with the military procurement funds and general defense expenditure. The issue emerged in November 2015 as the Presidential constituted committee saddled with the responsibility of auditing arms procurement since 2007 came out with its interim report, detailing mismanagement and large-scale fraud in the general activities of the military, accredited to the former National Security Adviser (NSA), Colonel Sambo Dansuki (Rtd), the report argues that out of 513 contracts awarded by the office of NSA, there was no evidence for the delivery of 53, estimated as $2.1 billion, including the purchase of 12 helicopters, Alpha Jets, as well as bombs and ammunition. The report described the procurement as superfluous as at the time the exercise was carried out. The report further established massive fraud and general irregularities in defense procurement, confirming that between September 2009 and May 2015, the air force expended approximately $75 million on maintenance of Mi-24 V/35P helicopters, C-130H aircraft, and Alpha Jets. It was established that about $22 million was allocated for contracts not executed. In their fact findings, the committee acknowledged a new form of corruption in the sector, involving diversion of funds allocated for the maintenance, renovation of barracks, and soldiers' allowance by the commanding officers. Moreover, there were allegations that some military and naval officers collaborated with the criminal syndicates in the Niger Delta in carrying out illegal bunkering, oil theft, and illegal oil refining operation.

The nature of governance instituted on the principle of reciprocity that exist between patrons and clients was observed in 2015 arms procurement scandal, often referred as DasukiGate, which interrogates the patronage politics at the expense of the larger population. The Dansukigate is one of the most comprehensive and pejorative allegations in defense sector. In furtherance of the findings, The EFCC began to investigate the pipeline through which the funds were distributed which was later discovered to be facilitated through the financial institutions where some of the looted funds were transferred to the accounts of political big men and allies across the differing ethnic groups within the country. The allotted funds were shared among the few political big men, allies, and associates with the aim of employing the funds to secure the support of political stakeholders within the People's Democratic Party [PDP] for the 2015 Presidential election so that political continuity could be guaranteed. This event led to the arrest of former National Security Adviser [NSA], Col. Sambo Dansuki [Rtd] by the Economic and Financial Crimes Commission. [EFCC]. He was grasped by the Economic and Financial Crimes Commission [EFCC] to answer some vital questions on

the $2.1 billion arms deal scandal, no one knew that the names of high-profile politicians and military generals were allegedly linked to this national embarrassment, who are in-turn enemies within the Nigerian state.

It became obvious that since the confession and trial of the former NSA started, several top-notch politicians who have been allegedly accused of being involved in the $2.1 billion arms deal scandal have been revealed. This is a strong indication that there is a political undertuning tendency in the procurement of arms and ammunitions in the fight against insurgency. An indictment was, however, placed on the then President Goodluck Jonathan by the Socio-Economic Rights and Accountability Project (SERAP) for diversion of arms funds. However, several political juggernauts within the Peoples' Democratic Party [PDP] who have been accomplices in the arms scandal were offered plea bargaining which is considered "as an agreement offer by a prosecutor which provides opportunity for the accused person to plead guilty, often employed as an incentive and requirement for lesser punishment amidst multiple charges leveled against the accused" (Ojo 2019, p. 11). The established legal provision can be found in Section 14(2) of EFCC Act. "The concept has been applied in many high-profile corruption cases where the accused persons are given opportunity to plead guilty after they have agreed to forfeit some of the assets acquired through fraudulent means especially the one possessed through diversion or embezzlement of state resources" (Ojo 2019, p. 12). It is quite absurd that a well-meaning security mission would just be diverted by some supposedly respected senior citizens of the country, without considering the consequential effects of the diversion of purpose. This cannot be inscribed with anything remarkable; rather it was a national embarrassment among the comity of nations. Several revelations have reported that these big men squirrelled the large sums of looted funds in major foreign banks and also used to buy properties in major cities across Europe, America, and Asia, while the killing of defenseless innocent citizens continued across the north-eastern part of Nigeria.

One fundamental issue observed across Africa is that "the big men have monopolized all the political offices, and the youths who they allow to occupy public office are their children and puppets who are being groomed to take over the legacies of the political big men, thereby entrenching a form of circulation of elites" (Nwogwugwu 2018, p. 113). The close political allies of the big men are appointed as senior special advisers, senior special assistants, special assistants, special advisers, and aides without meaningful portfolios. They are often used to facilitate the smuggling of the looted funds out of the country to various foreign banks. The rest of the recruited youth are assigned with dangerous responsibilities. They are usually recruited as political thugs, assassins, election riggers, or as an instrument of intimidation against political enemies and all sorts of occupations that will sustain political legitimacy and hegemonic tendency of the big men, thus, they perpetuate themselves in power and recycle their godsons who are not qualified through the existing predatory political master-plan. Hence, promoting culture of mediocrity and "a system of relations linking rulers not with the 'public' or even with the ruled (at least not directly), but with patrons, associates, clients, supporters, and rivals, who constitute the system" (Jackson and Rosberg 1982, p. 19). Table 1 below reveals the names of political office holders, allies, and military personnel involved in diversion of arms procurement funds under Goodluck Jonathan's regime.

## Defense Institution, Arms Procurement, and Corruption Vulnerability

There are three broad sources of corruption in defense sector as explained in Table 2, including defense institutions (ministries and the armed forces), defense officials (ministerial and military staff), political contexts, and controls. There are several ways through which corrupt conspiracies are executed in defense sector. The most common form is bribery, in which payment of bribes are solicited. The payment usually enacted in form of electronic transfers or cash, it should be

**Boko Haram Insurgency and Defense Corruption, Table 1** Names of political and military officers alleged of sharing arms procurement funds

| No | Names of the Looters | Position held | Amount |
|---|---|---|---|
| 1 | Col. Sambo Dasuki (rtd) | A former National Security Adviser (NSA) | $2.1 billion |
| 2 | Air Chief Marshal Alex Badeh (rtd) | Former Chief of Defense Staff | $930,500,690.00 |
| 3 | Attahiru Bafarawa | Former Sokoto State Governor | N4.6 billion |
| 4 | Diezani Alison-Madueke | Former Minister of Petroleum Resources | $115million |
| 5 | Bashir Yuguda | Former Minister of State for Finance | N1.275billion and N775million |
| 6 | Chief Raymond Dokpesi | Chairman emeritus of Daar communications Plc | N2.1billion |
| 7 | Alhaji Aminu Babakusa | Former General Executive Director at the Nigerian National Petroleum Corporation (NNPC) | N2.2billion |
| 8 | Waripamowei Dudafa | Former Special Assistant to President Goodluck Jonathan on Domestic Matters | N10billion |
| 9 | Femi Fani-Kayode | Director of Publicity of the President Goodluck Jonathan campaign, | N840million |
| 10 | Chief Olu Falae | | N100million |
| 11 | Rashidi Ladoja | | N100million |
| 12 | Prof. Rufai alkali | Coordinator of the Goodluck Support Group (GSG) | N320million |
| 13 | | | |
| 14 | Patrick Ziadeke Akpobolokemi | Former Director-General of the Nigeria Maritime Administration and Safety Agency (NIMASA) | N2.6 billion |
| 15 | Bala James Ngillari | Past governor of Adamawa State | N450 million |
| 16 | Mrs. Esther Nenadi Usma | Former Minister of State Finance and Director of Finance of the Goodluck Jonathan Campaign Organization | N2.5billion |
| 17 | Emeka Mba | Former Director-General of the Nigerian Broadcasting Commission (NBC) | N17 billion |
| 18 | Chief Olisa Metuh | Former National Publicity Secretary of the PDP | N1.4billion |

recognized, here, that it is unusual for defense contractors to make the payment directly to the public officials. Rather, these payments are made through third party – an agent or broker – so as to create gap between the contractors and the corrupt public officials. Thus, limiting the investigative capacity of local and international anticorruption institutions.

In an environment where defense procurement strategies are not based on clear objectives, misuse of security budget is inevitable, and as such, benefiting terrorist organization as well as facilitating general insecurity. Although, the secrecy and little oversight makes the sector a treacherous haven for corruption. It has been argued that defense procurement requires sensitivity and secrecy, as the research survey conducted by Omitoogun and Hutchful (2006) regarding defense procurement mechanisms employed in eight African states which include Kenya, Sierra Leone, Mali, Mozambique, Ethiopia, Ghana, Nigeria, and South Africa validates that there was no transparency, comprehensive analysis, and clarity in the military budgets with the exception of South Africa. As a result, this creates lacuna that is being employed by political profiteers to promote personal accumulation. For this reason, it becomes difficult for the general public to have a blatant information regarding the defense budget due to secrecy and confidentiality

**Boko Haram Insurgency and Defense Corruption, Table 2** Sources of corruption in defense establishment

| Defense officials (ministerial and military staff) | Defense institutions (ministries and armed forces) | Political context and control |
|---|---|---|
| Failure to observe agreed standards of business conduct.<br>Bribery of public officials to bend rules (e.g., avoiding army service; getting preferred postings; "typical" small scale bribery).<br>Money to pass security and other checkpoints | Profiteering from procurement (e.g., steering business to one's self and cronies; breaking rules of competitive bidding; taking kickbacks and bribes).<br>Profiteering from soldiers' payroll (e.g., extracting percentages from total cash; ghost soldiers; adding cronies on secret payrolls).<br>Income from state-owned assets (e.g., below-price sales of property portfolios; selling of surplus equipment; below price privatizations).<br>Self-serving use of budgets and resources (e.g., paying consulting fees to one's self and cronies; appropriating or leasing cars, apartments, equipment, and other goods for personal gain).<br>Receiving benefits from private defense companies<br>Misuse of reward, promotion, and disciplinary processes (e.g., nepotism, clientelism and favoritism; extorting favors from subordinates; sabotaging personnel/other reforms for own advantage). | Non-agreed defense policy.<br>Under-estimated or off-budget defense spending.<br>Dishonest leadership and secret power networks.<br>Involvement in elections and politics and misuse of power to influence legislation and parliamentary investigations.<br>Corrupt judicial processes.<br>Organized crime links.<br>Control of intelligence and misuse of related powers.<br>State capture and the de facto, illicit takeover of defense |

associated with arms procurement. Thus, the political class hides under this clandestine requirement to perpetrate corruption by employing state resources which are distributed among the patrons, big men, clients, loyalists, and political allies to influence, mobilize, and buy the votes of the electorates in order to maintain political control at the national and subnational levels.

Allegation of corruption in defense sector is not surprising. It has been observed that inadequate competition in defense procurement provides a fertile ground for informal contracts, rent-seeking, and corruption; consequently, burdening the nation's economy. Two perspectives that should be considered in understanding defense corruption is the complexity and secretive nature of military procurement as well as bureaucratic sophistication which accommodates corruption tendencies within the security sector. For instance, "it will be recalled that the arms procurement audit revealed that Mr. Dasuki, and the other defense chiefs, purchased unserviceable and cheaper military equipment when they had budgeted for newer military hardware. They then diverted the leftover funds to their personal accounts" (Sahara Reporter January 17, 2016). Many of the contracts carried out in this sector were characterized with breach of extant procurement regulation and lack of due process. The implication of this clandestine makeup in defense contract that prohibiting freedom of information legislation and effective monitoring creates an environment for corruption in the military. The monopolistic market environment also raises a mammoth challenge for arms procurement within the security sector.

The problem associated with single-source procurement contracts moribund the fundamental principles of transparency, value for money, and accommodates vulnerable landscape for

corruption risk. In most countries, the existing public procurement law proscribes single-source contract with an exclusion of emergency period such as in time of war or an urgent period to deal with security challenge like terrorism, conflict, or secessionist movement. In this time, there is possibility to bypass procedural condition as it has to do with emergency that may jeopardize national security. The manifestation of this type of corruption marked the political regime of President Goodluck Jonathan in Nigeria. Uganda also serves as another typical example. Following the 1986 efforts geared towards acquiring military hardware through third parties, a number of agreements were entered into for the procurement of aircraft, guns, and military uniforms. These deals were tainted with bribe, kick-back, excessive payment, and sort of corruption profited by the top military officers, business associates, middlemen, and government officials. It was observed that whenever there is a need to combat insurgency or during war time, the top military officers often profited financially from the operation. Senior military commanders in the country have had a history of corruption, the case of Major-General Salim Saleh who was alleged of awarded $400,000 to his own company while other military officers also pursed their selfish profiteering operation much more than combating the warfare. The datasets on defense expenditures published by Stockholm International Peace Research Institute (SIPRI) also reveals how the principle of transparency and accountability in military spending becomes poor, unreliable, and even implausible from international standard in Sub-Sahara Africa (Willett 2009). Unarguably, since Nigeria returned to democratic regime in 1999, the legislative arm has been assigned with basic oversight function over the issue of national security budget. However, Presidency rather than legislative assembly has been exclusively controlling the defense institution which facilitated its vulnerability to corruption. The national security has been an instrument for regime security rather than a veritable weapon to promote human security of the larger population. In this regard, "the ruling political elites replicated the instrumental approach of their colonial predecessors to state power and security forces continued to serve the interests of the ruling elites rather than the security requirement of the people" (Bendix and Stanley 2008, p. 12).

Corruption in defense sector becomes difficult to get rid of due to complexity and alliance formation embedded in the institution. At the National Assembly, legislators who are assigned with oversight function usually demand their share before the passage of defense budget. Defense budgets are often padded by the parliamentary committee once their share has been taken care of. Considerable interest therefore attaches to the question of whether the budget should be approved. Moreover, in a situation where the majority of legislative memberships are derived from the ruling party, it becomes difficult to default from the wishes of the Presidency due to absolute loyalty and allegiance placed on individual party member. In this context, the issue of parliamentary oversight becomes ineffective, meaningless, and ineffectual to establish accountable security governance. Consequently, establishing accountable, transparent, and inclusive defense institution becomes a difficult task especially in emerging democracies such as Nigeria where patronage politics impounds the basic foundation of democratic institution.

## The Nexus Between Corruption and Insecurity

When corruption abounds in defense sector, terrorism, human security, and organized crime thrive, resulting in ineffective security forces. Evidence from a fragile environment like Afghanistan revealed that the principal motivation for the recruitment of Taliban was the abuse of power by the government. Similar evidence from Nigeria also shows that corruption, bad governance, human right abuse, and institutional failure are responsible for the Boko Haram uprising in the country. An empirical study explained how political corruption can fuel political instability, political terror, violent demonstration, organized

crime, and access to small arms and light weapons which in turn triggers the level of criminality. By misallocating state resources, corruption deteriorates the capacity of the state to provide adequate security. This may directly incapacitate the security personnel to provide adequate security for the general population. For instance, if security personnel remain unpaid or their equipment is obsolete because procurement funds are embezzled, their capability and motivation to defend the state is likely to be degenerated. A typical case in Tunisia where light weapons are being smuggled and transferred through its borders to Afghanistan, facilitated by the government forces, established the effects of corruption on security of a nation. This is rightly observed by transparency international that

> Corruption within the defense and security sector degrades any nation's ability to provide security. It can mean soldiers operating with equipment that doesn't work, or with no equipment at all – such as in Ukraine, where it has been cheaper for a citizen to bribe his way out of military service than to buy the equipment that the Ministry of Defense fails to provide its soldiers with; or it can destroy morale – such as in Nigeria, where soldiers have deserted in unprecedented numbers as a result of the theft of the basic supplies and resources they need to fight; or in the worst cases, whole armies can fall apart – such as in Iraq, where a decade of effort and billions of pounds has delivered poorly coordinated institutions where accountability is so low that an estimated 50,000 ghost soldiers are on their payrolls. (Transparency International 2014)

In too many places, the connection between corruption and insecurity is gaining momentum. In Kenya, bribery also paved way for terrorist attack in Westgate mall. In Iraq, the ISIS disintegrates army as a result of corruption that embedded in Iraqi's military institution. Nigerian annual military budget is estimated between five and six billion dollars, despite the huge funds allocated to security institution, defense sector is plagued with diversion of arms procurement funds for personal use, constraining the soldiers to fight the terrorist group with RPGs which rendered them incompetence in the fight against terrorism. In the north east region of Nigeria, where Boko Haram operates, it has been proclaimed that soldiers budgeted allowances are shaved off by commanders and senior army officers, leaving less than 50% for the soldiers. The failure of the military to curtail the insurgency is attributed to corruption. There are other corruption cases surrounding security votes which bequeath political class to appropriate millions of dollars to personal coffers. Many of the contracts allocated for procuring military hardware are marred by lack of due process, breach of extant procurement regulations, and tainted corrupt practices.

The activities of Boko Haram continued to strive despite the complaints raised my Nigerian military that were ill-equipped, thus endangered the lives of Nigerian soldiers on the altar of corruption by diverting and sharing public resources among the political loyalists and military stakeholders. In this kind of environment, "lives are lost, people displaced, trade links cut, and organized crime groups or terrorists are given an opportunity to take root, exacerbating instability" (Government of the United Kingdom 2011).

Recently, some junior army officers were prosecuted at the martial court as a result of withdrawal from fighting Boko Haram extremists due to shortage of effective ammunition to combat the insurgency. Since the emergence of Boko Haram terrorist group and unceasing bombing, security experts are wondering why the activities of Boko Haram could not be tamed despite Nigerian army is known as one of the best in the world. There is a strong connection between corruption and insecurity. "When a country's institutions are weak, its security forces are not trusted and its borders are not strong, as is the case in Nigeria, giving terrorist organizations room to flourish" (Transparency International 2014). "Pay and equipment shortages have led to large-scale defections and the sale of goods and equipment to Boko Haram fighters" (Transparency International 2015).

There are evidences that Nigerian army allegedly collected bribe from Boko Haram to carry out major operation in the north east, and they have occasionally collided with the terrorists to

promote their lethal operation in the region. The elongation of insurgencies in the northern Nigeria is facilitated mainly to maintain direct private gain from the 20% allocated funds to fight terrorism in the national budget. The corruption lacuna embedded in the military institution therefore exploited by the Boko Haram Islamic group to perpetuate their daily killings. However, the frontline troops suffer the byproduct of corruption. They are under-equipped while many have been ambushed and killed in the battlefield due to superior weapons acquired by the terror group. The case of 66 combatant soldiers who fled during confrontation with the insurgent group established this fact. Also, there are cases of ghost security personnel who only exist on paper, the senior military officers employed ghost payment arrangement as a leeway to siphon public funds. Thus, the high level of corruption in Nigerian military institution provides an alternative approach for Boko Haram to bribe the military officers in order to carry out their major deadly operation in the northern Nigeria. Transparency international further elaborates how corruption has advanced the level of insecurity in the country, it argued that, "If you've got an ill-disciplined security sector that is abusing its own power, whether it's because its soldiers are not being paid or because there's just [a] sort of a culture of impunity, then, of course, you are driving people to join groups like Boko Haram, who offer a very simplistic alternative to what is considered to be a corrupt establishment" (quoted in Solomon 2017). The 2016 Government Anti-Corruption Index published by Transparency International indicates mammoth flaws and irregularities in the defense sector, placing Nigeria as the most vulnerable country when it comes to defense corruption (Transparency International 2016). It is in line with the above views that it was observed that:

> Thousands of needless Nigerian deaths would have been avoided if the money had been properly spent. (Telegraph 18 Nov 2015)

The case of Nigeria exemplified how corruption in defense sector promotes terrorism in the northern part of the country, resulting in utilization of obsolete weapons by the army and other security forces, making the fight against the violent extremism more difficult to win by the security forces. Thousands of villages, communities, and cities have been destroyed by the Boko Haram as a result of diversion and mismanagement of funds. It can now be argued that the effects of corruption on the general security of lives and properties are enormous; it impinges on the effective performance of the security forces and its institution. It is observed that the major reason why Boko Haram has not been defeated is centered on corruption instituted in the military. This takes many dimensions, including diversion of security funds by the top military and political office holders for personal use, bribery, and tactical elongation of Boko Haram revolt by the political and top military officers so that those in government will continue to allocate more funds for the curtailment of insurgency.

## Conclusion

There are damn consequences in patrimonial state where access to power is leverage on access to state resources. The persistent application of patronage system to sustain political leadership has been one of the devices used to garner political support in the country. The case of Dansukigate revealed how defense sector was employed by the political leadership of former President Goodluck Jonathan in diverting public resources allocated for the fight against Boko Haram jihadists. Jonathan's political regime became a prey to regional political patrons and big men who served as the key determinants in advancing and sustaining his second-term bid, and this systemic political operation explains the governance system in Africa. The support of political big men becomes necessary and, therefore, required negotiation and distribution of state resources as a precondition for (re)election under the aegis of People Democratic Party [PDP]. Over the last 10 years, corrupt elites have profited from

the conflict in the northeast and driven Nigeria to a crisis point. It is not that Nigeria has no military competence to subdue Boko Haram insurgency in the north east, corruption is exacerbating the level of insecurity, and it's considered as a big driver that prolong Boko Haram insurgency. "Reports from soldiers and officers on the field indicated that Boko Haram could be wiped out easily but for colluding military commanders who want the campaign prolonged for selfish commercial benefits" (Daily Post June 4, 2018), while Nigerians continued to wonder why the war persisted for so long, and how the rag-tag Boko Haram could occupy the northeast despite the fact that Nigeria's armed forces are known as one of the best in the world. In spite of the huge funds allocated annually to defense sector, the military is underequipped, the solders are not well trained, and they are underpaid due to corruption that ravaged the institution. Although, confidentiality is inevitable in national security, however, this does not absolutely guarantee noncompliance with the national and international democratic accountability operates in civilized societies. Several evidences revealed that the funds allocated for arms procurement during President Goodluck Jonathan's regime were shared among the political office holders and the senior military personnel in the country, thus, thwarting and subjugating the war against terrorism, and depicting the corrupt political and military officers as the enemies within the Nigerian state. From the context of public policy and budgetary administration, the military sector has similar features like other public sector in which the issue of accountability, transparency, and procedural compliance are considered sacrosanct, it is therefore essential to prioritize openness in budgetary matters and military spending, subjecting to the parliamentary approval, political and administrative authorities within the Nigerian public sector. The national defense policy needs to be thoroughly debated in the parliament, while the ministry of defense needs to inform the parliament on the periodic military spending in a comprehensive manner, detailing secret spending and overall defense spending. In tandem with the scrutinization by the parliament, the defense procurement activities should be in conformity with the public procurement policy which allows the defense committee, Auditor General of Federation, Accountant-General to carry out their responsibility with the help of external auditing verification in order to build public confidence in overall military expenditure in Nigeria.

# Border Governance and Shoot-to-Kill Policy

Saleh Shahriar
Department of History and Philosophy, School of Humanities and Social Sciences, North South University, Dhaka, Bangladesh

## Synonyms

Border deaths; Border killings; Border management; Border violence

## Definition

Border governance is a multifaceted concept. There is no clear-cut unanimity as to its meaning. Border governance facilitates social and economic development and contributes to an environment where human rights are respected. The issue of accountability is the central dimension in cross-border governance. Promotion and respect for human rights is crucial for border governance. A shoot-to-kill policy is a border reinforcement strategy. It is a systematic shooting practices employed by border guards against unauthorized border crossers as an official state policy. The shoot-to-kill strategy is an impediment to border governance.

## Introduction

The existence of borders and borderlands is a global reality. The rise of governance in border studies has become an opportunity to increase efficiency, generate better institutional arrangements, and reduce the gap between theory and practice (Wong Villanueva et al. 2021). Borders are an integral part of the modern nation-states. They facilitate interstate cooperation, bilateral trade, and regional tranquility. International borders are one of the central institutions defining states and organizing international politics. There are more types of border today than ever before in history (Nail 2016). In turn, border crossings and deaths have become a global phenomenon. The violation of human rights at the border is a matter of global concern. Individual borders have their own specific histories, and the policies designed to defend them are shaped by local as well as global factors (Weber and Pickering 2011). Therefore, border management is a highly complex system (Ulusoy et al. 2019).

The *Deaths at the Borders Database* is the first longitudinal and geographically comprehensive collection of official evidence about deceased irregular border crossers in EU Member States. The database found that more than 3000 people died while they were trying to cross the borders of Europe between 1990 and 2013 (Last et al. 2017). More than 1000 deaths are also documented along the US-Mexico border and deaths from hyperthermia, hypothermia, and dehydration increased sharply from 1993 to 1997 as intensified border enforcement redirected undocumented migration flows from urban crossing points to more remote crossing areas where the migrants are exposed to a greater risk of death (Eschbach et al. 1999).

In South Asia, most of the borders were demarcated by the then British colonial government to overcome their security anxieties and governance crises. These borders are the results of war,

conflicts, violence, and victories while sometimes they were drawn as an outcome of diplomatic efforts and politico-administrative conveniences. Bangladesh and India share 4,096 km of land borders. Since the beginnings of 2000s, India adopted a shoot-to-kill policy on the borderland of Bangladesh. However, there is a dearth of knowledge on India's shoot-to-kill policy employed on the border of Bangladesh. Indeed, states that have poor human rights records might feel less restrained in killing unauthorized border crossers (Oztig 2018). Against this backdrop, the current chapter aims to explore the dynamics of border governance in relations to the shoot-to-kill policy of India. It argues that India's shoot-to-kill policy is antithetical to cross-border governance. Note that India has assured Bangladesh of using non-lethal of weapon at the border to bring down border killing zero.

## Border Studies: Conceptual and Theoretical Perspectives

A border is conceptualized as a set of institutions, contextual power dynamics, social discourses, everyday practices, population movements, and cross-border trade flows (Shahriar 2020). Currently, there is an absence of a single explanatory model or theoretical framework to study the cutting-edge issues of borderlands. Therefore, theorizing borders and the dynamics of bordering, ordering, and re-bordering have become key components of understanding contemporary social and political change (Kolossov 2012; Paasi 2020; Rumford 2006). The modern concept of borders and boundaries emerged with the Westphalia Treaty of 1648 which marked the beginning of the era of the nation-state. Several words, namely "frontier," "boundary," "border," and "borderland" are technically different although often used interchangeably (Banerjee 2010; Bhardwaj 2016). From the very beginning of the nation-state, border has been the main priority for governments, and this has also been reflected in the security policy research. Since the end of the Cold War, the numbers of borderlands have increased and consequently, there is an urgent need for border studies (Paasi 2012).

The study of borderlands has become interdisciplinary and border studies have also become global over the past few decades. In fact, the study of borders has undergone a renaissance during the past decades (Newman 2006, 2011). There are a number of paradigms to study borders and borderlands. The paradigms include territoriality, borders in globalization, bordering practice, and borderscapes. Border studies is a relatively young field where paradigm competition is present and alive. Border studies are at a crossroad of moving away from the territorial notion of space developed by the Westphalian system, but without an agreement or a solid paradigm to understand the emerging specialization of borders (Ferdoush 2018, 2020; Peña 2021). Agnew (2019) observes a contemporary political crisis about borders due to the problems of current demographic changes, mass migration flows, and global climate changes. Newman (2003) argues that power relations are of great importance to understand the dynamics of borders and bordering. Another border scholar argues that four key variables – market forces, multiple and integrated government action, culture, and popular control – must be considered to understand borders (Brunet-Jailly 2004, 2005). The construction of physical barriers along borders, such as walls and fences, is a matter of debate in international relations. Walls have been a hot topic, especially since the former US President Donald Trump promised to build a wall along the US-Mexico border – and to make Mexico pay for it. His agenda to build a "big" and "beautiful" border wall raised alarms for anyone concerned with social justice and environmental well-being throughout the Mexico-US borderlands (Aras 2020; Meierotto 2020; Ochoa Espejo 2020; Wright 2019). In this era of globalization, an emerging trend at borders globally, and in Asia specifically, is the militarization of border spaces. The militarization of borders has meant surveillance technologies, drones, and high-tech sensors, as well as military weapons including tanks, armored personnel carriers, and battle weapons are increasingly used to monitor the civilian

movements in borders. As a result, borders have become increasingly militarized, hardened, securitized, and violent (Jones 2018).

## Border Governance and Shoot-to-Kill Policies

### Policy Analysis

The notions of "governance" and "good governance" are issues of huge debate. These concepts provide opportunities as well as constraints or challenges in the literature (Farazmand 2017). Border governance "involves various institutions, technologies, laws and practices to secure and control the state's borders with the primary goal of suppressing clandestine migration and 'illegal' border crossings" (Mengiste 2021, p. 7). The dataset made by Oztig et al. (2020), has several border security strategies of 58 countries. Of them, in 38 cases, states reinforced their borders through wall/barrier building, militarization, joint patrolling, etc. In the remaining 20 cases, states adopted shoot-to-kill policies.

Cross-border governance takes many different, more or less structured forms including cooperation protocols, conventions, agreements, meetings, and memorandum of understandings. The violation of human rights is a major concern at the Bangladesh-India borderlands. The shoot-to-kill policy is a tool for human rights violations. Bangladesh-India border is, therefore, recognized as a "killer border" (Schendel 2005) as well as the "deadliest" border in the world (Percot 2020). Table 1 shows that a total of 1238 Bangladeshi citizens were killed at the Bangladesh-India border during 2000 to March, 2021. It is argued that a section of India's Border Security Force (BSF) is

**Border Governance and Shoot-to-Kill Policy, Table 1** Human rights violation by Indian Border Security Force (BSF) against Bangladeshi Citizens: 2000–2021

the main violator of human rights at the borderlands between the two countries. India has assured Bangladesh of using non-lethal of weapon at the border to bring down border killing zero. That assurance is yet to be materialized.

Jones (2016) identifies five forms of border violence: violent practices of border guards; border reinforcements (such as walls) that direct unauthorized border crossers to cross borders through unsafe areas; states' threat of punishment for the absence of proper documents at borders; and the disruptive impacts of borders on the economic well-being of people and the environment. In conflict situations, the enactment of the border is often associated with violence (Yoni 2020).

### Illustrative Case Study

The case study method relies heavily on a great variety of evidence, including in-depth interviews, surveys, direct observation, secondary accounts, books, and so forth (Gerring 2017). The method is preferred in the examination of contemporary events. The case study approach provides an in-depth analysis of a single unit or a real-life problem (Yin 2014). Felani Khatun, a 15-year-old Bangladeshi girl, was shot and killed by India's Border Security Force (BSF) on 7 January 2011, at the Bangladesh-India border. Her life is an illustration of shooting practices at the Bangladesh-India borderlands. Like many adolescents in south Asia, she had dropped out of school and would marry early. Ten years have already passed since adolescent Felani was killed. On January 7, 2011, members of the Indian BSF shot dead Felani Khatun, as she was crossing the Bangladesh-India border into Bangladesh. Her body was left hanging from the barbed wire fence of the border (Fig. 1). On August 19, 2013, the special court constituted by the BSF had acquitted Amiya Ghosh from the charge. On September 22, the case was reopened due to huge criticism by the media and NGO. BSF member Amiya Ghosh, who was involved in the killing, and his superior officers has not been convicted.

The hanging of Felani's body came to exemplify Bangladesh's geo-body and its unequal relationship with India (Sur 2021). By the end of 2020, India had completed almost 3,120 kilometers of fencing to prevent illegal migration from Bangladesh and aims to finish the rest of it soon.

## Causes and Consequences

The impact of India's shoot-to-kill policy on the bilateral relationship between Bangladesh and India has been documented elsewhere. For instance, Shahriar et al. (2020) observe that the continued culture of border killings hampers the bilateral relationships between India and Bangladesh by creating a climate of fear and

**Border Governance and Shoot-to-Kill Policy, Fig. 1** Felani's body hanging from the fence of the Bangladesh-India border. (Source: Odhikar 2018)

mutual mistrust. Further, the border areas between the two countries are densely populated and socio-economically backward. Many people on both sides have lost farms and livelihood due to floods and riverbank erosions (Shahriar 2021b) and are dependent on cross-border activities, such as cattle trade and smuggling of illegal arms, drugs, electronic goods, oil, dried fishes, cosmetic products, bicycle, rice, onions, goats, medicine, fabrics, seeds, fertilizers, coals, gold, coins, stones, and other commodities. Smuggling is an important economic activity all along the Bangladesh-India border (Ghosh 2019; Van Schendel 1993). There is no reliable statistics on the flows of smuggled items at the borderlands. According to an estimate, the total volume of smuggled goods from India to Bangladesh is valued to be as high as $900 million or three times the volume of legal trade (Sur 2013).

The Bangladesh-India border governance is thus related to the issues of smuggling, migration, drug trafficking, and trans-border crimes. It is expected that Land Boundary Agreement (LBA) implementation will bring about positive outcomes through effective border management, counter-terrorism cooperation, and prevent smuggling and other border-centric crimes (Islam 2021). Nevertheless, Bangladesh and India share a bilateral trade of US $6 billion, more than 90% of which is Indian exports to Bangladesh. There is an increasing deficit in Bangladesh-India trade. It is crucial to reduce the trade deficit to curb illegal flows of goods along the border.

## Implications and Future Research

A key challenge in maintaining sound border governance is to produce reliable data on border deaths or killings. It is important to investigate whether – and if so: why? – there is any significant correlation between the occurrence of border deaths and killings on the one hand, and changes in national, regional, or international immigration and border control policies on the other (Gombeer et al. 2020). The trust deficit and lack of political will among the neighboring countries of the Asian region due to a number of cross-border issues, particularly political and security issues, i.e., presence of cross-border insurgency and criminal activities, border crossing of illegal migrants, as well as drug and arms trafficking in border region, often affect the trade promotion, greater mobility of people, and institutional collaboration and exchanges across international borders (Gogoi 2020). It would be a timely study how borderlands shooting practices are perceived and experienced by individuals in both border and nonborder areas of the two countries – Bangladesh and India. Moreover, the global dataset on shoot-to-kill policies and more in-depth case studies on border killings merit future scholarly attention. Devising an acceptable as well as implementable strategy to stop India's shooting practices on Bangladesh's borderlands is an area of urgent attention (Shahriar 2021a).

Border *haats* are local markets or bazaars that operate on border regions and attract clientele and sellers from both sides. Cross-border tourism and cooperation is getting momentum around the world (Kozak and Buhalis 2019). The introduction of the border *haats* is an important step toward the development of cross-border relations between Bangladesh and India. Border *haats* are informal market places organized by the two countries one day each week. The governments of the two countries – Bangladesh and India – had initiated the idea of border *haats* along the Indo-Bangladesh border with the objective of helping people living in border areas to market their local produce and also as a confidence-building measure among the citizens of the two countries (CUTS International 2019). China has proposed to build up the Bangladesh-China-India-Myanmar (BCIM) economic corridor under the Belt and Road Initiative (Gabusi 2020; Rippa 2020). The markets/haats/bazaar economy might take place through a network of contacts, prices, sellers, and buyers. The governments of Bangladesh, China, India, and Myanmar could develop a plethora of industrial and educational development projects along the borderlands. The projects could address several issues, including poverty alleviation, income-generating activities

(IGA) promotion, livelihoods development, employments generation, and tourism growth. This will, in turn, contribute to the reduction of cross-border insurgent movements and terrorism as well as support peace in cross-border regions.

India constructed a controversial barbed fencing of 3,120 kilometers out of more than 4,000 km long India-Bangladesh borderlands. If one can do fieldwork in a selected India-Bangladesh location to find out what the outcome of the fence has been in terms of border crossings, effect on employment, poverty or household income, and cross-border informal trade, then it will certainly be very interesting research. Another interesting topic can be on the value of remittances produced by informal migrants and informal cross-border trade. There is enormous interest in the kind of resources generated by migrants, even very poor ones, if one can somehow quantify the cross-border trade and money sent by the migrants to Bangladesh. Further research is, thus, needed to explore the socioeconomic, cultural, and political dynamics of the Bangladesh-India border wall making.

## Conclusion

This chapter has explored India's shoot-to-kill policy adopted on the Bangladesh border. As a young field of study, border research has gone through quite a few evolutionary changes and processes. The impact of India's shoot-to-kill policy is evident on the complex bilateral relations between Bangladesh and India. The act of smugglings, illegal drug trade, insurgencies, and border crossing pose threat to border governance. The knowledge about these factors could help policymakers to take decisions with the aim at peace and stability at the Bangladesh-India borderlands. Indian leaders have, however, repeatedly assured the government of Bangladesh that it would stop its current shooting practices on the Bangladesh border. The commitments made by the Indian leaders and policy elites should be translated into reality for ensuring cross-border peace and governance. The civil society organizations, rights activists, and scholars from both Bangladesh and India would need to raise their voices against India's shoot-to-kill policy to uphold the spirits of cross-border governance.

# Bottom-Up Anti-corruption Approach

Nurul Huda Sakib
Department of Government and Politics, Jahangirnagar University, Dhaka, Bangladesh

## Synonyms

Home-grown initiatives of preventing corruption; Localism in anti-corruption; Social accountability

## Defining Bottom-Up Anti-Corruption Approach

The bottom-up approach of anti-corruption can be defined as a process of preventing corruption from the community level through active participation from the citizens while public officials or corrupt syndicate is involved in wrongdoing. The term often is also known as localism, community engagement, spontaneous participation, or home-grown initiatives in preventing corruption. Participatory budgeting in South and North America can be cited as a textbook example of the bottom-up approach of anti-corruption where local people involved in public policymaking to ensure proper use of public money in their locality.

## Early Development of the Bottom-Up Approach of Anti-Corruption

The top-down approach of anti-corruption suggests that preventing corruption or anti-corruption measures taken from the central authority. This is more like a principal-agent relationship where the principal will monitor his agents and punish while caught in wrongdoing (Klitgaard 1988). However, the traditional top-down approach does not have potential success as the principal cannot monitor them due to complex bureaucratic paradox (Berman 1978). Therefore, in top-down approach public officials or assign authority likely to involved in corrupt practice as there is a lack of obligatory accountability measures. Often, they all are involved in an organized syndicate to manipulate the system. Consequently, public officials demand a bribe, delaying service, harass citizens, nepotism, favouritism, and so on. However, in the 1970s and early 1980s, a quite different approach emerged in response to the apparent feebleness of the "top-down" perception. Driven by new public management (NPM), bottom-up approach rather focusing on problem issues avoiding various policy stages like formulation, implantation (Sabatier 1986). The concept further developed by novel laureate Amartya Sen and Elinor Ostrom arguing poor and marginalized people needs bottom-up solution to empower their rights. Ostrom (1990) in her theory of "commons" particularly focused on local solutions for local people by building institutions through collective action at the community level. Similarly, Sen (1999) in his "capabilities framework" suggested empowering people for opulence or utility through social capital at the community level. Further, the successful implementation of bottom-up through community participation from 1978 to 1990 of the Independent Anti-Corruption Commission (ICAC) of Hong Kong added a new dimension in anti-corruption policymaking around the world (Scott and Gong 2015). Their (Sen and Ostrom) scholarship and ICAC evidence shaped the donors to think a new approach of development through community engagement in the development process. As a result, donors were keener to promote citizens

participation through social accountability mechanisms as a development process and bring service at doorsteps. It will bring government closer to citizens and become more accountable to the citizens (Schatz 2013).

## Why Is Bottom-Up Anti-Corruption Critical?

The early development of bottom-up approach suggests that top-down approach fail to meet the citizens demand in public policy delivery. But the approach is become increasingly popular not only the failure of top-down but also driving citizens in public policymaking. According to Rocha Menocal and Sharma (2008), the direct involvement of citizens in policymaking will make public institutions more responsive to citizens' needs and demands. As a result, public officials will be more accountable for their actions and there will be a change in policy, practice, behavior, and power relationship. The consequence of the change has a broader outcome of poverty reduction, human development and achieving the Millennium Development Goals (MDGs) as a whole. Similarly, In the case of the United Kingdom's (UK)'s *Localism Act 2011*, Lawton and Macaulay (2014) suggest that engrossment in local issues make citizens expert and empowered to achieve their rights.

On a similar note, Banerjee and Duflo (2006) have identified three reasons for promoting bottom-up approach at the community level; first; citizens are always in a better position to judge the quality of the service and nature of the public service quality in their locality. Therefore, the local community can assess the situation and take necessary steps to prevent the wrongdoing. Second; citizens have direct involvement with the process as they are the beneficiaries of the service. Therefore, they have stronger incentives to monitor the process. Third; there is the case of social disapproval of public officials if they caught while wrongdoing. Besides, public officials are being monitored by the community might lead them to watchful during their duties.

These outcomes of the bottom-up approach denote a few crucial factors to succeed;

**First**; the approach needs active participation from the citizens. The success of the bottom-up approach to prevent corruption profoundly depends on the active participation of the local people. Active participation not only serves the purpose of the local people but also strengthening the efficiency of citizen action, both individually and collectively. For example, the case of negotiation of garments worker in Bangladesh with the relevant stakeholders for their rights or in the Philippines, the network of peasant organizations and NGOs efforts to drive land reforms and making substantive can cite as the active participation of the community (Gaventa and Barrett 2012). Also, active participation reduces the opportunity for corruption in public service delivery. Therefore, the success and sustainability of the bottom-up approach depend on this.

**Second**; the factor that drives to the success of the bottom-up approach of anti-corruption is the local solution to the local problem. Analyzing problems of best practice or isomorphism Matt Andrews (2013) argues that donor led isomorphic approach often failed to understand the local context and ignores several critical issues during policy implementation. Therefore, these public policy measures failed, and anti-corruption efforts hardly see accomplishment. Alternatively, the bottom-up approach always assesses the problem and drive towards direct solutions. It reduces the intermediaries or channels of corruption. Often uses an informal mechanism to escape local political power during the process.

**Third;** a crucial factor in the bottom-up approach is the sense of ownership and responsibility. The other issues like a sense of social identity, dignity and bonding are also linked with a sense of ownership and responsibility. When the ownership and responsibility are visible among citizens that ultimately drive active participation in the bottom-up approach. For example, community protest Asia Energy at Phulbari in Bangladesh was successful due to a sense of ownership and responsibility among all the community members. The entire community

in Phulbari was united against the corruption of trio-nexus of politics, bureaucracy, and Asia Energy (Karim 2016).

## Models and Implications of Bottom-Up Anti-Corruption Approach Worldwide

Since 1990 the World Bank has made a significant move to promote a bottom-up approach, especially in developing countries to ensure accountability. It also opened new avenues for homegrown solutions to several countries. Countries both developed and developing countries around the world have significant success using the bottom-up approach. At the same several pieces of research have been conducted on the bottom-up approach notably by Matt Andrews, Lant Pritchett, and Michel Woolcock upholding "Problem Driven Iterative Adaptation" (PDIA) model to escape capability traps. Instead of the application of "best practice," PDIA encourages viable and relevant interventions based on specific problems. They argued that developing countries should focus on local context rather than donor-assisted reforms and global isomorphic best practices (Table 1).

Their PDIA model is based on four core principles which entirely ignore the top-down model of project implementation. It starts with performance-based locally nominated solutions of the problems, generates a rational environment for local people in decision-making, frequent feedback loop, and actively engage local people in reforms for viable and legitimate solutions of their problems (Andrews et al. 2013). The underline fact of the PDIA model is it brings a promising result where institutional reforms through the top-down approach have a substandard result (Andrews 2013). A wonderful example of PDIA model success is the case of Uganda, where reform based on local context in the local government and government procurement made the significant process of countries anti-corruption measures (Andrews 2018).

Another notable example of the bottom-up approach of preventing corruption is "participatory budgeting" (PB) which initially begin in Porto Alegre, Brazil in 1989 as an anti-poverty measure. Now spread over 3000 cities in the world the model is now a mechanism of civic engagement controlling public money expenditure in the local school, housing and required institutions. The PB is year wise process starts with designing the process where a steering committee representing from the community creates the rules and engagement plan and decide where to spend public money. In Brazil numerous municipalities now using the model and reduce the opportunity of corruption Studies found that PB also improved the socioeconomic indicators like health services, reducing infant mortality

**Bottom-Up Anti-corruption Approach, Table 1** Contrasting mainstream development project approaches and PDIA (Andrews et al. 2013, p. 240)

| Elements of approach | Mainstream development projects/policies/programs | Problem-driven iterative adaptation |
|---|---|---|
| What drives action? | Externally nominated problems or "solutions" in which deviation from "best practice" is itself defined as the problem | Locally problem-driven – looking to solve particular problems |
| Planning for action | Lots of advance planning, articulating a plan of action, with implementation regarded as following the planned script. | "Muddling through" with the authorization of positive deviance and a purposive crawl of the available design space |
| Feedback loops | Monitoring (short loops, focused on disbursement and process compliance) and Evaluation (long feedback loop on outputs, maybe outcomes) | Tight feedback loops based on the problem and on experimentation with information loops integrated with decisions |
| Plan for scaling up and diffusion of learning | Top-down – the head learns and leads, the rest follow and listen. | Diffusion of feasible practice across organizations, communities of practitioners |

rates (holding per capita budgets constant). Also, it enhanced institutional quality to provide services (Fox 2015).

Apart from these widely popular models, studies on bottom-up approach also found several local initiatives that are making a significant contribution to promoting accountability and uprooting corruption at the local level. For example, in India, there are dozens of examples of a home-grown initiative to prevent corruption. One such initiative is community public oversight hearings at the grassroots level which significantly influence national policy. In Rajasthan, the local politician blocked the state government efforts to implement the law through social auditing (Pande 2014). In a different context, Webb (2012) found that the poor people in Delhi obtained services from public institutions through a collective approach and the use of the *Right to Information Act 2005*. Even Citizen Report Card (CRC) in Bangalore is making an influence in the election as the State government was emphasizing on the CRC results. CRC provides feedback on service delivery which also denotes public attitudes towards government. Therefore, the State government is keen to implement reforms, to strengthen monitoring, and to reduce opportunities for corruption (Schatz 2013).

Similarly, the Indian Ocean nation Mauritius also have some success through the bottom-up approach. The director of Independent Commission Against Corruption made some reforms at the local level and cut the network of graft which significantly reduced the highly visible forms of graft in the country. It also helped to reduce the opportunities for bribe-taking, nepotism, and conflicts of interest in the public service (Dreisbach 2017). Contrasting two town administration in Slovakia, Martin and Sala, Jacko (2012) found that Sala's efforts made a positive impact. At Sala, the local anti-corruption activists used the bottom-up approach of the anti-corruption program including more basic measures and incremental change for governance compared to Martin. Uganda's education spending information campaign is another example of tracking corruption which reduces the opportunity of systematic and high rates of leakage. Information campaign raising parental awareness of block grants for schools sharply reduce the share of funds diverted (Fox 2015). Other bottom-up initiatives like Cooperative Community Groups (CCGs) in Thailand, Residents' Committees in Singapore, Neighbourhood Associations in Japan (Read and Pekkanen 2009), and Civic Organizations in Indonesia (Achwan and Ganie-Rochman 2009) also made a significant change in public service delivery. In another research based on 60 case studies, Goetz and Gaventa (2001) found that citizens' engagement and civil society initiatives have fostered public services, thus having a direct influence on policy and spending decisions. Using evidence from Hong Kong, Scott and Gong (2015) found that a bottom-up approach has a significant impact on public attitudes on corruption and works to prevent corruption.

All the models and case studies from different countries and context showed these initiatives not only encourage local development but also reduce opportunities for corruption by engaging citizens in the process. Consequently, these are making a drastic change in local level through active participation, local solutions, and ownership.

## Criticism and Limitations of Bottom-Up Anti-Corruption

The bottom-up approach of anti-corruption has been criticized from different perspectives and there are many limitations of practical implication of the concept. Evidence suggests that the entire approach is very difficult to implement in the local context. Past literature advocates that bottom-up anti-corruption efforts may likely to fail due to lack of power to enforce. In practice, local realities are far complex than it looks like. Therefore, these theories of change involving citizens at the local level more likely to be donor intervention where development outcome depends on local authorities (Gaventa and Barrett 2012). Local authorities or community-based organizations do not have enough capacity to enforce their power against the ruling class or power elites. As Jenkins

(2007) rightly pointed out accountability often rely on power relationship. Therefore, in the local context citizens often need actors in-between to hold officials accountable. Thinking about the role of intermediary Schatz (2013, p. 163) mentioned that;

> *In such triangular relationships, the media, academic bodies, citizen committees or the like act as 'proxies for the people'. Especially in environments with a large power gap, social accountability mechanisms are both dependent on these 'surrogate participants' and strengthening them alike.*

However, societies with corrupt media and partisan civil society might have a different outcome to promote bottom-up approach. For example, developing countries like Bangladesh where patronage politics is intensively complex these efforts need active participation from the community (Sakib 2019). However, it is many often lacks active participation from the community due to awareness, fair of falling into danger, or death. As the outcome of the bottom-up approach is time-consuming and need direct involvement people on many occasions thinks that these sorts of activities are a waste of time. Fox (2015) arguing that bottom-up collective approach on many occasions lacks information, monitoring often lacks bite due to local elite influence and official approach capture by local elites. Similarly, Verdenicci and Hough (2015) also found that these citizen-centered approach easily lose their direction due to coordination and greatly influenced by elite capture. All these problems of bottom-up approach on many occasions directed towards catastrophe. They either politically used or failed to sustain for a longer time.

## Conclusion

Countries with higher governance index now promoting bottom-up approach under NPM concept. Citizens are also involved in decision making in local governance. However, the context in the developing world is different as these countries had to battle with poverty, inequality, and other socioeconomic issues. Awareness level in those countries is a significant problem as well. Despite having many constrain, developing countries is showing significant promise to battle against corruption through a bottom-up approach. Several cases drawn in this text from many developing countries proved that corruption can be prevented and public service could be improved through localization and homegrown efforts. It not only empowers citizens but also improve integrity and social bonding among the community.

# Boundary Spanning and Public Administration

Christopher L. Atkinson
Public Administration, University of West Florida, Pensacola, FL, USA

## Synonyms

Boundary objects; Boundary work; Complexity leadership

## Definition

Boundary spanning encompasses a range of activities through which individuals seek to connect and engage their home organization with other organizations and structures; in public administration, boundary spanning behavior may be thought of as an asset, as those with this capacity can help organizations achieve objectives, both particular and societal, and to bridge gaps that would otherwise needlessly persist.

## Introduction

The working environment of the public sector is often challenging: public problems have grown ever more complex, and tasks have been divided among agencies in a fragmented government space. There are calls for greater public participation, but these calls are sometimes offset by internal realities of resource allocations and the potential for failed

collaborations. Boundaries, whether internal or external to organizations, increase specialization but also obstruct coordination (Van Meerkerk and Edelenbos 2018).

The role of public service, as a result, relies on an evolving skill set; the abilities to adroitly understand various stakeholders, gauge needs, find common ground, and pursue appropriate activities to extend connections are, by virtue of increasingly complexity and competition for public resources, crucial (Rhodes 2016). Vital networks between stakeholders, organizations, and even the people within institutions are only maintained with work, dedication, and an intuitive sense of there being an optimal way forward where many can share in success.

To this end, boundary spanning, where "people. . .operate at the periphery or boundary of an organization, performing organizational relevant tasks, relating the organization with elements outside it" (Leifer and Delbecq 1978, pp. 40–41), remains a topic of interest and study. Boundary spanning is representative of an adaptive leadership approach, in that its agents bring perspective and diverse viewpoints into discussions, facilitating connections, relationships, and networks that might not otherwise exist (Murphy et al. 2017). Through boundary spanning, communities of practice can be developed to traverse areas of specialization and structural boundaries (Smith 2016). Boundary spanning work is thought to lead to stronger organizations that are more able to withstand shocks; boundary spanners assist in helping competing and even contrary perspectives attain consensus, by understanding commonalities that exist among the parties. Boundary spanning can refer to individuals engaged in these activities, organizations that stand on the periphery between organizations with potentially competing viewpoints (through the individuals engaged in these activities), or the potential for objects to be seen and evaluated differently by various individuals and groups, given some sense of their usefulness across contexts.

## Boundary Spanning in Theory and Practice

While there is general agreement that boundary spanning is relevant and important, harmony on definitions is ephemeral. Work on organizational theory and behavior presupposed a general need to make sense of organizational similarities and differences, so that objectives could be realized. James D. Thompson described boundary spanning as an output role, "designed to arrange for distribution of the organization's ultimate product, service, or impact to other agents of the society...linking organization and environment through interaction between member and nonmember" (Thompson 1962, p. 309). The definitions of the concept now have evolved in numerous ways. Some definitions have focused on the boundary spanner as an individual, working within a system to control the flow of information between parties in a discussion and therefore potentially holding considerable power. Other approaches have focused on the ability of the boundary spanner to relate dissimilar and distinct perspectives in furtherance of common, even societal, goals. Boundary spanning is both a role and an activity. While a boundary spanner is working between organizations, or even to bridge cultural gaps within an institution, the individual must still carry out their primary activities within their home group (Brown 2017). In a sense, the boundary work is entrepreneurial and is value added. Because it is often not well understood, there is sometimes a failure on the part of organizations that benefit from this boundary work to consider maintenance of boundary channels and relationships or succession planning to ensure that boundary work continues (Carey et al. 2017).

Updates to personnel qualifications in government service have tended to include boundary spanning-related language, like "leading change, leading people, and delivering results through the strategic management of resources and building of internal and external coalitions" (Husar Holmes 2012, p. 451). This indicates awareness of complexity and the need of the role of internal agents

that can work within a complex environment to make actionable bonds.

Van Meerkerk and Edelenbos (2018) completed a systematic literature review of boundary spanning as applied to public organizations. Boundary spanning also figures in other recent literature, including a study on senior civil servants in the UK and the nature of their roles (Guarneros-Meza and Martin 2016), a comparative approach to bureaucracy in Ghana where boundary spanning behavior is evident (McDonnell 2017), and "swatting" (calling in false police calls to threaten or endanger another party) and the role of network governance (Wachhaus 2018).

## Conclusion and Opportunities for Future Research

Boundary spanning as a concept is adaptable and adjusts to fit the case in question. In one sense, this makes the term valuable, in that it can be applied to so many potential cases and contexts; from another view, this mutable quality may lead boundary spanning study toward dilution and irrelevance. The test of research in this area is the value that it might bring to the practice of public administration. Of great use is academic work that allows public practitioners to employ knowledge attained through research in real-world scenarios. For boundary spanning, research may allow boundary spanners to better understand the nature of their roles and involvement, as well as the interactions they have with others in their home organizations and with other groups, and engage in useful coping strategies (Agger and Poulsen 2017). It can be difficult to attribute the benefit of boundary spanning to the specific activities of individuals and this factor alone, given its supporting position amid the complexity of organizational process, so efforts to focus in on this particular aspect, beyond the occasion of an isolated case study, would prove useful to create more generalizable knowledge. Regardless, the precarious nature of public programs generally does tend to reinforce the value of roles and practices that involve and connect contrasting viewpoints and priorities; boundary spanning will remain a focus of research, as a result.

# Branding's Strategy in Regional Policy

S. Fedyunina and G. Panichkina
Social Communication Department, Stolypin's Volga Region Institute of Administration – Russian Presidential Academy of National Economy and Public Administration, Saratov Branch, Saratov, Russian Federation

## Synonyms

Brand development; Regional brand

## Definition

The strategy that creates a brand at regional level by the regional authorities.

## Introduction

At the beginning of the twenty-first century, the region is becoming the subject of research as a geographical, administrative, economic, cultural, historical, and ethno-cultural unit. Ensuring a balanced socioeconomic development of regions as one of the targets of Russia's development requires synchronization of the following areas of regional policy: promoting economic development by creating new centers of economic growth in the region on the basis of competitive advantage, coordination of infrastructure investments and investment strategies of the state, and expanding market for regional products. Territorial boundaries of the production cycles in the economy can be divided into three types: national, regional, and local (Шнипер 1978). The majority of business processes occurs at the regional level. Synchronization of the directions can be achieved through regional branding technology.

Regional branding is a relatively new phenomenon for Russia with its high development potential. Successful brand plays an important role in the development of economy, culture, and tourism in infrastructure area of the region. Territorial branding creates the territory of "social climate," which would increase the attractiveness of the territory as investment object and living environment. This approach obliges local authorities, the "sellers," become active participants at the investment market, where they have to take a competitive position, to establish a niche for their "goods" (Паничкина and Черняева 2015).

## Key Issues in the Region

Since the objectives of this study is to analyze the status and prospects of Saratov region branding, let us turn to the strategy of socioeconomic development of the Saratov region up to 2030 "(http://saratov.gov.ru). The basis of the legal framework document is the federal law on June 28, 2014, № 172-FZ "On the strategic planning in the Russian Federation" and the Law of the Saratov region on April 28, 2015, № 56-OZ "On the strategic planning in the Saratov region."

The strategy is a global vision of the future of Saratov and provides the following steps:

- Definition of a system of strategic priorities of socioeconomic development based on a comprehensive assessment of the starting positions of the Saratov region, its competitive advantages and potential, taking into account the effects of external and internal factors in the long-term period.
- The formation of three-dimensional model of economic growth in the context of regional and municipal development.
- Steps and mechanisms to achieve the strategic priorities.
- A system of indicators to achieve the strategic priorities.

On the basis of SWOT analysis, the program identifies key problems of the region: strengths and weaknesses of the region and opportunities and threats, as well as the strategic priorities of Saratov on the federal and regional levels.

The key problems of the region are the following:

1. A significant proportion of sectors and services that traditionally have a minor tax potential (agriculture, public sector, and services) with a minuscule proportion of extractive industries, traditionally representing the main income source of budgets.
2. Insufficient number of enterprises producing finished products.
3. Low profitability of agriculture.
4. Low innovation activity of some enterprises, insufficient development of high-tech industries.

The performed SWOT analysis revealed the strengths of the region. The strengths of the socio-economic situation of the Saratov region are the following:

- Favorable transport and geographical position at the crossroads of transport corridors for the creation of transport and logistic nodes and executing transit functions and promotion of goods in the direction of "North-South" and "East-West"; there is objective prerequisites for the appearance of the functions of the region transport and logistic center.
- Significant resource potential: reserves of the mineral resource base, primarily building materials, high energy security, significant water resources, and the availability of land for agricultural production.
- A diversified industrial structure that includes: electricity, mechanical engineering and metal working, chemical and petrochemical industry, building materials industry, and food industry.
- Relatively favorable climatic conditions and geographical position of the region for the cultivation of major crops and the production of ecologically clean agricultural products.

Saratov has developed educational complex, high educational potential of human resources, sufficiently high scientific and innovative potentials. There is availability of investment areas and a favorable investment climate.

The strength of the Saratov region prevents weaknesses, among them are the following:

- A small fraction of the final production in the production of finished industrial products and, as a consequence, the share of low value added.
- The presence of imbalance between agricultural production and processing sector.
- High wear of the housing and communal networks, especially in rural areas, and the low rate of new facilities.
- Significant physical and moral depreciation of fixed assets of enterprises.
- Natural and climatic position of the region in the zone of risky farming.
- Negative demographic trends, which in the long term will lead to a decrease in the demographic potential.
- High levels of informal employment due to lack of quality jobs in some territories of the region.

## Analysis of the Saratov Region Development Potential

The opportunities for social and economic development of Saratov area include:

- Government support of the development of import substitution industries.
- Global food crisis, forming an increased demand for the products of agricultural sector and the food industry.
- The use of the former Soviet Union states market potential with a focus on countries of the Eurasian Economic Union, as well as the Asia Pacific region and Latin America; countries participating in the BRICS format to increase exports of Saratov enterprises.
- Intensification of cooperation with neighboring regions in terms of promoting products and services of the Saratov region, as well as implementation of joint projects.
- Realization of the investment potential of the region, reducing investment risks, attracting strategic investors in the economy and social sphere.
- Realization of the transit potential of the Saratov region, the creation of transport-logistic cluster, including the implementation of the

project on construction of the international transport corridor "Europe-Western China".

Potential threats to the socioeconomic development of the Saratov region are the following:

- Strengthening interregional competition in the labor markets, investment, and goods and services.
- Depletion of nonrenewable natural resources, including soil fertility, water resources, species diversity of flora, and fauna of the area.
- Limited service lives of existing power units.
- Reducing the financial assistance from the federal budget.
- The preservation of regional imbalances in the labor market.
- Reducing the quality of human capital area, the outflow of young population outside the region.

However, it should be noted that the program of development rather clearly defined strategic priorities and has a vision of the target area as a multiethnic and multicultural region, the territory of national peace and civil harmony.

It is expected that as a result of implementation of the strategy in 2030, a competitive basis of the economy of the Saratov region will develop high-tech industry clusters as concentrations of high value-added agriculture, attracting high-quality human resources and investment.

It is declared that by 2030, the Saratov region should be one of the most attractive place in the Volga Federal District and a place of social infrastructure development. High-quality education, health care, cultural benefits available, comfortable housing, a high level of safety, and a clean environment will create favorable conditions for the further and attract and retain highly skilled professionals to the region.

## The Development of the Region Based on the Analysis of Municipalities

To analyze potential and prospects for the development of certain areas of the Saratov region, a comprehensive analysis in the context of municipal districts and urban districts was carried out, which provided their analysis of attractiveness for the population and investors. Based on the analysis of the main indicators characterizing the quality of life of the population, municipal districts were divided into groups according to the degree of comfort for living and the availability of infrastructure.

Moreover, the analysis of migration flows allowed imposing differentiation in the degree of attractiveness of municipalities and municipal districts of the region to the public. The following main typologies of territories in terms of their development prospects can be identified in view of their development.

- Areas – "engines" (Saratov, Engels, Balakovo, Balashov), large industrial centers that can become points of growth and agglomeration centers for neighboring, less successful areas.
- Areas – "bioecological policy," with significant resource potential for the development of agri-food cluster, focused on the production of environmentally friendly products.
- Areas – "satellite infrastructure," located close to major transport infrastructure primarily at the federal level, the border areas, and tourist facilities.

In the long term, three possible scenarios of the region development are possible.

- Conservative – is based on the assumption that the inertial development of the economy and the preservation of the existing approaches to its management, where the region will grow mainly due to extensive expansion of the economy, by increasing resource utilization volumes. The dynamics of economic growth will slow down, and slow transformation as quality of life and living environment will lead to a further reduction of the population.
- Moderately optimistic – implies more efficient use of all resources with increased attention to the issues of improving business climate, creating favorable conditions for economic activities. However, positive changes in the economy will be accompanied by adequate positive changes in the social sphere with certain time delays.

– Innovative – focused on maximum disclosure of strategic capacity development, effective use of human capital, balanced development of the regions, and implementation of new approaches to the management of the region. This scenario contains basic elements of a moderately optimistic scenario, coupled with a significant influx of capital, the intensification of the development of the social sphere, more efficient use of resources, building human capital, and improving the parameters of innovation.

## Branding of the Territory as a Basis for Development of the Region

Regional branding is developing in Russia recently. Under the territory brand, we mean a set of unique qualities, timeless universal values that reflect the originality, and unique original consumer characteristics of the territory and the community, which are widely known, that received public recognition and steady demand of consumers of the territory. Simon Anholt defines a brand as a competitive identity, noting that area branding is a system process of harmonizing the actions, behaviors, investment, innovations, and communications of the state (territory) for implementation of a competitive identity (Anholt and Hildreth 2004). It can be concluded that branding has become an integral part of the activities of local authorities and local communities with appropriate signs, symbols, and identity.

We can consider the territorial branding in the following way: a strategy for increasing the competitiveness of cities, provinces, regions, geographical areas, and countries in order to attract investors, tourists, new residents, and skilled migrants, as well as the conquest of foreign markets (Fedyunina and Panichkina 2016).

Currently, territorial brands act as the main way of attracting people to the city. A common tendency in Russia is the outflow of population from the peripheral cities of the Russian Federation to the cities to megacities. Over the last decades, the situation in the Saratov region is characterized by migration of residents into larger cities: the youth, born in Saratov, goes to Moscow and St. Petersburg. School graduates from Saratov region come to get higher education in Saratov, but after graduation do not return to their native places, preferring to stay in Saratov. Thus, people in search of a better life migrate to a large (rich) city, believing to find there education, work, and family. Meanwhile, provincial cities are becoming empty and lose resources to increase competitiveness. Enterprises are being closed; small and medium businesses do not develop. In this situation, the government of the Saratov region believes that areas need branding, determining the identity processes in the settlements of the region. Active participation of the population in the life of any village, city, or the country is one of the most important tasks of the local authorities. The identity of inhabitants is becoming a significant factor of population involvement in the settlement management processes with particularly acute issue of territorial identity that arises when people make decisions about a place of residence and work.

Earlier, in the Soviet period, the city was no more than a habitat for the population; mayors mainly competed for cash and manpower. The past, the present, and the future of the city were separated from each other, and very few people thought of common senses. Now understanding of the city as a commodity is formed, and the success of the city is determined by the fact to what extent its inhabitants are attached to it and to what extent the city is attractive for investors and tourists. So for the heads of municipalities, the strategic objective is not only to increase the number of permanent residents but also to attract the most "visitors," who should not apply for permanent employment and permanent residence. They should be interested in a simple visit to the city or for a temporary occupation within it. An important part of the regional policy and the strengthening of the brand of the city may be something that areas infrastructures offer: offices with views to the River Volga, good high-speed Internet, and low-quality housing for rent. Innovative technologies for municipalities become the involvement of people in work and leisure, into the city debates

and branding design. Residents and visitors become agents of stories and stories about the city, its adherents, and custodians. Over the past year, in order to create a brand and enhance the attractive image of the territory, a large number of events were held: Tulip Festival in Novouzensk, area soup Volsk Festival, and Festival of Historical Reconstruction – "Uvek. A day in the life of a small city." This is only a part of the activities of the year, actually there were more than a hundred. For the basics of branding, various grounds are involved: climatic resources, architectural monuments and places of interest, cultural events, and culinary traditions and customs.

A clear delineation of cultural branding zones in the city – the area of business activity and competition, leisure and adventure, peace, and community cohesion – is necessary. Isolation of these zones should be determined by the choice of identification of the urban community and should become the basis of long-term urban development strategy. Such work is being done right now in Saratov; the map of the area with the release of various zones is being drawn. Since the identity of the brand is determined, inter alia, by a symbol or individuality, 2016 was declared the Year of the Saratov region; during the whole year, the 80th anniversary of the region is celebrated. Students and pupils participate in various competitions, preparing essays, posters, and videos about the region. The best works will be included in the exposition of museums and archives of organizations. It seems that this work will contribute to the development of a regional brand. It is particularly important that the work is carried out with different target audiences, participating in the activities, and this occasion forms the identity of the inhabitants of the city.

Regional branding must take into account the characteristics of different target groups. Interests of tourists and local residents, business community, and the authorities cannot be the same, and sometimes they even may conflict. Regional branding strategy should align the interests of these target audiences and through communication with them should form a stable brand positive territory, that is, what the attention of local authorities should be directed to.

## Conclusion

The above analysis of the region development allowed to identify strengths and weaknesses and to identify opportunities for regional progress. Innovation scenario of the Saratov region, which the city government is focused on, is aimed at maximum disclosure of the potential of strategic development, effective use of human capital, balanced development of areas, and implementation of new approaches to the management of the region. The implementation of this scenario assumes a substantial inflow of capital and strengthens the development of social sphere, more efficient use of resources, building human capital, and improving parameters and roles of innovations. It is in this plane regional authorities pursue policies, and the basis of the policy is the formation of territorial brand.

Regional brand is considered as a set of unique qualities, timeless universal values that reflects originality, and unique consumer characteristics of the territory and the community, which are widely known and received public recognition and steady demand of consumers of the territory.

# Bridging the Funding Gap

Philip L. Brooks
Brooks Consulting LLC, Pittsburgh, PA, USA

## Synonyms

Valley of death

## Introduction

All businesses need cash to exist. The sources for this cash may vary, but it is an unquestionable need. A recent study published by Failory (Kotashev) found that among the 80+ startups that were interviewed, financial problems were the third most common reason for failure. Marketing problems, including lack of product-market fit, was the most common source of failure (56%), followed by team problems (18%). Of those startups interviewed, only 16% shuttered due to lack of funding.

While money is not the most critical determinant for success, the need for it (perhaps in even modest amounts) is nonetheless essential to do even the most basic business tasks. This is not a modern business problem as this tale from the late nineteenth century penned by the author's great grandfather illustrates:

> *A Mr. Robertson solicited my services for the sale of sewing machines. He had the agency for the sale of Howe Sewing Machines. After a lot of persuasion on his part, I reluctantly consented. Having no selling experience, no horse, harness or wagon it looked like a forlorn hope. However, through his assistance I got the necessary rolling equipment and drove out into the country and succeeded in selling one machine as a result of the first day's efforts.*
>
> *I started out from Beaver Falls in the afternoon with only 30 cents as working capital and expense money. I stopped at a brick house to try for a sale, where I was given permission to show my machine. I carried it in, placed it on the floor and when I commenced to demonstrate its sewing qualities, it just would not work. While I was trying to get it to work, a train passed by and frightened my old horse so thoroughly, he took immediate flight in the same direction as the train, but not so fast. I overtook him before any damage was done, loaded my two machines into the wagon.*
>
> *The following morning, I sold a machine for cash at the farm home in which I lodged the night before, and in the afternoon sold another one in the same neighborhood. When driving back to home the next evening, my spirits were high, as I had surmounted the difficulties and discouragements of the day before. From that time on, I feel I have been a success as a sewing machine salesman. I don't believe many others have started in a business they knew nothing about under more adverse circumstances.*
>
> *I learned the Domestic Sewing Machine Co. [was] planning to discontinue their Pittsburgh office. A business friend and I formed a partnership under the name of Rodgers and Brooks and bought out the Domestic Business. We enjoyed success from the start and for three years our business proved prosperous, increasing each year. I continued the business the following fifteen years under my own name, when I also sold out…an experience of 35 years in the selling of sewing machines* (Brooks 1909).

Although this entrepreneurial venture began in 1870, so many elements of the story ring true for today's entrepreneur: a lack of equipment to start the business, insufficient working capital, a live demo gone wrong, persistence, the joy of making the sale, building a partnership, and before the blink of an eye – 35 years have passed. In this chapter, the focus is on one of these challenges: fundraising.

## Some Basic Fundraising Realities

The Rest of Us highlights some of the basic steps and terms you may encounter in their ten-minute video presentation, "Startup Funding Explained" (The Rest of Us 2016). While it may seem obvious, before you begin fundraising, you need to understand what you will need. See "Building a Financial Model" later in this chapter for a key step in developing your "ask."

The next step is determining who to ask. Potential sources for funding may include your own savings, gifts, grants, debt, equity, and revenue from customers. For an early-stage company, the most typical sources are Small Business Innovation Research (SBIR) or Small Business Technology Transfer (STTR) grants from the US federal government, economic development agency funding (often in the form of convertible notes), and/or patient advocacy research grants (e.g., Bill & Melinda Gates Foundation, Michael J. Fox Foundation). As these funds are used to further refine the technology and the business, once the company's value proposition and initial customer segments are defined and it's time to scale, the next sources are often angel or venture capital investors. See "Sources of Capital" for more details on the various types of potential funding.

Tom Walker, President and CEO of Rev1 Ventures, suggests that you should not assume that all fundraising options require an equity tradeoff, or at least not a big one. Some suggestions to consider:

1. *"Open your own wallet first*: . . .Knowledgeable investors want to see founders show confidence with cash. . .
2. *Sign up strategic partners early on*: . . .Early adopters provide [a] unique and invaluable hands-on perspective of what's right and what must be changed in order to improve the value proposition of your solution with respect to the markets you plan to serve. These companies will be less focused on final returns and more interested in getting your prototype to beta. . .
3. *Bootstrap*: Paying as you go by earning revenue from early adopters and [conserving cash] is the most cost-effective way to stretch your company's resources. . .
4. *Pursue non-dilutive capital*: Grants, solicitations, and RFPs. . .
5. *Match capital to milestones*: Matching capital requirements to achievable milestones keeps the company from giving up equity before it's required. . .
6. *Establish a line of credit*: Bankers will return your calls once one of their competitors has vetted you" (Kerpen 2015).

"When Carolyn Green left the University of Pittsburgh. . .to help start Logical Therapeutics Inc.,. . .they crafted a strong funding story and hit the road in search of investors. And the fledgling venture soon landed $30 million in venture capital from a San Francisco-based investor syndicate" (Green, Life Sciences Venture Capitalist and Pitt Alumna Carolyn Green Shares Five Lessons for Attracting Investors to an Early-Stage Life Sciences Start-up). While this is an impressive fundraising result, the company committed significant resources and effort achieving this milestone. Ms. Green offers these five recommendations (listed in italics):

1. "*Expect to invest lots of your own time and some money up front*";
   (a) Investors want to know that you are at least as committed as they are and, hopefully, a lot more. You will be more likely able to do this with your time rather than with money. However, personally investing even a modest sum shows investors that you are in this with them.
2. "*Develop a great 'story' for your company*";
   (a) Once you hone your story, you will have many opportunities to share the message – in short form (i.e., the elevator pitch), as part of your investor pitch, making a sale, and on your website.
3. "*You'll need personal introductions*";
   (a) Christian Manders, founder of the Pittsburgh BioBreakfast and COO of Promethean LifeSciences, Inc., suggests that you "build your network in advance, before you need the money" (Manders 2020).
   (b) "If you need to do a hundred pitches to get funding, then you aren't being selective enough," according to Kit Needham, Associate Director of Project Olympus at Carnegie Mellon University in Pittsburgh, PA (Needham 2020).
   (c) By speaking with the CEOs of investor's portfolio companies, you will have the opportunity to learn whether the investor is a fit for your company, but you may also establish a strong enough relationship with

the CEO that they will personally introduce you to the investor.

4. "*Think globally*"; and
   (a) Don't just look in your own backyard. Your company may be in Hartford, Connecticut, but you are able to apply to the Wellcome Trust's Innovator Award in London, United Kingdom (Innovator Awards n.d.). Individuals and teams from nonprofit and commercial organizations may apply for up to £500,000, or up to £750,000 for multidisciplinary collaborations.
5. "*It's all about risk*."
   (a) As an entrepreneur you take risks every day to advance your company's mission. You are asking potential investors to share in that risk. You need to give them sufficient information to assess both the level of risk and the potential rewards.

While a Corporate Development Partner for Andreessen Horowitz (a venture capital firm commonly referred to as a16z), Steve McDermid wrote that some companies are able to raise money within days of starting, but "for others it takes many, many months. Either way, be prepared for the process to take longer than you expect. Also give yourself plenty of cushion when assessing your cash runway" (McDermid 2015). Preparation is key when targeting a sufficiently large group of investors, so that you don't risk having to restart the process if you run out of targets without having obtained the funding you sought. Running your business well, while simultaneously fundraising, is a challenge, but is often a strong factor in winning over investors as they complete their due diligence. See "Due Diligence" later in this chapter to learn how to prepare for this critical element of fundraising.

## Create Your Pitch

As you refine your business model you should consider creating an elevator pitch. While you may have no prior sales experience, all entrepreneurs must play an active role in the marketing efforts for their technology/business. As the name suggests, the premise is simple: in the time an elevator takes to arrive at a potential investor's "floor," you must capture their interest in your innovation.

To develop the elevator pitch, start with refining your value proposition into a very concise and simply worded description of your innovation and the business opportunity it provides. Mel Pirchesky of Eagle Ventures, Inc. describes the elevator pitch as the first 10–15 seconds of an initial meeting during which you must be able to state "what you do and something that independently authenticates the importance of what you do. The objective [of which is them prompting] 'Tell me more'" (Pirchesky 2020). This is not very different than advice given for the preparation of a resume. Describe what you did at each previous job as well as quantifying the results.

The pitch is based on the value proposition. "The Value Proposition. . .describes the bundle of products and services that create value for a specific Customer Segment. The Value Proposition is the reason why customers turn to one company over another. It solves a customer problem or satisfies a customer need" (What is a Business Model 2019). Strategyzer offers a tool called the Value Proposition Canvas to guide its refinement (The Value Proposition Canvas 2020).

If you have cleared the first hurdle, and the prospective investor has asked, "Tell me more," you are potentially ready for the investor pitch. The investor pitch is most typically a brief (10–20) slide presentation.

Founders Fund principal, Delian Asparouhov, is quoted in the CB Insights article, *The Early Pitch Decks Of 21 Startups Before They Became Billion-Dollar Companies*, "In order to build conviction, we rely on founders to tell us a compelling story, almost always in the form of slides. We've funded companies almost entirely because of the quality of their seed decks. Poor deck? We'll likely pass on the opportunity" (Asparouhov 2020).

While there is wide latitude with what to include in (as well as the order of) an investor pitch, at a minimum, you should include the following:

- Problem that your innovation solves (often told through a story)
- Market potential
- Brief description of your innovation (nonconfidential and in layman's terms)
- Comparison to existing solutions
- Explanation of the development stage of your innovation
- Status of any intellectual property protection you have received to date
- Your team and why you are uniquely qualified to make this business successful
- Business model (i.e., how will you make money for your company and its investors)
- Your ask (how much money you are seeking and under what terms)

Catherine Mott, Founder and CEO of BlueTree Allied Angels, recommends that entrepreneurs highlight the business strategy and their knowledge of the industry because investors care most about return on investment (Mott, CEO/Founder BlueTree Allied Angels, 2020). She adds that intellectual property owned/licensed and how the technology works are less important.

After the presentation (typically 15–20 min), the focus shifts to the question-and-answer portion of the meeting. Here are some practices to consider as you respond to the investor's questions:

1. Anticipate the questions and have backup slides in your appendix to address them. Don't go overboard with these follow-up slides, however. You can get flustered trying to locate the appropriate slide and lose your audience's attention.
2. "No question is dumb, so answer them all with respect" (Mott, CEO/Founder BlueTree Allied Angels, 2020).
3. If you don't know the answer, don't try to make something up or develop one on the fly. Simply state, "I can't answer, but I can get back to you, if you like."
4. Many people buy time to answer by responding, "great question." Resist the urge because when you don't use it in your next response, that questioner is left diminished.
5. Provide succinct answers to allow everyone in the room to get their questions answered. If your answer is perceived as incomplete, the questioner will ask follow-up questions to become satisfied.

The business model, described above as one of the key components of the pitch deck, is supported by a "Financial Model".

## Building a Financial Model

Building a financial model with well documented assumptions and the flexibility to support sensitivity analysis on those assumptions is critical to both running your business, and convincing investors that your plan is solid. Templates and software for building financial models of varying complexity abound. You can build a model yourself by utilizing spreadsheet software such as Microsoft Excel or Google Sheets. Additionally, the US Small Business Administration (SBA) has over 900 Small Business Development Centers (SBDCs) spread across the country where you can connect with consultants to help you build your financial model (Find Local Assistance n.d.).

Ray Vargo, Director of the University of Pittsburgh SBDC (2020 winner of the national SBDC Excellence and Innovation Award), stated that consultants in his office will provide approximately 10 hours of free assistance with model building. The entrepreneur is largely responsible for collecting the relevant documents. These include 3 years of tax returns, prior year-end balance sheet, interim income statements, and solid/detailed assumptions about the business (Vargo 2020).

When presenting a business model during a pitch, one of the more common challenges is lodged against its underlying foundation. A strong financial model places you in a position to quickly modify any assumptions a potential investor challenges you on to more easily show the impact on your company's projected performance. If it has very little effect, the investor's uneasiness is quickly dispelled. If not, the inconsistency between their assumptions and yours

may make them lose interest. All is not lost, however, if you have strong supporting sources for these assumptions. The model offers a framework to focus the discussion on the (hopefully) few points of disagreement rather than a daunting list.

## Divide the Pie: Sharing the Equity

A common element of "Due Diligence" is the investors' request for a copy of your company's capitalization (cap) table. The cap table illustrates the individuals and organizations that own equity in the company and how many shares they own (Learned, Simple Capitalization Tables Instructions, 2016). Typically, the largest portion of common stock on the cap table is characterized as founder's shares. Also important is to develop an agreement on how, as the company grows, the founders and future employees will share in allocations of equity. "...[I]nvestors ... want to be sure the founders have adequate incentive to continue to work very hard right through the exit" (Learned & Dunlap, Capitalization Tables Demystified, 2019). To make this determination, the cap table is utilized to evaluate the impact on ownership of each round of funding to both the founders and investors. Kevin Learned of Loon Creek Capital offers a simple spreadsheet model to calculate the cap table (Learned, Simple Capitalization Table Model, 2019).

An early question for a startup that includes multiple founders, is focused on how to divide these shares. The default answer is to take the number of shares and divide by the number of founders. This implies that everyone who is an owner of the startup has contributed equally up to this point. This is rarely the case. While it is an easy choice now, when real money becomes involved it may lead to a lot of unhappiness.

Frank Demmler created a methodology and tool to address dividing the founder's pie. In his article, *Cutting Up the Founders' Pie*, he describes an approach to assess the contributions each founder makes to five primary elements that create enterprise value (Demmler, Cutting Up the Founders' Pie, 2009a). The five are: (1) Idea; (2) Business Plan; (3) Domain Expertise; (4) Commitment and Risk; and (5) Responsibilities. Demmler proposes that the founders first determine the importance weight of all five elements on a scale from 0 to 10, with 10 having the greatest importance. In the second step, each founder rates themselves on their contributions to each element (also on a scale from 0 to 10). The third step involves multiplying the weights by the contribution. Finally, the resulting values are summed for each founder and their relative percentage of the grand total is calculated. Demmler does not recommend accepting the resulting equity percentages without assessing and debating the reasonableness of each founder's share as a group. The framework serves as a tool to understand each other's perceptions about the importance of each element, and their anticipated contribution to each. This is much like the assumptions utilized by the entrepreneur and the investor in understanding the reasonableness of the financial model. He has also made a spreadsheet available to allow entrepreneurs to easily perform these calculations (Demmler, Founders Pie Calculator final, 2009b).

## Due Diligence

The National Venture Capital Association's (NVCA's) Principles for Operating a Venture Capital Fund state in part, "[a] venture capital firm will engage in reasonable and appropriate due diligence and legal review prior to making investments or divestments on behalf of the fund" (Principles for Operating a Venture Capital Fund n.d.). Entrepreneurs should expect that seasoned investors of all types – not limited to angels and VCs – will engage in some level of due diligence.

Serious potential investors will launch a formal due-diligence investigation. Often, at this stage, the investor will conduct a review of the business assumptions that are critical to determining the commercial value and potential of the innovation. This will include how the company plans to make money and how it will scale. They will test the assumptions of your "Financial Model" by performing sensitivity analysis utilizing

alternative inputs derived from their own market research, subject matter experts, and their own members with relevant experience. To develop confidence in the team, the investors will explore both prior successes and failures on a corporate and individual level.

> *Through Rob Wiltbank's ground-breaking study in 2007, angels in groups learned that collective due diligence on new deals really pays off. The 538 angels included in this study enjoyed 2.6X returns over the life of their investments. However, for deals on which collective due diligence totaled less than 20 hours, returns were only 1.1X. But, deals on which angel[s] put in over 40 hours of due diligence (the top quartile) returned 7.1X to angel investors. Due diligence clearly makes a big difference for angel investors* (Berry 2013).

David Eyler of Columbia University writes, "[t]he one thing that everyone in the venture industry is in harmonious agreement on is that management is absolutely critical and the single most important aspect of a deal" (Eyler 2007). Eyler identifies the following seven elements for assessing management during due diligence:

1. Credentials
2. Legal Background Check
3. Mindset
4. Leadership Ability
5. Honesty and Integrity
6. Intelligence
7. Good Judgment

This is merely one portion of the due diligence process. "A 2007 study found that angel investments in which at least 20 hours of due diligence was done were five times more likely to have a positive return than investments made with less due diligence time" (Hudson 2015). One quickly realizes this assessment is potentially very time consuming. As an entrepreneur you should do your own assessment of the investors you plan to approach. This assessment should include asking the expected timing for the investor's due diligence process. If it is going to take months for them to complete, you may want to look elsewhere.

So, what else will investors seek for their evaluation? Tony Lettich, CEO and Co-founder of Funding Sage, presents fourteen types of information they may request:

1. Investor Pitch Documents
2. Organizational Documents
3. Management & Organization Information
4. Board of Directors
5. Contact Information
6. Intellectual Property
7. Development Plans
8. Products/Services
9. Customers & Clients
10. Material Contracts
11. Financial Information
12. Information Technologies
13. Environmental
14. Legal Information (Lettich 2020)

From the initial application, through due diligence, and ultimately term sheets and investment documents, a tremendous amount of information needs to change hands from entrepreneur to investor. A variety of companies have sprung up to manage this document flow, including Attio, Gust, ProSeeder, and Seraf.

If the investor is satisfied with its due diligence effort, the two parties will enter into a negotiation of key investment elements and detail them in a term sheet. NVCA in partnership with investment analytics company, Aumni, developed an Enhanced Model Term Sheet (National Venture Capital Association 2020).

## Sources of Capital

There are a broad range of potential sources of capital. Within each category there are numerous individual programs or organizations to choose from. The entrepreneur must first evaluate which type(s) are appropriate for their current stage of development, and then which organizations to approach. "...finding the right source of capital is far more complicated than just getting cash to fuel your business idea. Some entrepreneurs are so eager to get money that they do not apply enough scrutiny in assessing their investors. The decision on where to raise money will impact your ability

to succeed as a business and has far reaching consequences. So, entrepreneurs should choose wisely and be aware of the downside of bringing investors in" (Stefanovo 2014).

Sources of capital include the following:

1. Angels
2. Accelerators
3. Competitions
4. Crowdfunding
5. Economic Development
6. Friends & Family
7. Foundations
8. Grants
9. Microloans
10. Paid Pilots
11. Private Equity/Family Office
12. SBA Loans
13. Self-fund
14. Strategic Investors
15. Venture Capital

What follows is brief detail on a subset of these sources.

## Angels

Angels are high net worth individuals who make investments in early stage businesses in order to own part of the company and hopefully gain returns that are greater than investing in the stock market. As an entrepreneur, you should only seek investments from angels who qualify under the US Securities and Exchange Commission's definition of an Accredited Investor.

An Accredited Investor is anyone who:

- "earned income that exceeded $200,000 (or $300,000 together with a spouse) in each of the prior 2 years, and reasonably expects the same for the current year, OR
- has a net worth over one million dollars, either alone or together with a spouse (excluding the value of the person's primary residence)" (Updated Investor Bulletin: Accredited Investors 2019).

Angel groups are "[i]ndividual angels . . . joining together with other angels to evaluate and invest in entrepreneurial ventures. The angels can pool their capital to make larger investments. ACA [Angel Capital Association] has more than 400 angel groups in its database and many more across the globe. Angel organizations come in many forms, but all have certain characteristics:

- They meet regularly to review business proposals
- Selected entrepreneurs make presentations to the membership of the group
- Member angels decide whether to invest in the presenting business
- Angels work together to conduct due diligence to validate the plans, statements and history of the entrepreneurial team

Other points of interest and important statistics about angel groups are:

- The size of angel group investments in entrepreneurial firms varies widely. The average ACA member angel group had 42 member angels and on average, invested a total of $2.42 million in 9.8 deals per year in 2015.
- Between 10,000 and 15,000 angels are believed to belong to angel groups in the US.
- Many angel groups co-invest with other angel groups, individual angels, and early-stage venture capitalists to make investments of $500,000 to two million dollars per round.
- Groups invest in innovative firms in a range of industries. The most common areas are software, medical devices, telecommunications, and manufacturing.
- While some groups focus on a specific industry area, the majority are open to a variety of areas and select those markets with which some of their members have expertise" (Angel Capital Association 2020b).

The Angel Capital Association Member Directory (Angel Capital Association 2020a) is a good resource to identify specific angel groups.

## Accelerators

"The startup accelerator remains one of tech's most popular ways to get a business up and running. But which ones are the best for new

startups? With hundreds of programs to choose from . . . not all accelerators are created equal" (Konrad, The Best Startup Accelerators of 2017, 2017).

Susan Cohen and Yael Hochberg define the accelerator as, "[a] fixed-term, cohort-based program, including mentorship and educational components, that culminates in a public pitch event or demo-day" (Cohen and Hochberg 2014). Founded in 2005, Y Combinator is widely claimed as the first accelerator. In 2016, Ian Hathaway identified 700 US-based accelerators. However, when applying Cohen's and Hochberg's accelerator definition, two thirds of the original group were excluded (Hathaway, Accelerating growth: Startup accelerator programs in the United States, 2016). On average, accelerators take 6% equity in each company they accept, and the most popular accelerators receive up to 5,000 applications per cohort (Konrad, The Best Startup Accelerators of 2017, 2017).

Table 1, reprinted by permission from Hathaway (email communication between I. Hathaway and P. Brooks on November 20, 2020) compares accelerators to incubators, angels, and hybrid models across numerous criteria (Hathaway, Accelerating growth: Startup accelerator programs in the United States, 2016).

The Seed Accelerator Rankings Project (SARP) classifies the top accelerators into several categories. The classification is based on a weighted assessment of Valuation, Qualified Exit, Qualified Fundraising, Survival, Founder Satisfaction, and Alumni Network. Rankings published in 2018 note that Y Combinator, AngelPad, and StartX share the top category of "Platinum Plus" (Seed Accelerator Rankings Project 2018).

## Competitions

Competitions, whether university-based or community-based, are increasingly the source of rather significant pre-incorporation and/or non-dilutive funding. These competitions may offer small or large prizes, exist in your own community or internationally, include broad publicity or limited social media mentions. As an example of utilizing competitions to assemble a substantial war chest, TopoGraft is a unique biomimetic technology designed to reduce thrombosis of prosthetic arterial grafts and mechanical circulatory support circuits. Invented in 2015 by a University of Pittsburgh (Pitt) chemical engineering professor, and a University of Pittsburgh Medical Center (UPMC) vascular surgery resident, and tested by an undergraduate student researcher, TopoGraft was identified by Pitt's Innovation Institute as a promising high value technology. In 3 years, the team raised $165,000 (see full funding history in Table 2) from Pitt entrepreneurship competitions

**Bridging the Funding Gap, Table 1** Key differences between incubators, angel investors, accelerators, and hybrid early-stage investors

| | Incubators | Angel investors | Accelerators | Hybrid |
|---|---|---|---|---|
| Duration | 1 to 5 years | Ongong | 3 to 6 months | 3 months to 2 years |
| Cohorts | No | No | Yes | No |
| Business model | Rent; nonprofit | Investment | Investment; can also be nonprofit | Investment; can also be nonprofit |
| Selection | Noncompetitive | Competitive, onging | Competitive, cyclical | Competitive, ongoing |
| Venture stage | Early or late | Early | Early | Early |
| Education | Ad hoc, human resources, legal | None | Seminars | Various incubator and accelerator practices |
| Mentorship | Minimal, tactical | As needed by investor | Intense, by self and others | Staff expert support, some mentoring |
| Venture location | On-site | Off-site | On-site | On-site |

**Bridging the Funding Gap, Table 2** TopoGraft/Aruga funding history

| Year | Funding source | Amount |
|---|---|---|
| 2015 | Center for Medical Innovation Award | $ 20,000 |
| 2016 | Pitt Ventures NSF I-Corps Site First Gear (medical markets) | $ 3,000 |
| 2016 | Center for Medical Innovation Award | $ 25,000 |
| 2016 | Kuzneski Innovation Cup (third place) | $ 3,000 |
| 2016 | Pitt Ventures NSF I-Corps Site First Gear (industrial markets) | $ 3,000 |
| 2017 | Chancellor's Innovation Commercialization Fund | $ 50,000 |
| 2017 | NSF National I-Corps Team Grant | $ 50,000 |
| 2017 | Pitt Ventures NSF I-Corps Site Second Gear | $ 6,000 |
| 2017 | Michael G. Wells Competition (third place) | $ 5,000 |
| | **TOTAL** | **$165,000** |

and internal grants (University of Pittsburgh 2019). With commercialization support from the Innovation Institute, the inventors spun out Aruga Technologies as a seed-stage company to finance a round of capital to begin FDA product testing and to acquire government contracts. In late 2018, Aruga was accepted into LifeX™, a life sciences incubator in Pittsburgh, where entrepreneurs-in-residence are supporting early-growth stages and company development.

A number of competitions attract teams/companies from across the United State and around the world. Some of the more well-known include:

1. **Rice Business Plan Competition** – characterizes itself as the "largest and richest graduate student startup competition" (Rice Business Plan Competition n.d.)
2. **Atlantic Coast Conference InVenture Prize Competition** (ACC Inventure Prize n.d.)
3. **Baylor New Venture Competition** – with a "focus on encouraging student entrepreneurs worldwide to catalyze and grow their business" (Baylor New Venture Competition n.d.)
4. **IBM Watson AI XPRIZE** (IBM Watson AI XPRIZE) – one of several focused multi-million-dollar competitions sponsored by the XPRIZE Foundation (AI to Solve Global Issues n.d.)
5. **AlphaLab Gear Hardware Cup** – a touring pitch competition for early-stage hardware startups in six US regions along with partner-led international competitions (AlphaLab Gear Hardware Cup 2021 2020)
6. **New Venture Competition** – in its 47th year, the Whitney M. Young Conference is launching this competition to showcase a new generation of Black innovators (Powering a New Generation of Black Innovators 2020)

## Crowdfunding

"Crowdfunding is about persuading individuals to each give you a small donation – $10, $50, $100, maybe more. Once you get thousands of donors, you have some serious cash on hand.

This has all become possible in recent years thanks to a proliferation of websites that allow nonprofits, artists, musicians – and yes, businesses – to raise money. This is the social media version of fundraising.

There are more than 600 crowdfunding platforms around the world, with fundraising reaching billions of dollars annually, according to the research firm Massolution" (The Basics of Crowdfunding 2020).

Some of the more popular crowdfunding sites include:

1. **AngelList** – "Over 5,000 companies funded on AngelList through syndicated deals and funds" (Venture AngelList n.d.)
2. **Go Fund Me** – fundraising for individuals, groups, or organizations (Go Fund Me 2010–2020)
3. **Indiegogo** – "Acquire starter capital and validate your idea by tapping into Indiegogo's

global network of early adopters" (Indiegogo for Entrepreneurs 2020)

4. **Kickstarter** – "Kickstarter's mission is to help bring creative projects to life" (Kickstarter 2020)
5. **Honeycomb Credit** – "expansion loans crowdfunded from your customers and fans. Share your successes with the community, without giving up ownership" (Honeycomb Credit n.d.)

## Economic Development

These organizations are typically governmental organizations or nonprofits with a mission to build local, state, national, or world economies. One of the key drivers for economic development is job growth. Much of today's job growth comes from startups and small businesses.

The State Science & Technology Institute (SSTI) is a nonprofit organization that includes a large membership of US-based Technology-Based Economic Development (TBED) organizations. (State Science and Technology Institute (SSTI) n.d.)

"The award-winning Ben Franklin Technology Partners is one of the nation's longest-running technology-based economic development programs. For more than 31 years, BFTP has provided both early-stage and established companies with funding, business and technical expertise and access to a network of innovative, expert resources" (What is Ben Franklin Technology Partners? 2017). The previously mentioned AlphaLab Gear Hardware Cup is funded by the Western Pennsylvania regional office of BFTP, Innovation Works.

The US Economic Development Administration (EDA) is a bureau within the US Department of Commerce. "EDA provides economic development financial assistance to communities so they can encourage innovation and entrepreneurship in a way that works best for them. Through its network of regionally-based staff and portfolio of flexible grant tools, EDA helps communities experiencing economic distress, take control of their future and position themselves for economic prosperity and resiliency" (About EDA n.d.). LifeX, the life sciences incubator mentioned previously, is funded, in part, by an EDA grant. In fiscal year 2020, EDA launched the "Build to Scale program." Through this program, select entities are provided multiple-year funding to "build regional economies through scalable startups" (Build to Scale Program).

These entities include accelerators, angel groups, the blue economy (freshwater and marine related businesses), investor training programs, universities, and nonprofits. The 2020 program included: "three competitions supporting entrepreneurship, acceleration of company growth and increased access to risk capital across regional economies" (Build to Scale Program). The venture challenge awards that year ranged from approximately $300 K to $1.5 million.

Bloomberg ranks South Korea second to Germany in its 2020 Innovation Index. President Park Chung-hee began the country's economic development focus in 1961 and maintained it as a priority for 20 years until his assassination. "By 2010, South Korea had 105 regional innovation centres and 18 techno-parks, as well as 7 federal programmes to strengthen the competitiveness of industrial cluster programmes. . . . The South Korean government's systematic approach has been the crucial factor in creating an innovative economy adept at turning ideas from laboratories into products and industries" (Dayton 2020).

*Women's Entrepreneurship Day Organization (WEDO) . . . was founded in 2013 as a non-governmental, non-racial, non-gender, and non-political volunteer non profit organization. Our movement was established to bring awareness to the 250 million girls living in poverty globally that deserve to be given a chance in life, while simultaneously inspiring and empowering the 4 billion women on the planet! . . . Our movement accelerates and educates the world on the importance of why it's pivotal to empower women in business globally. WEDO convenes Business Leaders, Change Makers, Government Officials and Civil Society to collaborate and find solutions in critical areas of entrepreneurship ecosystems, education and policy creation to empower women in business. WEDO is celebrated at the United Nations and in 144 countries and 65 universities/colleges internationally. When women are elevated financially, communities and countries prosper. It builds a*

*global blueprint to alleviate and eradicate poverty* (Women's Entrepreneurship Day Organization 2020).

"The Israel Innovation Authority, an independent publicly funded agency, was thus created to provide a variety of practical tools and funding platforms aimed at effectively addressing the dynamic and changing needs of the local and international innovation ecosystems. This includes early-stage entrepreneurs, mature companies developing new products or manufacturing processes, academic groups seeking to transfer their ideas to the market, global corporations interested in collaborating with Israeli technology, Israeli companies seeking new markets abroad and traditional factories and plants seeking to incorporate innovative and advanced manufacturing into their businesses" (Israel Innovation Authority n.d.).

Programs such as these outlined in the small sample above exist in countries all over the world. Economic policy that ignores the powerful impact of small businesses is fortunately a rare circumstance in today's global economy.

## Foundations

Foundations are organizations formed by individuals/families/corporations who share a common mission to provide grants to support entities that address similar goals. These missions might include addressing environmental impacts, or finding cures/treatments for diseases. If your startup aligns with a foundation's mission, you might consider contacting them to learn whether they are willing to provide grants to your business.

"Grantmakers of Western Pennsylvania (GWP) is a professional membership association formed in 1985 by leaders who wanted to create a place where grantmakers could learn and work together to increase their community impact" (Grantmakers of Western Pennsylvania 2014). While based in Western Pennsylvania, its membership is not geographically limited to that region.

In 2019, Foundation Center and GuideStar came together to form Candid. The focus of the merged organization is to link the people and organizations that are making an impact with the resources that are required to implement that impact. Through Candid's Glass Pockets transparency initiative, over 100 foundations are sharing 27 attributes of their organizations including governance policies, financial information, grantmaking information, and performance measurement (Candid 2020).

The list below offers a brief list of foundations to consider:

1. Bill & Melinda Gates Foundation (Bill and Melinda Gates Foundation 1999–2020)
2. Juvenile Diabetes Research Foundation (Juvenile Diabetes Research Foundation n.d.)
3. Michael J. Fox Foundation (Michael J. Fox Foundation n.d.)
4. Richard King Mellon Foundation (Richard King Mellon Foundation n.d.)
5. Stand Up To Cancer (SU2C) (Stand Up To Cancer 2008–2020)
6. The Forbes Funds (The Forbes Funds n.d.)
7. The Heinz Endowments (The Heinz Endowments n.d.)
8. The Pittsburgh Foundation (The Pittsburgh Foundation 2020)
9. Wellcome Trust (Wellcome n.d.)

## Grants

Non-dilutive grants allow a startup company to obtain funding to de-risk some of its technology challenges without a requirement to provide equity in exchange and no money is required to be paid back. These grants are available from the federal, state, and local government.

What has become known as America's Seed Fund is the SBA's Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) programs (SBIR * STTR America's Seed Fund n.d.). This federal program provides grants to small businesses

(under 500 employees) to fund research and development projects oriented toward commercializing innovative technologies. As of 2019, Phase I award budgets up to $256,580 and Phase II awards up to $1,710,531 are allowed. The funds are sourced from 11 agencies (e.g., National Institutes of Health, Department of Defense, and National Science Foundation) with extramural research and development (R&D) budgets that exceed $100 million. The current set aside from these agencies requires that they allocate 3.2% of their annual R&D budget in support of the SBIR/STTR program.

These SBIR/STTR grants are extremely competitive with paylines and success rates that vary by year, agency, and grant phase. A grant proposal's impact score established during its review is compared to each agency's payline to determine if they will fund the proposal (NIH Paylines and Success Rates 2020; NIH SBIR/STTR Award Data 2020). National Institutes of Health Research Portfolio Online Reporting Tools (RePORT) provides an advanced search tool that allows the user to search both active and completed grant projects. A specific tool called Matchmaker enables one to find program officials and/or similar projects based on entering a brief description of your own anticipated project (NIH Reporter 2020).

The SBIR/STTR grant proposal process is complicated. As a result, a number of states have created programs to support early-stage businesses with programming about the application process and/or funding to partially defray the cost of hiring a grant support consultant. Examples of such programs include the Pennsylvania Innovation Partnership (Innovation Partnership 2020) and the ScaleUp West Virginia SBIR/STTR Assistance Program (Scaleup West Virginia 2020). The SBA provides a summary of SBIR/STTR state matching programs by phase. Some are cash matches for successful grant recipients and some are funds to assist in proposal writing. (SBIR/STTR Phase 0 State Matching programs 2020).

## Venture Capital

Venture capital firms raise capital from limited partners (LPs) to form funds. These LPs are most typically public employee pension funds, endowments, insurance companies, and philanthropic foundations. The LPs and venture capital investors enter into a limited partnership agreement, which establishes key operating criteria that include the industry segment focus, company development phase (e.g., pre-revenue, annual recurring revenue of at least five million dollars), and the amount of time it will take to return money back to the LPs (typically 5 or 10 years).

Venture capital firms typically invest at later stages than angel investors. Many of the same methods used for identifying appropriate angel groups, however, also work for venture capital firms. Tools like CB Insights (2020) and PitchBook, permit entrepreneurs to "research and analyze companies, deals, funds, investors and service providers across the entire private investment lifecycle" (PitchBook 2020) – both venture and angel. Using these tools you are able to identify which groups/firms are investing in companies similar to yours and, therefore, may have an interest in looking at your company. These are expensive subscription services, so you may want to first explore obtaining access at a local business library, SBDC, or economic development organization. Participating in business plan competitions and venture capital fairs are other ways to network and learn more about venture capital firms (3 Rivers Venture Fair n.d.).

Forbes in partnership with TrueBridge Capital Partners published the 19th annual Midas List in 2020. This list ranks the 100 best venture capital investors "by their portfolio companies that have gone public or been acquired for at least $200 million over the past five years, or that have at least doubled their private valuation since initial investment to $400 million or more over the same period" (The Midas List 2020). The NVCA offers a membership directory (National Venture Capital Association n.d.-a) and a regional venture capital

group directory (National Venture Capital Association n.d.-b).

PitchBook describes the global venture capital firm, 500 Startups, as the "Most active early stage investor in the world." They have "backed more than 2,400 companies or 5,000+ entrepreneurs in 75+ countries" (500 2010–2020).

## Private Equity

Private equity is where stock in a company is not listed publicly on an exchange, such as the New York Stock Exchange. Often the same groups that invest in venture capital firms also fund private equity investments. These types of investments are typically for larger and more established companies. They are seen less frequently in the early-stage market. Family offices are where the private equity is held by a group of family (sometimes extended) members to invest and more closely manage the family's money.

Some examples include Incline Equity Partners (Incline Equity Partners 2020), and the McGeever Family Office (McGeever 2020) with its unique additional resources through LCO Capital and SalesForce4Hire.

## Conclusion

There are numerous types and sources of capital to fund your business. Your ultimate success may actually depend on more than one of them as the company grows. You will need to prepare in order to convince others to invest in your vision.

Carolyn Green's advice is an appropriate recap of the process. She reminds us to:

- "Expect to invest lots of your own time and some money up front
- Develop a great 'story' for your company
- You'll need personal introductions
- Think globally
- It's all about risk" (Green, Early-stage Life Sciences Start-up Funding)

Do not do it alone. You have many resources to assist you to find a method for bridging your funding gap. These include the technology transfer office of your university, SBDCs, accelerators, economic development organizations, national government support programs (e.g., Startup India (Looking for Funding? 2020), Your Europe (Access to Finance 2020) your local business library, and your own personal network.

## Bridging the Skills Gap in the Bahamas

Robert W. Robertson
Bahamas Technical and Vocational Institute, Tampa, FL, USA

### Synonyms

Disaster management; Economic development; Education; Online education; Skills gap; Technical and vocational training; The Bahamas; Workforce development

### Definition

The skills gap refers to the differences between the needs of the business and the actual capabilities of prospective employees. This gap is identified as impeding economic development and economic growth in many countries including the Bahamas. The skills gap in the Bahamas is exacerbated by Hurricane Dorian and the COVID-19 pandemic generating innovative educational options including online industry certified trade training.

### Introduction

Globally, governments are struggling to address the impacts of the COVID-19 pandemic which has impacted social, political, and economic interests. High unemployment, a significantly reduced GDP, and stresses on the healthcare and education systems are only a few of the impacts. For example, the global COVID-19 pandemic has dramatically changed the face of education across the world from classroom and face to face, to home and online – a revolution in how we will learn and train forever. Most research suggests that there will be a period of higher unemployment and an increased need for a more highly skilled workforce. Governments globally are struggling to manage the short and long-term impacts of this pandemic (International Labour Organization 2020). The International Labour Organization (2020) reports that "the world of work is being profoundly affected by the global virus pandemic. In addition to the threat to public health, the economic and social disruption threatens the long-term livelihoods and wellbeing of millions."

Another important impact is related to education. The OECD notes that the COVID-19 crisis has forced school closures in 188 countries, heavily disrupting the learning process of more than 1.7 billion children, youth, and their families (OECD 2020). Further, the World Economic Forum (2020) highlights the following:

- The COVID-19 has resulted in schools shut all across the world. Globally, over 1.2 billion children are out of the classroom.
- As a result, education has changed dramatically, with the distinctive rise of e-learning, whereby teaching is undertaken remotely and on digital platforms.
- Research suggests that online learning has been shown to increase retention of information and take less time, meaning the changes coronavirus have caused might be here to stay.

The pivot to online education to address the pandemic has not been easy in many instances. There are always questions and concerns about the equity of access to the basic tools (computers and the Internet). In fact, shortly before the pandemic outbreak, a survey noted that 6 in 10 online learning administrators say their campuses require professors to train before teaching online – but 70% say students aren't formally prepared to study virtually (McKenzie 2020) creating concerns about learning quality.

Another recent survey conducted by CHLOE (Legon and Garrett 2020) confirmed that about 70% of respondents noted that students looking to study online do not have to take any orientation related to that mode of study.

Legon and Garrett (2020) state that "given the known difficulties of students adjusting to online study and the higher dropout rates, we considered the figures for required online student orientation . . . as surprisingly low." This CHLOE survey suggests that most professors are moving on ground content online with limited support which may reduce the potential positive impact of online courses; indeed, the survey authors note that ". . .the brand of virtual education most of them (students) are seeing right now isn't the sort of high-quality online education that is possible when it is designed thoughtfully with help from professionals and well-trained professors" (Legon and Garrett 2020).

Overall, the data from the CHLOE "collectively show that most institutions aren't prepared to flip a switch and move all their learning into truly online settings" said Legon (Legon and Garrett 2020). Indeed, crises, like the pandemic, often can afford challenges and opportunities for innovation and new opportunities for the education sector.

In addition to COVID-19 impacts, the Bahamas has a compounding challenge. Specifically, the Government of the Bahamas is dealing with the results of a major Category Five hurricane. The Hurricane Dorian disaster (September 1–3, 2019) had an estimated impact of $ 3.4 billion or approximately 25% of the GDP of the country (IDB 2019). By comparison, this loss would be equal to losing the economic contribution of Florida, Texas, and California in the United States (IDB 2019). Damage to the housing sector included approximately 3000 homes with an impact estimated at $ 1.48 billion (IDB 2019). In particular, the hurricane has generated an increased urgency of addressing the skills gap – from on-the-job training to accelerated, blended, and certificate-based skills development and SME creation.

Clearly, the combined impact of the pandemic and the hurricane represents an unprecedented political, social, and economic challenge to the Bahamas. A key policy response advanced by the Government of the Bahamas has been to focus on the need to develop more capacity within the labor force notably in the areas of technical and vocational education such as the trades and information technology.

## The Bahamas Technical and Vocational Institute

The Bahamas Technical and Vocational Institute (BTVI) is the national, public, and tertiary community college which has been fully engaged in responding to these critical and urgent national priorities. In fact, the government directed an increase in public scholarships to support skills-related training to address pressing workforce skills gaps related directly to Hurricane Dorian and COVID-19. These scholarships are aimed at supporting more than 1200 students per year (Lloyd 2020). Initially established in 1980, in part, these scholarships were designed to bridge the national skills gap in the Bahamas which includes approximately 65% of businesses stating that the quality of employees is not satisfactory (The Tribune, 2019). BTVI offers certificate, diploma, and associate degrees as well as customized training. The key areas of enrollment are in information technology; office and business; cosmetology; and the trades. BTVI is a Cisco Academy, a City & Guilds center, and it has received CompTIA awards of excellence for regional leadership in IT. In addition, BTVI has been pursuing registration with the National Center for Construction Education and Research (NCCER). The purpose of pursuing NCCER certification is to facilitate offering accelerated, focused, and certified trade courses.

At the start of the 2020 spring term, BTVI was serving approximately 2200 traditional on ground, face-to-face students in Nassau, Freeport, Abaco, and Andros delivering more than 450 classes primarily using a face-to-face model. In

response to the pandemic, BTVI has undertaken the following.

## Online Education

A key direction that BTVI has advanced in the past few years has been to develop the capacity to offer online education and online training. In that regard, many faculty members have been trained to develop and offer online courses. There is more to do in this area, but BTVI has made tremendous steps in advancing online education. At the onset (March 2020) of the pandemic, approximately 40 mostly IT courses were being delivered in a blended mode, and this afforded a model for moving all courses online.

The technology infrastructure at BTVI had been improved over the past few years including the addition of computer labs and smart classrooms. These improvements made the transition to online more effective. Although there remains more work to be completed to support a smart campus concept, the improvements are being made incrementally as budgets dictate.

Globally, the transition to online education has accelerated dramatically with the COVID-19 pandemic. In response, BTVI moved almost all the 450 classes offered during the spring 2020 term that were moved to an online format using the Moodle learning management system. These courses were supplemented with case studies, simulations, videos, and Zoom classes. Although some classes in the trades are particularly difficult to accommodate, more than 95% of classes across the system continued online. In addition, for the trade-related courses, alternatives to ensure student success for all students were made using "boot camps" of small, face-to-face, hands-on practical sessions. The intention has been to use a blended format of the "theory" component online and the "practical" component on ground.

As a certified Cisco Academy and CompTIA award-winning institution for leadership in the Caribbean and Latin America, BTVI is uniquely qualified to be an online center of excellence. In that regard, a Centre for Online and Distance Education was established at BTVI in the spring of 2020.

Unfortunately, many efforts to pivot to online education in response to the pandemic were less than successful. For example, "the brand of virtual instruction that most professors and students are doing on the fly right now could damage perceptions of online education" (Legon and Garret 2020). Indeed, Legon and Garret argue that for those with a limited background in online education, the response to the pandemic will simply confirm existing stereotypes of online learning.

## Intensive Online Faculty Training

A key to a successful online program is the importance of faculty training. In that regard, additional training related to online education was initiated, in part, through a grant from the Commonwealth of Learning (COL). The Commonwealth of Learning is an "intergovernmental organization created by the Commonwealth Heads of Government to promote the development and sharing of open learning and distance education knowledge, resources and technologies" (Commonwealth of Learning n.d.). Twenty-two faculty members completed this training, and the Ministry of Education had a participant in the training. Additionally, five faculty members were identified to complete a program to be certified as a lead online instructor. An important outcome of this COL project is the creation of five blended courses (Information technology, numeracy, literacy, entrepreneurship, and student success) that will be rolled out primarily for dual enrollment purposes.

## Faculty and Staff Professional Development: Online

During the initial lockdown period (March–July 2020), BTVI faculty and staff remained actively engaged in upgrading their professional credentials. More than 90 completed Occupational Safety and Health (OSHA) certification as a safe workplace is a key in all sectors. Many

jurisdictions are developing COVID-19 construction guidelines including OSHA.

Ten staff members completed training on the financial and registration systems (Empower) to ensure a fully online registration process is available for students.

Also, a number of other short, online courses (emergency preparedness, management, and leadership) were completed.

In addition, a series of courses including an Introduction to Computers and Online Education were developed and made available for all faculty members. These short courses can be packaged as "nano degrees." This program uses open education resources and includes a number of industry-recognized certifications. The purpose of these courses is to assist instructors in being more effective particularly in the digital classroom.

In total more than 1100 h of training was completed by faculty and staff between March and August 2020.

In general, there is a need to build better competency among the teaching faculty and support staff. As a part of this initiative to focus on training, faculty members have been encouraged to develop individual training plans.

It is anticipated that some of this training could be made available at low cost to family island high school technology and vocational teachers to build capacity at that level as well.

## Accelerated Technical Training Program

BTVI has developed an accelerated technology training program. This accelerated program is aimed at quickly developing a trained workforce to address the national skills gap and provide training specific to the trades including courses in carpentry, plumbing, electrical, and masonry over a focused period of 10 weeks. The program is based on certification in the trades available with the National Center for Construction Education and Research (NCCER). This key program includes professional certifications to ensure that the graduates meet industry standards, including safety standards that will be of increasing importance post-COVID. The mandate of the NCCER is to "share the common goal of developing a safe and productive workforce via a standardized training and credentialing program" (NCCER n.d.). Indeed, the safety response to COVID-19 vitally needed by the construction industry mandates that BTVI supports and elevates the applicable training to ensure workplace safety. The Commonwealth of Learning has produced a "best practices" document that has assisted in delivering technical projects online (Commonwealth of Learning 2020).

In particular, the intent is to work in cooperation with the Bahamas Contractors Association to initially and immediately assist in the rebuilding efforts required in the Hurricane Dorian impacted areas of Abaco and Grand Bahama. This key program includes professional certifications to ensure that the graduates meet industry standards including safety standards that will be of increasing importance. The mandate of the NCCER is to "share the common goal of developing a safe and productive workforce via a standardized training and credentialing program" (NCCER n.d.). Indeed, the safety response to COVID-19 vitally needed by the construction industry mandates that BTVI supports and elevates the applicable training to ensure workplace safety. The first step in advancing this initiative was to hold a "train the trainer" seminar which certified approximately 100 craftsmen and women to NCCER standards. The second step of training students, particularly on those islands impacted by Hurricane Dorian, is underway.

Overall, the development of the skills within the key trade areas will assist in reducing unemployment and having more Bahamians certified and therefore in a position to participate in the economy in a tangible way as rebuilding efforts take place in the country.

## Student Satisfaction

BTVI conducts a regular student satisfaction survey.

The most recent survey was conducted during the lockdown phase (March to June 2020), and it included responses from more than 200 students. Overall, 85% of student respondents stated that

their experiences with respect to online courses at BTVI were "good."

This survey is repeated regularly, and the results provide empirical data that can be used to form the basis of improvement strategies. Key findings include:

1. Percentage of first-time online or blended learning students: The number of students identified as "first-time enrollees" to the online learning platform represented 70%. The other 30% had prior online or blended learning exposure.
2. Adequacy and quality of the online instruction: The average scores of satisfaction for Instructional services ranked at 90%. Students were satisfied that the classes met the learning objectives, the courses were easy to navigate, and they provided adequate auditory and visibility to accommodate all learning styles.
3. Final examinations: About 80% of student responders took a final exam through the virtual learning platform.
4. Faculty engagement: The satisfaction scores for teacher engagement ranged from 81% to 85%. The questions included levels of engagement, as well as faculty guidance.
5. Challenges faced: Students ranked the challenges faced as follows: the most challenging factor, the Internet, and the least challenging issue, the lack of computer equipment.
6. Overall satisfaction: The score for overall satisfaction included the student's likelihood to take another online course. The responses indicated 70% would like to take another online session, and the overall satisfaction score for the COVID-19 online learning experience came in at 85%.

In summary, the results indicated that students were mostly satisfied with the BTVI's response to the COVID closures and the instructional methodology was adequate. The area showing an area of concern related to technical and Internet challenges. Teacher engagement from the point of faculty guidance showed some average ratings. Overall the results were positive. It is anticipated that the results will be assessed in additional detail and used to improve the online experience. For example, based on these concerns, computer labs are now opened by appointment and students use these facilities using social distancing protocols. In addition, an introductory online course has been finalized that provides students with an understanding of how the online systems work. Finally, ongoing teacher training is underway to improve both course development and delivery.

## Community Support

BTVI has consistently attracted the support of key corporate and community stakeholders. One recent example is the Race for the Kids and the support of the Royal Bank. The funds generated by the RBC were specifically designed to assist the hurricane-impacted areas of the country and to provide a software system to enhance student retention. In addition, the Rotary Clubs of the Bahamas contributed laptops for the hurricane-impacted areas.

Another example is a partnership between the Commonwealth of Learning (COL) and BTVI in which the COL is sponsoring online education training for a number of BTVI faculty members.

Overall, these types of partnerships are critical, and it is anticipated that this support can be enhanced to build the brand particularly related to up-skilling the workforce in these very challenging post-COVID times. Firms and organizations both domestic and global are looking to partner to assist community development efforts. Finally, a skills gap survey was developed with the support of key stakeholders. The survey conducted in 2019 confirmed that 60% of employers suggested that prospective employees were not globally competitive. The survey results were designed to inform additional training opportunities throughout the country.

## Post-COVID Workplace Skills

A key consideration for any academic institution in today's environment is the need to assess the critical skills that will be in demand post-COVID.

The European Commission (2020) suggest that the critical post-COVID skills will include: leadership, particularly related to teams and working remotely; emotional intelligence to work with ourselves and others in uncertain and challenging times; technology skills will be increasingly "indispensable"; digital and coding skills to manage processes and data; adaptability and the ability to understand change and the ability to embrace change; creativity and innovation to continuously improve; data literacy to effectively gather and manage "big data"; and critical thinking to evaluate data and make informed decisions.

Of course, ensuring an effective educational system to achieve these objectives will not be an easy task. Indeed, a key challenge for educators is the budgetary constraints made more pressing by the global pandemic. The OECD (2020) suggests that "governments should not solely focus on the short-term effects of the more than two months of disrupted learning, which may fade out by the time students complete their school education. The policy focus should be set on keeping students engaged in learning to limit hysteresis, the long term impact on students' outcomes, which also potentially aggravates inequalities in education."

## Summary

In summary, there are a number of key initiatives that have been started at BTVI which are providing positive results. In particular, it is critical that skills are developed to address the dual national impacts of Hurricane Dorian and the COVID-19 pandemic. Projections indicate that there will likely be continued high unemployment as the pandemic is resolved. Strategic investment in skills development is timely and can pay significant dividends in the recovery phase of rebuilding the national economy. The specific outcomes that BTVI is aiming to achieve include:

Quality – it is critical that quality and national accreditation be advanced illustrating the vital focus on providing a global standard of excellence in all programs. This will strengthen relationships with international institutions as BTVI partners with firms in other countries that will facilitate acceptance of BTVI credits and programs.

Certifications – increase the percentage of graduates completing courses with industry-recognized certifications. This will increase employment opportunities as foreign direct investment and major developments take place throughout the country notably in the hurricane-impacted areas. Entrepreneurship will also be promoted/increased.

Accelerated Trade Courses – the model will move to shorter more focused courses and programs that will enhance retention, graduation, and output while maintaining quality. These courses will be employed focused on building employment skills including specific training in starting and operating a business. Entrepreneurship represents a key skill that will be advanced.

Online – use more technology to deliver online and or blended content to a broader range of Bahamians countrywide. Improving online course quality is a key goal.

Training Faculty – ensure that the faculty are properly trained to meet the demands of the new reality using primarily short, industry-recognized certifications.

Dual Enrollment – as a method to introduce younger Bahamians to the trades, develop stronger relationships with students and provide specific, primarily trade courses and programs for high school students.

Online Centre of Excellence – an online center that has been formally established. This center is designed to promote, support, and deliver online education. The center will solicit partnership support from other academic institutions, industry, NGOs, and the Government of the Bahamas.

Physical Infrastructure – the infrastructure to deliver high-quality programs must be enhanced as BTVI has for many years required facility improvements. This is also a requirement of some of the international certification and accreditation institutions. For example, the Freeport campus remains only partially

operational as a result of Hurricane Dorian damage. Major repairs are urgently required to make the facility useable as classes are being held at the local high school. In that respect, the capital budget is designed to repair the damaged buildings in Freeport and to bring Nassau facilities up to standards required to offer industry approved certificates and accredited courses.

In conclusion, BTVI made the pivot to online very quickly and efficiently. For example, moving courses to the learning management system was completed within 72 h. Also, developing and implementing a series of training initiatives that includes more than 11,000 h of professional development work by faculty and staff shows a strong commitment to continuous improvement during difficult times. Going forward, training priorities for the next year are being identified, and these include customer service, conflict resolution, and leadership. Student survey data from the initial lockdown are quite positive; however, ongoing surveys are important to develop a culture of continuous improvement. Finally, a focus on short, industry-certified courses in the trades using the NCCER model is imperative in addressing the skilled worker shortage in the Bahamas particularly driven by Hurricane Dorian. It will take a united effort over time to close the skills gap and rebuild the country.

# British Model of Local Government and Personnel Management

Intae Choi
Yonsei University, Seoul, South Korea

## Synonyms

Organizational setup; Organizational structure

## Definition

Local governments of the United Kingdom possess an organizational environment where local governments can autonomously regulate their activities rather than be intensively controlled by the central government. The central government

simply presents larger directions, leaving local councils to handle, change, and decide upon specific affairs appropriate to local circumstances.

## Introduction

General local governments in the UK are largely categorized as either upper tier or lower tier, also known as a two-tier local government system. The upper tier includes the Greater London Authority and County Council, while the lower tier includes the Borough Council, District Council, and City Council. There also exist unitary authorities, which include Metropolitan Districts. On the other hand, as part of the federal union, the Welsh and Scottish governments take on a unitary form of a single-tier system. In the UK, there are also sub-local governments where administrative authority does not exist. In certain parts of England, there are Parish Councils and Town Councils, and Community Councils exist within the Scottish and Welsh governments. In terms of administrative authority, the right and authority of taxation are not acknowledged in sublocal governments, and partial administrative functions may be delegated by district local governments for operation.

## Organizational Setup of the United Kingdom's Local Government

The UK's existing local government system has its foundation in the Local Government Act 2000. Because the main members of a local government's executive committee are local council members rather than public officials, the system makes it convenient for a local council to respond to its residents. Mayors are not given significant authority in UK's local governments. They are not granted the authority to make decisions, but are only responsible for conducting council meetings. The actual decision-making power lies within the local councils. The role of the council member, then, is significant because local councils make key decisions regarding regulation, planning, permission, schools, and staffing. Public officials of the executive committee only serve as consultants (Local Government Association 2011).

The authority to restructure a local government organization is given to the chief executive. This is stated in Part II Article 12 Section 3 of the Local Government Act 2000. In other words, the repeal of an existing local government organization or the establishment of a new organization is entrusted upon a chief executive's autonomy. A chief executive may adjust an organization to increase its administrative accountability through transparent and efficient operations that are suitable to local affairs. The local council approves the report submitted by the chief executive, and the organization establishment item gets proposed along with other agenda items. The local council systematically analyzes the proposal and prepares explanatory materials from an impartial point of view, which then gets reported to the Secretary of State for review. In fact, it becomes a decisive moment in the process when the local council approves the report submitted by the executive committee. Realistically, the operation budget is the main decisive factor that determines whether or not an organization can be established. According to local government cases in which chief executives submitted reports when local governments propose to restructure an organization, the main purpose is to increase operative efficiency with the expectation of a budget increase effect (Sarah Dennis 2011). On the one hand, the chief executive emphasizes that organizations should not peremptorily make decisions regarding organization structure, but should go through the process of discussing with chief administrative officials and strive for cost reduction effects (Stoke-on-Trent City Council 2014).

## Personnel Management of the United Kingdom's Local Government

The size of executive staffing that constitutes upper-level management in a self-governing body is limited to a maximum of 10 members by law. According to Part II Article 11 Section 8 of the Local Government Act 2000, no matter what

form a self-governing body takes, the total size including the mayor and committee executives cannot exceed 10 members. In other words, staffing regulations only exist for top executive officials, and all other government staffing below are carried out in a top-down manner suitable to the needs and state of affairs of each local government. With the exception of the top executive committee, all staffing matters are entrusted to the executive committee's autonomy. In other words, personnel management is carried out for an efficient administrative operation, and when personnel changes occur due to retired employees or new employees, internal audits are executed by the local council. The internal audit report is prepared by the chief executive (Argyll Bute Council 2009). Although the executive committee possesses autonomy for staffing, their decision-making process cannot be carried out independently. They must form a committee to gather officials' opinions and convince the local council (Newham Council 2013). Although the local government itself has the autonomy to configure its own staffing, it is not impossible for the central government to exert control. According to Part III Article 49 of the Local Government Act 2000, the Secretary of State, who is part of the central government, may regulate government officials of the local governments in England and Wales. The National Assembly for Wales can regulate government officials of its local governments. In order for the central government to exert control over local government officials, it must go through mutual consultation with the related committee, and in the absence of a committee, it must go through a consultation process with the appropriate person in charge.

Personnel expenses are the main influence factor of management for government staffing. Although local governments in the UK generally recruit based on the demand for administrative services, personnel expenses for government workers, which is a main budget expenditure, influences the staffing size (Department for Communities and Local Government: London 2014). Personnel expenses are considered important in UK's local governments because they are directly related to the pensions that government workers receive upon retirement. The breakdown of a government worker's personnel expense includes, wage, worker's insurance, annuity insurance, local allowance, education, and cost of recruitment (Department for Communities and Local Government: London 2014). Although local governments can autonomously recruit based on demand for administrative services and need, the most commonly recruited positions are teachers, police officers and police support, fire service workers, traffic management workers, and other general labor workers within the local government (Department for Communities and Local Government: London 2014). Considering such circumstances, a number of schools, police stations, public safety services, fire stations, etc. are indicators that are closely related to the personnel management and staff recruitment of UK's local governments.

## Conclusion

The local governments in the United Kingdom usually design their organizational structure autonomously. Though central government can control local governments' operations and structure, regulations on local government rarely take place. This is because the relationship between them is based on mutual trust. The local government in the United Kingdom can adjust their organizational structure and size at their discretion upon their budget size. It can be an adequate way to go forward to sound local autonomy.

# Budget Analysis

Maria Teresa Balaguer-Coll
Universitat Jaume I, Castellón, Spain

## Synonyms

Budget indicators; Revenue and expenditure analysis

## Definition

Budget analysis: involves examining and explaining the components of budget expenditure and revenue. The use of budget indicators (ratios) can help to improve understanding of issues such as the level of implementation of expenditure and revenue budgets or the structure of the budget. In the public sector, the main objective of budget analysis is to control expenditures and predict future budget needs, thereby providing decision makers with the information they need to prepare the budget for the next fiscal period.

The International Public Sector Accounting Standards Board (IPSASB) 2014 defines a number of basic concepts related to the budget, some of which are presented below:

- Approved budget: means the expenditure authority derived from laws, appropriation bills, government ordinances, and other decisions related to the anticipated revenue or receipts for the budgetary period.
- Original budget: is the initial approved budget for the budget period.
- Final budget: is the original budget, adjusted for all reserves, carry-over amounts, transfers, allocations, supplemental appropriations, and other authorized legislative or similar authority changes applicable to the budget period.

## Introduction

The budget plays a key role in the public sector, as it is an essential tool for financial management and control. Studying its composition provides information about important aspects such as forecasts and executions of revenue and expenditure. However, classification criteria are needed in order to analyze and compare the budgets in different countries. Various international organizations have introduced methods for this purpose, such as the International Monetary Fund's (IMF) system for classifying expenditures and revenues according to their economic and functional nature or the International Public Sector Accounting Standards Board's (IPSASB) International Public Sector Accounting Standards (IPSAS), an important tool in helping to prepare accounting reports.

The international financial crisis and the associated large fiscal deficits and rising debt levels in many countries have highlighted the importance of having access to comparable data at the international level for taking appropriate corrective action. In recognition of this need, the IMF published the third edition of the Government Finance Statistics Manual 2014 (GFSM 2014). This manual represents an important step forward in clarifying the rules for submitting fiscal statistics, thereby improving public sector information and transparency.

In addition, in light of the variations in accounting criteria and practices among public sector entities, the IPSASB considered it necessary to publish standards providing a basis for public sector entities; to standardize the criteria in financial, accounting, and auditing matters; and to increase both the quality and the comparability of financial information reported by public sector entities in different countries across the world. At the European Union (EU) level, the financial crisis has highlighted the importance of the European Public Sector Accounting Standards (EPSAS),

Europe's common accounting standards. These standards are based on the IPSAS, and their purpose is to promote greater fiscal and budgetary integration among member countries.

The main objective of this chapter is to present some fundamental aspects in public budget analysis. The chapter is structured in five sections. The first section defines the basic characteristics of budgets. The second section analyzes the economic and functional classifications of expenses and revenue budgets, in accordance with some generally accepted classifications (in particular the GFSM 2014). In the third section, taking into account the recommendations of the International Public Sector Accounting Standards Board (IPSASB), the differences between the approved budget and the executed budget are explored. Section four describes some basic indicators that can be drawn from the budget information. Finally, the main conclusions are presented.

## The Importance of the Budget in the Public Sector

Although numerous authors have written on the conceptualization of the budget, Anthony and Young's (2003) definition of the budget as "a plan expressed in quantitative, usually monetary terms" is particularly useful. Horngren et al. (2012) define the budget as "the quantitative expression of a proposed plan of action by management for a specified period and an aid to coordinating what needs to be done to implement that plan." Thus, public budgets can be said to have the following features:

- The budget activity is an act of foresight. The budget reflects expenses and revenues during a given period of time.
- It is produced at regular intervals (usually one year).
- It is based on quantitative balance between revenue and expenses, expressed in accounting language.
- It is an important planning and control instrument, which includes the forecasts and execution of expenditures and revenues. Thus, it shows the government's economic performance for a given period with marked targets and the resources required for its implementation.

## Budget Classifications

The budget is divided into revenue and expense budgets. The revenue budget can be further divided into two classifications: administrative and economic. The spending budget can have three classifications: administrative, economic, and functional. As well as these three classification systems, some countries use additional systems to provide complementary information (Jacobs et al. 2009):

- Classification by *geographical location* of the administrative unit, the taxpayer, or the recipient of government transfers and subsidies
- Classification of the *beneficiaries* of government transfers and subsidies
- Classification of the *sources of financing* and counterpart funds used for recording external loans and grants

A budget classification system provides a normative framework for public administration, the structure of which is based on the establishment of common aspects that help authorities make decisions at all stages of the budget process (planning, execution, and presentation of information). The classification of budgetary operations in terms of their economic, functional, administrative, and other characteristics is important for policy and performance analysis, allocating resources efficiently among sectors, ensuring compliance with the legislative authorizations and financial regulations, and the day-to-day administration of the budget (Tommasi 2013; Jacobs et al. 2009).

### Revenue Classifications

Revenue classifications are generally based on international standards. Revenue can be classified according to two systems:

- Administrative classification: informs which entity is responsible for entering the resource.
- Economic classification: identifies the type of revenue.

### Economic Classification of Revenue

The economic classification of revenue is based on the nature of income and distinguishes between current and capital revenue. Current revenue comprises direct and indirect taxes, fees for services, property income, and received current transfers. Capital revenue covers real investments and received capital transfers.

The IMF's Government Finance Statistics (GFS) provides an internationally accepted framework for economic classification of revenue. The framework from the 2014 GFS Manual is shown in Table 1.

### Expenditure Classifications

Expenditures can be classified according to various criteria:

- Administrative classification: identifies the entity responsible for managing the public funds concerned.
- Economic classification: identifies the type of expenditure incurred.
- Functional classification: organizes expenditure according to the purposes and objectives for which it is intended.

Source: GFSM (2014)

Through the Government Financial Statistics (GFS) system, the IMF establishes codes to facilitate comparisons between countries and assist in computing analytic measures for fiscal policy decisions. The reporting system prescribed by the IMF is a statistical system to measure fiscal performance. GFS classify the expenditure in two categories: functional and economic. However, some countries do not apply internationally recognized classification systems, and the classification categories may vary from one country to another.

### Economic Classification of Expenditure

The economic classification reports how the budget is spent, identifying the type of expenditure incurred (e.g., salaries, goods and services, transfers and interest payments, or capital spending). Budgets should distinguish between current and capital expenditure to improve transparency and political decision making.

Capital expenditures reflect public sector investment and include direct investment (infrastructure, buildings, equipment, and other long-lived assets) and capital transfers to other entities; current expenditures cover spending on maintaining and operating the services governments provide during the fiscal year and consumed in that period (e.g., salaries, goods and services, interest payments, current transfers). However, the distinction between current and capital expenditures may vary by country, as governments may establish an arbitrary cutoff point to distinguish between the two types.

The GFS establishes a classification for revenues based on the nature of expenditure, shown in Table 2.

### Functional Classification of Expenditure

The functional classification identifies spending according to its objectives. It gives information on how the money is spent (education, health, defense, social services, etc.). This classification

is especially useful in analyzing the allocation of resources among sectors.

One of the best-known classification systems is the classification of the functions of government (COFOG), developed by the OECD and defined by the United Nations Statistics Division. This system has been incorporated into the International Monetary Fund's Government Financial Statistics Manual (GFSM), which classifies government expenditure data from the System of National Accounts (SNA) according to the purpose for which the funds are used. The complete classification of the functions of government has three levels of detail: divisions (first level), groups (second level), and classes (third level). At the first level, the COFOG system divides spending into ten broad categories. Table 3 lists all the categories and subcategories.

Source: GFSM (2014)
Notes: *R&D* research and development, *n.e.c.* not elsewhere classified
(*)The GFSM classification incorporates the classification of the functions of government (COFOG) of the OECD and the UN

EU member states are required to provide Eurostat data for the ten COFOG categories. This data must include the cost of all public administrations so that flows between the different subsectors of general government, such as interest payments and transfers, should be consolidated to adequately reflect total public expenditure.

The IMF's Government Finance Statistics Manual (GFSM) provides a standard framework for developing a budget classification structure. However, as Jacobs et al. (2009) point out, the GFSM is generally not sufficient for the purposes of developing a budget classification system. It focuses on revenues and economic and functional reporting for statistical purposes, while a budget classification system is also an instrument of policy formulation, administration of the budget, and accounting. As a result, the classification system for both expenditures and revenues may need to be adapted to meet the needs of budget preparation and execution.

### Cross-Classification of Expenditure by Functional and Economic Classification

In the GFSM 2014, the IMF points out the usefulness to analysis of a cross-classification of functional classifications of expenditure (COFOG) with each of the categories of the economic classification of expenses (Table 4). The cross-classification allows analysis of the following:

- The inputs, which show how governments perform their functions, and the outputs, which reflect the products and services produced by a program or activity
- How governments carry out their public expenditure policy functions and the changes produced in the composition of expenditure over time to attend to specific policy objectives
- Comparison of how different governments perform certain functions

## Comparison of Approved Budget and Executed Budget

The International Public Sector Accounting Standards Board (IPSASB) publishes International Public Sector Accounting Standards (IPSAS) for use by public sector entities around the world in the preparation of their financial statements. The IPSAS 24 *Presentation of Budget Information in Financial Statements* establishes that public sector entities should present a comparison of the budget (approved) and actual amounts (executed budget) in financial statements that report information about (Table 5):

- The original and final budget amounts. The entity must "present an explanation of whether changes between the original and final budget are a consequence of reallocations within the budget, or of other factors."
- The actual amounts on a comparable basis. To enable comparisons, budget and actual

**Budget Analysis, Table 5** Statement of comparison of budget and actual amounts

| | Budget amounts (approved budget) | | Actual amounts (budget execution) (3) | [a]*Difference: final and actual budgets* (4) = (2–3) |
|---|---|---|---|---|
| | Original (1) | Final (2) | | |
| Revenues | | | | |
| Expenses | | | | |

Source: IPSASB (2014)
[a]The column difference is not required. However, a comparison between the actual and the final budgets may be included

amounts shall be "presented on the same accounting basis (accrual, cash, or other basis), same classification basis and for the same entities and same period as for the approved budget."

- The differences between budget amounts and actual amounts. The entity should present differences in additional columns appended to the budget or in an additional financial statement.

The comparison of the approved and the executed budgets informs users whether the resources were obtained according to forecasts and whether they were carried out according to the approved budget. Although all budgets need some flexibility to respond to unexpected circumstances, variations from the approved budget must be clearly reported because they can have significant economic and social impacts.

## Budget Indicators

This section shows some indicators that can be obtained from the information contained in the budget (Brusca and Condor 2001; Carcaba 2003).

## Budget Execution Indicators

These indicators analyze the extent to which the forecasts and final appropriations have led to settlement of receivables and recognition of payment obligations, how easily these receivables can be turned into cash, or the rate at which payments are made. They can be studied following the economic and/or the functional budget classification. Some of these indicators are:

- *Expenditure execution: total expenditures (executed)/total expenditure final estimates*.

This ratio reflects the proportion of appropriations approved in the period that have led to recognition of budget obligations. For a more in-depth analysis, it is useful to break down the budget implementation rate into its components, such as current expenditure and capital expenditure and, for greater detail, into levels such as expenditure on personnel, goods and services, etc. This indicator provides information on the executed budget as compared to the approved budget and is therefore a useful reference with which to appraise future budgets.

A further possibility is to analyze the level of execution of the expenditure budget in light of its functional classification; this analysis would reveal the extent of execution in approved budgets for defense, health, or education, for example.

- *Revenue execution: total revenues (executed)/total revenue final forecasts*.

This ratio reflects the extent to which approved (forecast) budget revenues give rise to net budget revenues, that is, the degree to which they were executed. Starting with the economic classification of the budget, as with the previous indicator, it would also be of interest to break down the execution rate for revenue budgets into current revenue and capital revenue and even at a greater level of detail, such as taxes, transfers from other government subsectors, etc.

- *Payment execution: total payments/total expenditures executed (net recognized obligations)*.

This ratio shows the expenditure payment arrears, in other words the proportion of obligations recognized in the period that were paid

by the end of that period in relation to total recognized obligations.

- *Receivable execution: net receipts/total revenues executed (net recognized revenue*).

  This ratio shows the percentage referring to receivables obtained in the period over net recognized revenues; it therefore measures an entity's capacity to turn into cash sums due to be collected.

### Indicators of the Budget Structure

- *Percentage of current expenditure: current expenditures executed/total expenditures executed (net recognized obligations*).

  This ratio measures the percentage of total expenditure represented by current expenditure (salaries, goods and services, current transfers, and interest payments).

- *Percentage of capital expenditure: capital expenditures executed/total expenditures executed (net recognized obligations*).

  This ratio reflects the entity's investment strength. It establishes the proportion of total budget spending represented by capital operations in the period.

- *Fiscal capacity: own fiscal capacity (taxation revenues)/total revenues*.

  This reflects the proportion of total budget revenues collected during the period represented by budget revenues from taxation.

## Conclusions

Today's economy demands increasing analysis and transparency in public budgets, which are essential documents for studying government policies and commitments, involving decisions that determine how resources are obtained and what will be spent. However, well-defined budget classifications are needed to analyze the budgets of various public institutions at a particular time or across time (of the same country or among countries). The IMF's Government Finance Statistics (GFS) represent an important step in this direction, as they provide an internationally accepted framework for developing a budget classification structure.

Another important tool to help develop accounting reports is the IPSASB, through the development of International Public Sector Accounting Standards (IPSAS). Specifically, the IPSAS 24 *Presentation of Budget Information in Financial Statements* establishes a series of definitions and bases for presenting public budgets designed to improve the quality and comparability of information contained in countries' public budgets across the world. The IPSAS 24 establishes that public sector entities must present a comparison between the budget (approved) and actual amounts (executed budget), informing users whether resources were obtained in accordance with their provisions and whether they were carried out in accordance with the approved budget. The use of budget indicators (ratios) can help to improve understanding of issues such as the level of implementation of the expenditure and revenue budgets.

# Budget Approval and the Legislative Process

Igor Khodachek
Nord University Business School, Bodø, Norway

## Synonyms

Budget adoption; Budget process; Legalization of budget projections

## Definition

The budget approval is a process when annual estimates of public revenues and expenditure made by governments (executive branch of power) acquire a status of a legal act after discussion and voting in parliaments (or similar elected institutions).

## Introduction

Historically, the French revolution (1789–1799), which gave the power to authorize budgets to the legislative body, is seen as a starting point for public budgeting (Bergmann 2009: 45). The process of developing and approving the annual budget remains to stay among the most important activities undertaken by governments and politicians in parliaments.

Budgeting is always about making the best use of limited amount of resources; hence, it is about making complicated decisions. A probably good metaphor for the budgeting process is a store shelf where goods with price labels represent competing policy alternatives (Wildavsky and Caiden 2004). The often-implied controversy of trust/mistrust between the public and the government on the spending of money collected in the *bougette* (old French word for a small leather bag used for carrying money) drives the demand for an ideal procedure of allocating these scarce resources. This is where the rational economic ideas of efficiency and effectiveness practically come from. Thus, the elected politicians are expected to support the decisions that promise to implement the chosen policy in a most efficient and effective way, or it may be said, the most rational way. However, the rationality of political decisions may be questioned due to the human factor behind them, which is an inevitable feature of the democratic governance that in turn has a dialectical nature of competition and consensus.

This entry presents the topic of budget approval and the legislative process in the following way. First, the idea of incrementalism as one of the ways of addressing the political nature of budget is presented. Second, the entry discusses budget approval in New Public Management (NPM). The third part discusses about budget approval in a globalized world, reflecting on the analysis of multiple countries and the examples of best practices derived from it. The fourth part presents the concrete illustrations from three different contexts: the United States of America, the Russian Federation, and the People's Republic of China. The fifth part concludes the entry, summarizing its key points.

## Politics of the Budgetary Process and Incrementalism

The political dimension in the analysis of the relationships around budget approval dominated the recent academic debate in the West while trying to answer the core question: "On what basis shall it be decided to allocate x dollars to

activity A instead of activity B?" (Key 1940: 1137). Politics is a struggle between various interest groups over a limited amount of resources. However, these interest groups should always come to a consensus in a certain point of time. Otherwise the work of the government will stop. Reflecting on the ideas of complexity and the compromise nature of political decisions, the concept of incremental budgeting, proposed by Wildavsky (2004), suggests the decision to finance the program (or the activity) on bases of how much it received in the previous period, adding a small increment to satisfy the supporters of the program. The approved amount of the increment reflects the performance of the supporters in the political game around budget. Although the incrementalism had later proven to be irrelevant to address the factual major "automatic" increase in the US budgetary spending on healthcare programs in the 1970s, it used to be a powerful all-encompassing framework that not only described but also prescribed how budget approval should be done. The incrementalism theory remains useful for scholars and practitioners interested in how budgetary politics affects the work of government and policy decisions (Kettl in Wildavsky and Caiden 2004).

## Budget Approval and NPM

The reemergence of rationality in the normative models of budget decision-making after incrementalism is associated with the 1980s' turn to managerialism in the public sector (also known as NPM). The NPM framework focuses on performance, decentralization, and businesslike practices (Hood 2001). Together with the financial and economic projections, budgets include long-term strategic goals, instruments to achieve them, and performance indicators. Along with some neoliberal economic implications like the reduction of the state and eliminating the distinctions between public entities and private companies, NPM brings the organizational perspective into budget approval. Budget is seen as a prospective plan of activities of an organization (a government), authorized shortly before the commencing of the period it refers to. The focus in budget approval shifts from the issues of power and politics to the instruments of rational planning of public resources. A public sector manager's role is to balance the current expenditure and investments with revenue and borrowings and get the authorization (approval) by the highest level of governance, which may or may not include elected politicians (Bandy 2011). The form of approval may vary, but as a generally accepted principle, this is done through legalizing annual budgets in the form of a law.

## Budget Approval in a Globalized World

Due to the diversity and uniqueness of each country's path toward their current state, the generalizations presented above should be made with great accuracy. However, they can be helpful to analyze the trends and understand the current discourses both in politics and in research, regarding budgeting. One of such discourses that have implications for the conceptual understanding of the budget approval is a debate on globalization. At the core, there lies a question of whether it is possible to develop "one-size-fits-all" universal prescriptions for every country disregarding historical and geographical implications or this is irrelevant due to distinctiveness and specificity of local contexts. While the turn to global convergence and standardization in economics adds legitimacy to the harmonization of government activities, such as International Public Sector Accounting Standards (IPSAS), which are based on International Financial Reporting Standards (IFRS) for corporations, this entry suggests that to get the holistic understanding of the essence of budget approval and legislative process, it is important to analyze and compare diverse national cases. The conclusions based on the comparative analysis of large sets of countries, thus, present a more reliable source of knowledge than general theories, derived from single case studies. Since cross-country studies are expensive and require multiple language and contextual expertise, they are often supported by global institutions such as the World Bank (WB), the

International Monetary Fund (IMF), and the Organization for Economic Co-operation and Development (OECD). In this section, the entry addresses the IMF Technical Notes and Manuals series and *The International Handbook of Public Financial Management* that suggest the following overview of good practices for budget legislation in the OECD member countries.

## Good Practices on the Role of the Legislature in the Budget Process

Parliaments become more actively engaged in budget matters (Posner and Park 2007). There are many parliamentary arrangements conditioning the budget process. These are parliament structure (one house or bicameral), number of political parties, electoral cycles, coordination among parliamentary committees, coalitions between politicians in the parliament and executives, etc. Budget discussions in parliaments and parliamentary oversight are important elements in democratic governance. The elected representatives formulate and approve policies and programs, making them closer to public's needs. In opposite, when executives dominate the decision-making, the budget may represent the wishes of unelected elites. Active involvement of legislature in the budget process leads to more transparent budgeting and enhances overall governance, but at the same time, it creates discipline risks – in those countries where parliaments have more authority over the executives, the legislature tends to increase spending and reduce taxes, which may misbalance the budget systems (Lienert 2010). In addition, politicians due to their nature tend to fall into short-termism and populism. All these may lead to increase of public debt that becomes a burden for future generations.

### Budget Process Activities

Most of the budgets represent annual fiscal plans. The annual budget cycle embraces several activities (Lienert 2010):

- Pre-budget discussions
- Reviews and debates of the government's draft budget that presuppose authorization of budget spending and approval of the revenue estimates
- Approval of supplementary budgets
- Review of budget execution

During pre-budget discussions that usually happen in the middle of the year, the executive presents their estimations, which should inform the parliament about annual and midterm budget strategy and policy priorities for the following year. At this stage, the executive gets the spending ceilings for a detailed budget proposal approved by the parliament. The approval process usually starts from 2 to 4 months prior to the coming year when the executive proposes detailed budget estimations and ends in December or in the beginning of the new fiscal year. The members of the European Union (EU) also send national budget for endorsement at the supranational level, which extends the approval time comparing to non-EU countries. If the parliament does not approve the proposal, in order the keep the budget programs running, the executive authorizes reversionary budget that allows monthly spending calculated as 1/12 of the previous year's budget with some seasonal adjustments. Some countries (Finland, Germany, and Japan) base reversionary budgets on the proposed budget. Supplementary budgets emerge when policy or macroeconomic circumstances change within the coming year after the approval. In addition, the need for supplementary budgets arises in case of natural disasters, crises, and price shocks that create unexpected demands of public funds (Lienert 2016b).

### What Is Approved?

Besides authorizing the appropriations of annual spending and new borrowing, the legislature reviews, endorses, and approves the following items, ideally together with the annual budget (Lienert 2016b):

- The macroeconomic framework, which may include the prices on key commodities, currency rates, estimates of the world's, and national economic growth
- Revenue projections, including the methodology and the assumptions

- Revenue policies that include the annual tax framework and/or permanent rules, for example, how the oil revenues should be distributed between the budget and extrabudgetary funds
- Medium-term budget framework and spending ceilings, which enhances the sustainability of the future budgets and aimed at preventing short-termism
- Strategies to manage public debt, including the sources of new borrowings and managing existing debts considering the conditions on the capital markets – often coordinated with medium-term framework
- Extrabudgetary funds and spending, which can be of public or mixed nature

### Budget Process Institutions

Ministries and agencies constitute the structure of a government. However, parliaments too need their structures that provide support to the legislative process, including approving the budget and the budget reporting. These structures are parliamentary committees, external audit offices, and parliamentary budget offices, whose work also requires appropriate funding, which is usually provided independently from the government. Parliamentary committees make recommendations on the distribution of budget spending among various policy areas and provide information for decision-making on the budget by parliament's plenary sessions. In one-party governments, the parliamentary committees are usually weaker than in coalition governments. There are sectoral and budget committees. The distribution of responsibilities between them varies from country to country and usually presupposes that the budget committee is responsible for the oversight of the overall budget, while sectoral committees oversee the implementation of specific budget policies. External audit offices (namely, Court of Accounts, General Audit Office, Chamber of Accounts) provide annual audit of the government's accounts, allowing parliaments to oversee the budget execution. External audit reports are often discussed by the budget committee. Parliamentary budget offices are usually technical units and nonpartisan, which means that they do not belong to any of the parties. They produce independent and sometimes alternative fiscal projections and assess the impact of new tax and spending policies that may differ from those provided by the governments (Lienert 2016b).

B

## Good Practices of the Legal Framework for the Budget Process

Public governance is performed on the legal basis. The legal framework regulating the budget approval and legislative process usually is threefold and consists of the constitution, a budget system law(s) (BSL), and government (ministerial) acts.

### Constitutions

Constitutions describe the general roles of the legislature and its relationship with the executive and may prescribe the supremacy of the parliament over the executive, which is often limited to the formal approval of revenues and expenditures of the annual budget law drafted by the government. Generally, the constitution provides the framework for all laws, and some budget provisions may be included in it. This refers to the division of general responsibilities of the power branches (executives and parliaments), relations between federal and regional or central and local government, general principles of the budget system, and sometimes the prerequisites for the external audit body. The constitution may also state the debt-GDP ratio, balances between the central and regional budgets in federal states, and requirement for overall budget balance (relevant for both unitary and federal states).

### Budget System Laws

The rules for formulating, executing, and reporting on the annual budget are usually specified in a BSL or in a set of laws that provides guidance for budget process and defines the roles of executives and parliamentarians in this process. The BSL may have a status of an ordinary law or it may have a special higher-ranked, so-called organic law, as it is the case of France. The BSL creates a general framework (e.g., broad principles) leaving the detailed rules and regulation for the executive branch. BSLs are usually more stable than other regulations and do not include

issues that tend to change frequently. The BSL reflects the specificity of administrative, cultural, and structural features of the country, e.g., the federal/unitary state, presidential/parliamentary systems, bicameral/unicameral parliament, and sometimes the peculiarities of political tradition like the number of parties usually involved in policy making. It also reflects the balance of power between the legislature and the executive – parliaments are usually in the supreme position: the BSL requires that all taxation and all expenditures should be based on law, which implies that all revenues can be spent only after the approval of the legislature (the BSL also specifies exceptions from this rule). The BSL specifies the accountability of the executives to the legislature: the executive's main responsibilities are to submit a draft budget law to the legislature and report on its implementation. Accountability within the executive branch is usually regulated by internal ministerial or government decrees and may not be specified in the BSL. The key steps in the budget process stated above are also specified in the BSL. The extent to which further and more detailed steps are covered by the BSL varies throughout the countries, but usually if the legislature has very strong power in the budget process, it puts legal constraints on the executive's ability to maneuver the budget execution. The following areas are specified in the BSL rather than in subsidiary regulation (Lienert 2016a):

- Submission of annual budget or appropriation laws to the legislature. The BSL specifies the date by which the executive submits the draft of the annual budget to the legislature, budget principles (e.g., annuity and balance), budget rules (like those regulating oil revenues), and classification of budget appropriations – line items or a degree to which expenditures need to be disaggregated (programs, economic and functional classifications).
- Documents to accompany the annual draft budget law. These are midterm macroeconomic and fiscal projections, budget assumptions, budget implications of extrabudgetary funds, and performance information (objectives and targets).
- Adoption of the budget by the legislature, including amendments and procedures.

The practical value of the above-presented good practices and possible generalizations derived from them are uncertain because of contextual specificities of analyzed cases. Nevertheless, they are helpful for comparative analysis and may serve as a point of reference for understanding single country examples.

## Country Examples

### The United States of America

The United States is a federal republic with strong parliamentary democratic traditions. As a major economy, the United States plays a decisive role in global governance institutions, such as IMF and WB. The budget process in the United States is outlined in The Budget and Accounting Act that has been adopted in 1921. Its official title is "Budget and Accounting Act, 1921" (Budget Act 1921), but it is usually referred to as the Budget Act. Beside the Budget Act, the budget process regulation includes the rules of the House and Senate and other relevant legal acts. The budget process in the United States comprises five stages: Stage 1 – President's budget submission; Stage 2 – adoption of the budget resolution; Stage 3 – passage of appropriation bills; Stage 4 – consideration of reconciliation legislation; Stage 5 – consideration of authorization legislation (Committee on the Budget 2016).

On stage 1, which commences on or before the first Monday of February, the President submits a comprehensive budget request to the Congress. It outlines the Administration's policy and funding priorities and the economic outlook for the coming fiscal year, which begins in the 1st of October. On stage 2, on or before 15th of February, the Congressional Budget Office submits the budget report to the budget committees. House and Senate Committees hold hearings on the President's

budget. Not later than 6 weeks after the President submits the budget, the committees submit views and estimates to budget committees. On or before 1st of April, the budget committees report a concurrent resolution on the budget that sets each committee's allocation of spending authority for the next fiscal year and aggregate spending and revenue levels for at least 5 years. The resolution is adopted on or before 15th of April. It is not signed by the President and therefore does not become a law. The resolution also establishes aggregate totals with respect to revenues and spending for the entire federal budget. The allocations, enforceable through points of order, establish the framework to consider spending and revenue bills in the House of Representatives and Senate. On stage 3, on or before 15th of May, the House of Representatives begins consideration of the 12 annual appropriation bills for the next fiscal year based on the discretionary spending allocation in the budget resolution. As these bills move through hearings, markups, parliament's consideration, and conference, they are constrained by the levels and allocations in the budget resolution and the enforcement of the Budget Act, as well as through House of Representative and Senate rules. The House of Representatives Appropriations Committee reports the last annual appropriation bill by 10th of June. On stage 4, if the spending and revenue levels in the budget resolution require changes in existing law, the resolution would contain instructions to committees to report legislation containing such statutory changes. By June 15th, the Congress completes action on reconciliation legislation (if required by the budget resolution). The House of Representatives completes action on annual appropriation bills on or before 30th of June. On the stage 5, the Congress considers numerous measures authorizing the appropriation of funds on many programs each fiscal year (Committee on the Budget 2016).

### The Russian Federation

Russia is a federal state with three levels of budget system – federal, sub-federal (regional), and municipal (local). Russia is a successor of the Soviet Union – a socialist state that used administrative planning to govern national economy. After the collapse of the USSR in 1991, the Russian Federation performed rapid reforms in economic, social, and political spheres. Although there are many sediments of Soviet legacy, today Russia is a presidential republic with market economy and core democratic institutions, such as two-chamber parliament – Federal Assembly – where the Council of the Federation is the higher chamber and State Duma is the lower chamber. The budget plays an important role in socioeconomic development since the state controls up to 70% of the country's gross domestic product (FAS 2016).

The Constitution of the Russian Federation states that federal budget, federal taxes, and federal expenditures should be legalized in the form of federal laws. The Constitution defines the responsibility of the federal government to prepare and submit budget projections to the State Duma.

The Budget Code of the Russian Federation is a collection of federal laws governing issues related to federal, regional, and local budgets. It states key fundamental issues of budget legislation, describes the country's budget system, and regulates the budget process: participants and their competence, preparation of budget projections, hearings and approval, and budget execution and control. Given that Russia is a federal state, the Budget Code also prescribes how subfederal legislation and municipal legal acts should look like regarding the budget process at regional and local levels.

The federal government introduces budget projections to State Duma in the 1st of October at the latest. The projections reflect the issues the President raises in his annual address to the Federal Assembly. Besides, they consider long-term (12 years) and midterm (6 years) strategic planning documents, such as the strategy of socioeconomic development and the strategy of national security; budget, macroeconomic, and technological forecasts; as well as state and municipal programs. The budget is approved for the coming

year and the planning period of the 2 years after it, thus creating a 3-year budget framework.

Within 10 days after the State Duma receives the budget projections, parliamentary committees submit their assessment to the budget committee. During the assessment, the committees invite executives and auditors from the Chamber of Accounts of the Russian Federation who give their perspectives on the projections. The budget committee produces the overall assessment and prepares the first hearing (Budget Code 2016).

During the first hearing, the government members, the budget committee, and the auditors of the Chamber of Accounts provide their perspectives on key budget parameters. The legislature approves the overall revenue (with oil and gas revenue projected separately) and expenditure, the inter-budgetary distribution ratios, the state debt level, the size of the reserve fund, and the level of budget deficit. During the first hearing, the members of Duma cannot increase the revenue and the deficit level without support of the government – they either approve or reject the projections.

In the second hearing, the members of Duma discuss the draft of the law – the text and the applications – which include programs, lists of receivers of budget funds, sources for deficit coverage, and other information. Institutions and organizations that possess the right of legislative initiative (President of Russia, federal as regional governments, higher chamber of federal parliament, members of lower chamber of federal parliament, regional parliaments, and Constitutional and Supreme courts – Constitution 2016) submit their amendments to the budget committee, which summarizes them and submits to the parliamentary committees and the federal government within 10 days. The approval of the amendments is governed by parliamentary acts. The Constitution states that all amendments that concern taxation or other issues that may increase the budget expenditure are considered only after receiving the federal government's opinion.

In the third hearing the draft of budget law is approved as a whole, together with all applications. Within 5 days after the third hearing, the budget is transferred to the Council of the Federation, which has 14 days for its approval or rejection. Within 5 days after the approval by the Council of the Federation, the budget projections are transferred to the President for signature and publication.

### The People's Republic of China

Like the Russian Federation, the People's Republic of China has socialist background, and today the Communist Party of China continues governing the country. According to the Constitution, all power in the republic belongs to the Chinese people and is exercised through a national congress and several subnational congresses. The Chinese National Congress elects the president, and the State Council is the highest executive organ.

The Budget Law was adopted in 1994 and received major revision in 2015. The revision introduced "full-scope" budgeting that includes a general public budget, a budget for government funds, a budget for state-owned capital operations, and a budget for the social security fund. The adoption of the Budget Law in 1994 was a major step toward opening government finances to the public, which used to be treated as private matter before that. However, the law still secured the domination of the executive branch over the budget process. The 2015 revision shifts this balance to the legislature (Xu and Yang 2015).

China is a unitary state with provinces, autonomous regions, centrally governed municipalities, and special administrative districts. The Budget Law describes five levels of budget system: the Central Government; the provinces, autonomous regions, and municipalities directly under the Central Government; the cities divided into districts and autonomous prefectures; the counties, autonomous counties, cities not divided into districts, and municipal districts; and the townships, nationality townships, and towns (Budget Law 2016).

According to China's Budget Law, the annual budget cycle includes four stages: formulation,

approval, execution, and auditing. The law says that a budgetary year begins on January 1 and ends on December 31, according to the Gregorian calendar (Budget Law 2016). However due to flexibility of congressional session schedule, a typical fiscal year starts in March after the Chinese New Year. The set of participants of the budget process is typical to other countries with the important role of the Communist Party, which, however, is not specified in the Budget Law.

The central budget and the budgets of local governments at various levels shall be compiled with reference to the actual implementation of the previous year's budget and to the estimation of the current year's revenues and expenditures. The public budget of the Central Government should not contain deficit. The concrete matters relating to the compilation of draft budgets shall be arranged by the financial department under the State Council. One month before the annual session of the National People's Congress, the financial department under the State Council submits the main contents of the draft central budget to the Financial and Economic Committee of the National People's Congress for preliminary examination. When the National People's Congress is in session, the State Council makes a report to the Congress on the drafts of central and local budgets. The central budget is examined and approved by the National People's Congress (Budget Law 2016).

## Conclusion

The budget approval and legislative process are important elements in democratic governance. However, in order to keep the revenue and expenditure balanced, strong parliaments require advanced legal framework constructed at the highest levels of public governance, such as constitutions and budget laws.

The good practices, developed at the global scale, suggest that the budget process requires supporting institutions, such as parliamentary committees and budget offices. Since budgets implement policies and programs, there is a demand for performance information, bringing in so-called performance budgeting. At the same time, since budget revenues in the most cases are predominantly collected from taxes, budget projections include macroeconomic forecasts and other relevant information. The approval of budget projections is usually done within several stages when the legislature, with the help of the support institutions and the responsible executives, analyzes and discusses the overall adequacy of the budget, redistribution policies, development programs, and – most often nowadays – the debt service issues. When approved and signed by the country's leader, budget projections become a law. As each law, budget presupposes sanctions for its violation, but for the purposes of flexibility, the budget may be revised within the fiscal year.

The concrete examples show that there are indeed many common features in very different countries. First, it is the highest position of budget approval regulation in the hierarchy of legislation, namely, constitutions and budget system laws. Second, there are clear stages in the budget approval process through which the financial projections prepared by the executive branch of power become legal acts. Third, as any legal act, budgets require both professional expertise and legitimacy. Budget institutions, such as parliamentary and budget committees, provide the expertise, while the elected politicians, whose role in the budget approval becomes more and more important, provide the legitimacy.

# Budget Cycle

Yu Shi
Department of Public Administration, University of North Texas, Denton, TX, USA

## Synonyms

Accounting and auditing; Budget cycle; Budget preparation; Executive implementation; Legislative approval

## Definition

The budgeting cycle involves a system of checks and balances between both the executive and legislative branches of the governments (Bland 2013).

## Introduction

In terms of budgeting within governmental entities, the one aspect of budgeting that is almost identical among all institutes is the budget cycle. By definition, the budgeting cycle involves a system of checks and balances between both the executive and legislative branches of the governments (Bland 2013), the executive branch who proposes expenditures and the legislative branch who empowers the executive branch to enter into these financial commitments (Bland 2013). The cycle requires the council verifying the executive's compliance with the proposed obligations.

While there might be some slight differences at each phase of the budget cycle between different jurisdictions and levels of governments, most budget cycles can be characterized by the acronym PLEA which includes preparation, legislative approval, executive implementation, and accounting and auditing (Bland 2013). Such a four-phased cycle is almost universal among

state and local governments in the United States regardless of the size or the institutional location (Bland 2013). Each phase comes with its own array of decision-makers, financial documents, and management process. Each phase also serves its own unique purpose in the budget cycle from priority identification to financial control to civic engagement and financial transparency.

This essay in the *Global Encyclopedia of Public Administration, Public Policy, and Governance* has three goals. First, it aims to introduce four phases in the budget cycle which is nearly universal life of a budget from preparation, approval, and implementation to evaluation for state and local governments in the United States. Second, it discusses major actors, key events, financial products, and additional details about the budget process used by state and local governments. By pursuing these goals, this essay aims to help practitioners who are interested in the governmental budgeting to understand the budget cycle of state and local governments.

## Budget Preparation

The first phase of the budget cycle is preparation. It typically occurs 3–6 months prior to the beginning of the new fiscal year. Those who actively involved in this phase of the cycle are the budget directors and analysts in the budget office, the chief executive, and the department heads. This phase generally starts with a budget "call" which consists of the chief executive's budget priorities; possible fiscal, institutional, and legal constraints for budget requests; and a set of detailed instructions on how to prepare their budgets. The budget office prepares two major items, including the budget timetable and the budget manual. The budget timetable sets out the dates for budget request submission, or public hearings, while the budget manual provides detailed instructions to each agency or department about how to prepare and submit budget requests, how to estimate program revenues, and what to expect as far as budget targets are concerned. The budget manual may also include contextual information about the upcoming budget process, such as information about upcoming events that may affect revenues or expenditure and specific council priorities or goals that agencies should focus on in their budget requests. After these budget timeline and budget manual are completed, the budget director will host certain budget kickoff events. In these events, budget directors, department heads, or any other personnel would gather in a room and discuss the budget priorities and process. This is also typically where the budget call is distributed.

During this phase, budget analysts in the budget offices have the administrative responsibility of preparing and updating revenue projections based on major revenue sources. Revenue forecasting can be considered the most important task in the phase of budget preparation (Bland 2013) because most state and local governments have some types of balanced budget requirements in the law. Determining available revenues for the coming fiscal year is important for budget deliberations as it will address the resources available to be spent and possible actions required to be taken. For example, if expected revenues will be less than what was budgeted for, the governing board may look for measures to cut service and reduce expenditures. If revenues rise, on the other hand, the board may look for ways to cut tax or to increase expenditure moderately. While budget analysts are responsible for revenue projections, the chief executive has a key responsibility in brining integrity to revenue forecasts and discouraging their manipulation to ensure financial accuracy in the budget process (Bland 2013).

After identifying budget priorities and receiving budget instructions in the kickoff events, all agencies or departments need to develop and formulate their budget requests. The greatest time has been spent in this part. Agency or department needs to provide sufficient justification for each budget request and link their requests to priorities and goals so that they have a better chance at getting their requests approved. The budget office

also requests that department heads provide as much information as possible, because this can ease the processing speed in the subsequent budget reviewing process.

The budget office will conduct a rough review of the department budget requests after receiving them. This round of review can be conducted quickly because budget analysts are looking for major changes or issues that can be immediately address. For example, these issues can be major increase in full-time equivalents employees, major reduction in programmatic revenues, or potential additions to capital improvement plans. After dealing with these issues, a detailed review will be conducted by the budget office. This round of review may include close interactions between the budget office and each department because the budget office needs to collect more information to gain a better understanding of exactly what each department requests and why they need it. The budget office works with the department in multiple approaches to develop realistic expectations for upcoming fiscal years. These communication approaches can be informal or formal public hearings, face-to-face meetings, and field visits. All these communications are used to ensure that the appropriate amount of resources is allocated to provide adequate services to local residents. After settling down any major disputes, the budget office compiles all requests into the executive budget which represents the chief executive's proposed spending plans for the coming fiscal year. This single document may be posted on web for financial transparency or circulated internally for departments to review, but more importantly it should be delivered to the council and prepare for the next phase which is legislative approval.

## Legislative Approval

This phase – legislative approval – typically occurs 2–3 months before the fiscal year begins and does not have a general pattern, as it varies by state and local governments. Most of the work in this phase is done by the council or through committees, with guidance from the budget directors or city managers. The council begins with an initial review of the budget document whose purpose is to ensure that the proposed budget is balanced (i.e., revenues are equal to or more than expenditures). Following the initial review, the council engages in formal budget work sessions, which are where the budget director and the chief executive go over the budget line by line with the council to ensure that they know what enhancements are being submitted and what programs are being changed.

This phase requires much input from the council because they may request amendments based on conversations or discussions during the work sessions. In small governments, these work sessions may take place during regularly scheduled council work sessions, while it is possible for large governments to have a designated budget work session which covers over 2 to 3 days. Council members may also have areas of special interests and may devote much time to these areas than others to ensure they understand the impact of these proposed changes. It is common to see most conversations will center around activities or services that are funded by taxes. For example, the legislature will enact the property tax rate when it appropriates the budget because the property tax is one of the most important revenue sources for local governments. Councils may devote less time to budgets for proprietary activities, for example, utilities and government-sponsored enterprises unless it has a significant fee increase.

Following the review of the chief executive's proposed budget, the legislature adopts the budget into the law by passing an appropriation. The appropriation is a legal act that binds the departments, legislature, and juridical branch into a spending limit for the upcoming fiscal year. Some state and local governments hold public hearings about the proposed budget before its adoption. These public hearings are open to the public and are legally required to be posted publicly a few weeks before the occurrence which gives citizens some time to review the documents and prepare for questions or comments. Generally, there is at least one public hearing specifically for the budget and one specifically for the proposed tax rate. After the

public hearings, the council votes to adopt the budget via a budget appropriation bill.

## Executive Implementation

The third phase, executive implementation, occurs at the beginning of the fiscal year and typically involves the department heads and the budget office. Along with the fourth phase of the budget cycle (including financial management, accounting, and auditing), executive implementation is one of three pillars of financial control (Bland 2013). There are several tasks in this phase. The first task in executive implementation is to communicate budget information to various actors, including citizens, creditors, state, and federal grantors by posting budget documents on government websites or conducting public hearings.

The second task is to maintain budget compliance by designing some procedures. Nearly all local governments use encumbrances, which occurs when a request for the purchase of goods or services is approved and forwarded to an outside vendor (Bland 2013). It thus serves as a temporary hold on a portion of a department's budget authority. Budget offices also approve the creation of new positions and reapproval of existing positions. Two of the oldest forms of budget control include apportionment and allotment. According to the US Government Accountability Office (GAO), apportionment divides appropriations into specific time periods, while allotment is the distribution of budget authority among the subunits of an agency. These two controls help keep the department accountable to the appropriation bill that was enacted during the legislative phase.

While it is important to maintain budget compliance, it is also necessary to take corrective actions once a problem has been identified in the implementation process. In this case, budget authority can be altered to realign the budget with actual amounts of revenues and expenditures. One common approach used by local governments is to shift budget authority between departments or the funds used to track transactions (Bland 2013). If there is an unexpected rapid drop in revenues and the budget cannot be balanced by spending, the managers may take impoundment-like measures by imposing a spending freeze, such as delaying large purchases or restricting travel. Due to the changes in the external political or economic conditions, the council's budget may be amended during the fiscal year. A supplemental appropriation will be created to provide additional budget authority during the current fiscal year for unexpected events such as natural disaster. To respond to fiscal crises, budget reserves (or called rainy day fund) may assist with budget authority adjustment with appropriation by the council, or a number of budget balancing strategies can be used to mitigate a budget shortfall and return the budget to a balance.

Although these corrective actions are taken to deal with unforeseen events and to help the governments to enforce financial control, Schick (1964) argues that an emphasis on such detailed controls may lead to a large amount of paper work which reduces the efficiency of government agencies and limits the flexibility of public managers to adjust to changing circumstances.

## Accounting and Auditing

In addition to executive implementation, accounting and auditing are two of the three pillars that provide financial control at the local level. Some key participants in this phase are the comptroller's office, the budget office, and the external auditors. The accounting and auditing phase assists with holding those involved in the budget process accountable through means of financial monitoring to maintain a balanced budget.

While the budget document is the financial planning document for state and local governments, the accounting framework provides sufficient financial information regarding revenues, expenditure, and net position. These information can be used for evaluating governments' financial condition and for identifying trouble spots –

where the spending is out of control or where the revenues lag behind budgeted expectations (Bland 2013). These information can be found in a major product of accounting/auditing which is the annual financial report, or called the Comprehensive Annual Financial Report (CAFR). It aggregates all the financial information for operations and reports on the financial position of state and local governments.

About 2–3 months after the close of the fiscal year, the comptroller collects and processes financial information and prepares the financial document; the council or commission then retains an external auditing firm to verify the accuracy of the fund balance reported in the financial document, the local governments' compliance with state and local laws and internal policies, and the integrity of the government's financial control (Bland 2013).

## Conclusion

The budget cycle is an ongoing process that repeats itself at the end of each fiscal year. This process attests to the financial accountability and transparency for state and local governments that use taxes and intergovernmental grants to maintain a balanced budget. The preparation phase identifies priorities and conduct financial planning for the budget documents. In this phase, the budget office formulates the budget into the chief executive's proposed budget. The legislative phase is additional round of check and balance by the council who determines the appropriation and provides legal authority to spend the financial resources. The executive phase compels each department into a legal binding agreement that allows for the issuance of purchasing orders and the entrance into encumbrances. Those involved in this phase must monitor the budget carefully to request corrective actions to ensure financial control. The last phase, accounting and auditing, provides additional check and balance of the entire system. Each of the phases is an integral part of the budget process that ensures the effective operation of the municipality and gives rise to good budgeting practices.

## Definition

The budget cycle consists of different phases: preparation and formulation, approbation by a vote, execution, revision, and control of the budget. The budget refers to a fiscal year, and, sometimes, the budget covers a period larger than the fiscal year (multi-year budget). The budget cycle often begins the previously fiscal year (preparation and approbation phases) and finishes the next fiscal year (control phase).

At the origin, the budget cycle symbolized the separation between the executive and the legislative powers: the Parliament by its vote approve the budget and control the execution of the budget made by the Government. Even if the budget still has this role, nowadays, it becomes a real tool for the Government in their forecasts and a tool of management.

## Introduction

The budget procedure, and especially the preparation, the vote, the execution, and the control of budget, in democracies, are established by each country even if they are addressed by various international institutions like PEFA (2016) or IMF (2007) to qualify budgetary transparency and quality of democratic debate in a country. These budget procedures are dependent on the history of institutions in each country, and, wherever it is possible, this entry will present the main models in different jurisdictions, but not aspiring to make a detailed comparison of the budget cycles in each country.

The budget cycle consists of different phases: preparation, adoption, execution, revision, and control of the budget. Instead of examining these different phases in sequence, this entry proposes to study the different meanings of the budget, which can be seen as (1) a political act of a Government and a Parliament; (2) a technical construction and revision, governed by rules and considering an underlying accounting system; or (3) an act of management, involving control and accountability.

## Budget as a Political Act: Budget Preparation and Approval

The budget is often presented as a major political act of democracy. Indeed, the budget is the instrument for the implementation of public policies and involves two major players in its preparation and its vote: the executive (Government) and the Parliament. The "principle of separation of powers" and its respect help to qualify the level of democracy of the country. It also induces a number of prerogatives or powers to the Parliament who, through the vote of the budget, authorizes the collection of taxes, defines the framework of the expenditure (public policy choices that will be funded), and sets the main budget balances. The Government, for its part, prepares the budget to be submitted to the Parliament and is also accountable for the implementation of that budget to the Parliament.

### Democracy and Transparency of the Budget Debate

Across the world, as displayed in Fig. 1, there are generally two kinds of Parliaments – unicameral Parliaments and bicameral Parliaments – whose powers may differ from one country to the other.

Parliaments organize internally the work of parliamentarians through various committees, among which there is generally a Budget and Finance Committee. In most cases, this Committee is composed of members representing the different political sensitivities and is sometimes even mandatory to be chaired by a member of the opposition. The role of these committees is essential because if the construction of the budget is the jurisdiction or the responsibility of the Executive, the Executive must then submit it to the specialized Budget and Finance Committee of the Parliament before the start of the debate by the whole Parliament in plenary session. In some parliamentary systems, the budget cannot be changed by amendments or modifications (see Table 1, some examples for African countries listed by CABRI (2008); see also Lienert (2005) who carried out a study on the Legislative and Executive power around the budget with a focus on Nordic countries and a few Asian and Latin American countries); these modifications are considered a distrust on the Government. In these configurations, the discussion of the budget is carried out within the Budget and Finance Committee, and amendments or negotiations are done prior to the presentation and the vote or approval of the budget by the Parliament (Table 2).

During the prior presentation of the draft budget to the Budget and Finance Committee of the Parliament, the Government presents, generally for a medium-term time frame, the macroeconomic forecasts, the Government fiscal objectives, allocations by major policies, estimates for the main categories of revenues, and the description of the cost of the new measures. This presentation aims to initiate a debate on the major budget aggregates and their relevance to the economic situation of the country. It must also be a way for the public or its elected representatives to understand the link between policies and budgetary

**Budget Cycle: Preparation, Execution, and Revision, Fig. 1** Type of parliament (Source: Inter-Parliamentary Union and UNDP (2012), p. 96)

allocations and to strengthen the accountability of the Government to Parliament.

In the context of the European Union, since 2014 Budget Cycle, the draft budget of the Member States should be submitted, before its vote by national Parliament, to the European Commission who gives its opinion and advises even demand some adjustment but cannot reject a budget. The new procedures are based on Article 136 of the EU Treaty. This Article enables euro area Member States to strengthen the coordination and surveillance of budgetary policies in order to ensure the necessary budgetary discipline in the Economic and Monetary Union. The new legislation therefore only applies to the euro area.

The non-governmental organization *PEFA – Public Expenditure and Financial Accountability* – defined a *Performance Measurement Framework* (PEFA 2016) to ensure the transparency of the budget debate. This framework identified seven pillars of performance of an open and orderly Public Financial Management (PFM) system (Table 3). Each of these pillars is composed of several ratios (Table 4).

## The Budget: A Bargaining Area

In principle, the budget is approved before the beginning of the year. In case the budget is adopted after the beginning of the fiscal year, e.g., due to technical or political reasons, the budget of the previous year continues (e.g., 80% of the budget of the previous year in France; in Portugal, a duodecimal regime comes to practice, meaning applying 1/12 of the precious year budget every month, until the approval of the new budget) to avoid an interruption of public services. In some countries, like the USA, no expenditure may be performed in the absence of the

**Budget Cycle: Preparation, Execution, and Revision, Table 1** Amendment powers

| Q40: What are the formal powers of the Legislature to amend the budget proposed by the Executive? | |
|---|---|
| The Legislature has unrestricted powers to amend the budget | Ethiopia, Liberia, Mozambique, Namibia[a], Nigeria[a] |
| The Legislature may make amendments but only if it does not change the total deficit/surplus proposed by the Executive | Benin[a], Congo (Brazzaville)[a], Guinea, Madagascar[a], Mali, Rwanda, Sierra Leone |
| The Legislature may only decrease existing expenditures/revenues (i.e., the Legislature cannot increase existing items nor create new ones) | Botswana[a], Burkina Faso, Ghana, Kenya[a], Lesotho[a], Mauritius[a], Swaziland, Tunisia, Uganda[a], Zambia, Zimbabwe[a] |
| The Legislature may not make any changes; it can only approve or reject the budget as a whole | Malawi, South Africa[b] |
| Other: The Legislature may not increase spending or decrease revenues | Morocco[a] |

[b]In October 2008, the National Assembly approved the Money Bills Amendment Procedure and Related Matters Bill, which outlines a procedure for amending the budget

approval of the budget by both houses (House of Representatives and Senate). In the latter case, the budget becomes a tool of power and a trading area involving new actors, as pressure groups, who will try to mobilize parliamentarians to bend the Government policies in their favor (Table 5).

The influence of pressure groups is more or less important, depending on the parliamentary system of the country (see above, Tables 1 and 2, and Posner and Park (2007)). Indeed, normally in the Constitution, each country defines the relations between the Government and the Parliament and their respective powers over amendment of the budget, the Government veto power, the power of the Parliament to override this veto or oppose its counter-vetoes, the procedure in the event of budgetary stalemate, and the time allocated for the examination and review of the budget.

The electoral representativeness of the Parliament, the majority accorded to the Government, and the role of the opposition are also crucial elements of the bargaining game (Lapsley et al. 2011). Pressure groups are involved throughout the process of discussion and approval of the budget, but in countries where Parliament has no possibility or no opportunity to amend the budget, groups may intervene upstream during the budget analysis and review by the Budget and Finance

**Budget Cycle: Preparation, Execution, and Revision, Table 2** Power to amend the annual budget. Does the legislature have unlimited powers to amend the draft budget proposed by the executive? If there are any restrictions, how severe are these?

| | Westminster | Parliamentary Monarchy | Parliamentary Republic | Semi-presidential | Presidential |

**Budget Cycle: Preparation, Execution, and Revision, Table 3** "Two-Pack" enters into force, completing budgetary surveillance cycle and further improving economic governance for the euro area

| |
|---|
| Since the launch of the euro, clear rules to ensure sound public finances have been in place in the form of the Stability and Growth Pact (SGP), which sets the well-known limits for budget deficits and public debt of 3% and 60% of GDP, respectively. However, the global economic and financial crises exposed shortcomings in economic governance and budgetary surveillance at the EU level. These shortcomings were effectively addressed with the creation in 2010–2011 of the European Semester of economic policy coordination and the six legislative proposals known as the "Six-Pack," which strengthened the SGP in a number of ways.<br>However, given the higher potential for spillover effects of budgetary policies in a common currency area, there is a clear need for still stronger mechanisms specifically for the euro area. To address this need, in November 2011, the Commission proposed two further Regulations to strengthen euro area budgetary surveillance.<br>This reform package, the so-called Two-Pack, enters into force on 30 May 2013 in all euro area Member States. The new measures mean increased transparency on their budgetary decisions, stronger coordination in the euro area starting with the 2014 budgetary cycle, and the recognition of the special needs of euro area Member States under severe financial pressure.<br>(. . .)<br>What are the main components of the Two-Pack?<br>The Two-Pack comprises two Regulations designed to further enhance economic integration and convergence among euro area Member States. The Regulations build on and complement the Six-Pack reforms to the SGP, the European framework for fiscal surveillance, and the European Semester for economic policy coordination.<br>The first Regulation applies to all euro area Member States, with special rules applying to those in the corrective arm of the SGP, the Excessive Deficit Procedure (EDP).<br>The second Regulation sets out clear and simplified rules for enhanced surveillance for Member States facing severe difficulties with regard to their financial stability, those receiving financial assistance, and those exiting a financial assistance program.<br>The Two-Pack creates a common framework in the euro area based on a graduated approach. It introduces appropriate surveillance requirements for a wide range of budgetary situations, to ensure a seamless continuity of policy monitoring.<br>(. . .)<br>**How will the Two-Pack improve euro area budgetary coordination?**<br>The Two-Pack introduces a common budgetary timeline and common budgetary rules for euro area Member States. Specifically, and starting with the forthcoming budgetary cycle:<br>By 30 April, euro area Member States must publish their medium-term fiscal plans (Stability Programs), together with their policy priorities for growth and employment for the forthcoming 12 months (National Reform Programs) in the context of the European Semester on economic policy coordination. |
| By 15 October, euro area Member States must publish their draft budgets for the following year.<br>By 31 December, euro area Member States must adopt their budgets for the following year.<br>A major innovation of the Two-Pack is that the Commission will examine and give an opinion on each draft budget by 30 November at the latest. If the Commission detects severe non-compliance with the obligations under the Stability and Growth Pact, it will ask the Member State concerned to submit a revised plan. For the euro area as a whole, the Commission will publish a comprehensive assessment of the budgetary outlook for the forthcoming year. The Commission's opinions on national budgets and on the euro area will facilitate discussions in the Eurogroup.<br>As this exercise of coordinated surveillance takes place in the autumn, i.e., between two European Semesters, it usefully complements the existing governance framework by setting the scene for the following spring as well as by providing a follow-up to the recommendations addressed in the previous one. Also, in the spirit of integrated surveillance which led to the creation of the European Semester, the Two-Pack ensures consistency between budgetary and other economic policy processes and decisions.<br>Importantly, the Two-Pack will also enhance the soundness of national budgetary processes by obliging Member States to base their draft budgets on independent macroeconomic forecasts and ensure independent bodies are in place to monitor compliance with national fiscal rules. |

[a]Responses classified on the basis of delegate comments at the Pretoria workshop

Svensson 2006). Thus, in pre-election period, budgets are often unbalanced. Similarly, the government's position (weak or strong), the weight of the opposition in the Parliament, and the quality of democratic debate are elements strongly influencing the construction of the budget. The assumptions underlying this theory are that (Downs 1957; Buchanan 2003):

1. The elector has political preferences (ideological basis, impacts of noneconomic issues, etc.), but he modulates his vote on the basis of the results of economic policies and in particular their impact on unemployment and inflation. If we assume that the elector is rational, it will prefer low unemployment and low inflation.
2. The elector has partial or insufficient information on the state of the economy, the options available to policymakers and their consequences. He ignores, in particular, the consequences or impact in the future of the public services delivered today (e.g., debt as a burden on future generations).
3. The political parties are seeking for their part to win the greatest number of votes to beat their rivals in the upcoming elections.
4. The monopoly of a political party, regardless of the intentions, has the same effects as any other monopoly: the abuse of dominant position and the preference for policies favorable to its own sustainability.

Thus, the budget is a political act, which reflects a policy of a Government subject to external and internal political order and economic

pressures. But the budget is also a technical act in the sense that it must comply with certain rules in its construction.

## Budget as a Technical Act: The Budget Elaboration

In the phases of preparation, implementation, and revision of the budget, the technical dimension is often predominant. However, in recent years, many countries opt for a more managerial dimension, especially to cope with budgetary constraints and improve the performance of public action.

The budget process often begins 1 year before the start of the fiscal year. It leads to define the amount of revenues and their allocation between the various Ministries through the budget guidelines (e.g., fiscal plans or letters sent to each Ministry which indicate, for example, the maximal amount of expenditures they can engage).

Revenues are in most cases estimated by the Ministry in charge of finance affairs, adjusted by policy measures of other Ministries related to tax credits for expenses (e.g., for investments aimed at the reduction of energy consumption). Naturally, this amount often depends on the economic situation of the country (corporate profits, growth, consumption, corporate profits, unemployment, etc.), and this is why estimated revenue figures rely on economic forecast established by national or supranational statistical agencies such as Eurostat for Europe, the IMF, or the World Bank.

With regard to expenses and expenditures, the government defines budget guidelines by Ministry. These budget guidelines determine the maximum expenditure limit (often with details) on the amount allocated for investment expenditures (including debt repayments), payroll-related expenses, and current operation expenses.

Some of these expenditures could be classified as mandatory and are clearly identifiable as coming from previous commitments (e.g., repayment of debt, interest, amount due to a public contract which committed the State over several fiscal years, etc.). Others must be estimated. This is, for example, the case of the salaries of active personnel, which depend on the number of retirements, the rate of renewal of these departures, the impact of the effect of career development for civil servants (promotion), and the upgrading of salaries in line with inflation if necessary, among others.

These budget guidelines determine the financial flexibility and scope of each Ministry, following the general guidelines set by the Government. The Ministers may then make counterproposals, and a second phase is devoted to the budgetary arbitrations and decisions by the Government.

At this stage, two budgetary strategies are present: to propose an input-based budget (financial allocations) or to propose an outcome-based budget (objectives and results to be achieved). These budgets also may cover a single fiscal year or cover a multi-year period.

### Input-Based Budget

An input-based budget (or budget based on financial allocations) will present the various items of expenditure according to their nature and between the services of the Ministry. Let's take the example of a budget for education representing 10% of the State's budget. In a presentation of the budget based on financial allocations, it divides, for example, in 60% in payment of wages, 20% in current expenditure, and 20% in investment expenditure, and these amounts will be divided between the primary, secondary, and higher education.

In the development of these budgets, often the operators renew the allocated amounts by incorporating the effects of inflation, without connecting them systematically to public policy and achievements or outcomes.

With this presentation of the budget based on financial allocations, dissension may occur between Ministries (and specially between the several ministries and the Minister of Finance), and each Minister will have at heart to have the biggest budget or, in case of budgetary restriction, to be the least affected, in order to show that he was well able to defend his budget and his Ministry.

In this logic of resources allocated to departments, the dimension of public policies to implement and results or outcomes to be obtained is put in the background. The construction of the budget

is then primarily technical and translated the political power of a Minister to fight against this trend, and experiments were launched in some countries, either using the Zero-Based Budgeting or developing budgets based on results to be achieved or outcomes.

### Outcome or Performance-Based Budget

A budget based on objectives and outcomes to achieve involves identification of the major missions and tasks of a Ministry and the actions that it intends to implement to achieve this. The question is no longer how much the Ministry has consumed of the financial allocations at its disposal but if the Ministry has achieved the objectives it had set upstream and for which it has defined indicators of activity (Robinson 2007).

The construction of the budget under this strategy takes a strong managerial dimension, because it involves to operationalize public policies through missions, actions, and indicators.

The passage of a budget based on financial allocations to a budget based on outcomes is an important challenge in terms of the managerial functioning as it implies for the Ministries to identify the strategic objectives and then to divided them in programs and operational actions. This presentation of the budget leaves more flexibility for program managers, because the Parliament generally votes distribution by major programs and allows also reallocation of resources between actions within a program and also reallocation, within an action, between the different types of expenditures (Posner and Park 2007). For example, in France it is possible to transfer credits from the current operating expenses to investment expenditures and vice versa. As a general rule, the reallocation of credits does not include staff costs, which are subject to a separate vote of the Parliament with a spending limit that cannot be exceeded. Indeed, the recruitment of an official during a fiscal year then engages the State over the following years and therefore permanently compromising the budgetary leeway.

Budgets based on outcomes to be achieved are a more interesting qualitative source of information for parliamentarians than the ones based on financial allocations. They are sometimes coupled with a monitoring of multi-year commitments or even with a multi-year budget monitoring.

### The Monitoring of Multi-Year Budget Commitments

One of the main budgetary principles is "annuity." Nevertheless, several countries now distinguish the concept of "commitment" or "budget authority," which can lead to obligations for future years, and the concept of "payment appropriations" or "outlays," which is the amount committed during a fiscal year (Posner and Park 2007).

For example, in France, the commitment authorizations are voted by the Parliament and constitute the upper limit of expenditure which may be incurred. These authorizations limit the legal commitments that governments are permitted to contract with third parties on behalf of the State. Payment appropriations are also voted by the Parliament and constitute the upper limit of expenditure which can be scheduled or paid during the year to cover commitments. These payment appropriations retrace as and when payments cancel the debts incurred by the State.

The duality of budget authority for expenditure, in payment appropriations and commitment authority, involves having a twofold monitoring within the budgetary accounting: at the time of their opening after the vote by the Parliament of the commitment authority and payment appropriations and then at the time of consumption of credits (Ministère des finances et des comptes publics 2015).

However, this distinction between commitment authorities and payment appropriations is complex for staff costs. Indeed, the commitments arise from a multitude of management acts, not only recruitments but also of promotions, revaluations of compensation or treatment, etc., without one that can assess precisely neither the total impact nor its timing throughout the years concerned. Therefore, for this expenditure item, rather than a commitment authority, an employment limit in full time equivalent and currency is sometimes implemented. This limit is both the commitment authority and the annual payment appropriation, as Example 1 illustrates.

**Example 1 Mechanism of Payment Appropriation and Commitment Authority in France**

For a public contract for a total amount of €100,000 over 2 years, the following appropriations are as follows:

- Fiscal year N
  Expenditure commitment corresponding to the entire public contract: €100,000
  Payment appropriations for the first instalment: €50,000
- Fiscal year N+1
  Expenditure commitment: 0 (the expenditure was incurred during the fiscal year N)
  Payment appropriations for the second instalment: €50,000

In this example, one will open more payment appropriations than commitment authority during the fiscal year N+1, but the total amount of commitment authority is equal to the sum of payment appropriations (€100,000).

However, States may provide more relevant budget information by presenting multiannual information, attempting to measure the impact of budgetary provisions on the balanced budget in the medium term and therefore the sustainability of fiscal policies.

## Multiannual Budgets

The practice of the multiannual programming tends to develop in OECD countries. A few examples are the following: Canada makes estimates up to 4 years (different duration depending on the State and federal level); Australia has a multiannual budget over 4 years and France over 3 years; in the USA, the Congressional Budget Office (CBO) publishes *The Budget and Economic Outlook*, which covers a ten-year window. The European Union sets a multiannual financial framework over 7 years, reflecting the priorities of the EU, without being a budget for 7 years but a basis for its annual budget exercise (Schick 2005).

The multiannual programming allows to integrate the fact that the budget annuity principle is increasingly questioned, because some commitments (in particular some procurement or public contracts) may have budgetary implications over several years. Countries opting for multi-year budgets are able to provide to their Parliaments more complete budget documents and better qualitative information (Auerbach 2011). Multiannual programming also requires strengthened and coordinated control of expenditures and revenues.

**Example 2 Multi-Year Budget in France**

**Programming of expenditures over 3 years**

The multiannual budget includes a program of State's expenditure over 3 years: an overall limit of State's expenditure and expenditures limits by major missions or public policies. The overall limit includes budget expenditure of the State, levies from revenue for the benefit of the EU or local authorities, as well as tax allocations. The limits are imperative for the first 2 years and may be adjusted in the third year.

**Triennial budget and Finance Bill**

For each year of the budgetary programming, projects of finance bills are prepared and presented to the Parliament in accordance with limits set in the triennial budget. The preparation of the finance bill now follows a different procedure in even years (preparation of the triennial budget) and in odd years (updating of the second three-year term of the budget).

In the first year, the expenditure limits set at the level of missions and the distribution of funds by program are those enrolled in the initial finance bill of the year and thus are considered as certain.

In the second year, the limits on expenditure for missions are considered not

(continued)

subject to revision. However, they may be revised in certain exceptional cases. On the other hand, the distribution of appropriations between programs of a mission, planned in the preparation of the triennial budget, may be revised in compliance with the limit of the mission.

In the last year, however, credits per mission may be subject to further adjustments. This third-year "revised" programming is therefore the starting point of the new multi-annual budget for the three following years.

Source: www.performance-publique.budget.gouv.fr/budget-comptes-etat/budget-3-annees/

Often, these multi-year budgets are a way to define the multiannual guidelines for public policies in the medium term, and this is an objective of balance of the financial statements of Government and fiscal sustainability (Auerbach 2011).

### Commitment Authority: An Essential to the Analysis of Fiscal Sustainability

Accounting for commitment authorizations traces the initial budget allocation and consumption upon notification of legal acts in which the State engages (IPSASB 2016). These are indeed legal commitments, which consume commitment authorizations up to the amount of firm commitment; they materialize the birth of the obligation of the State, which will result in an expenditure. In contract, purchase order, or grant notification, the legal commitment is indeed the founding act of the expense.

The accounting of commitment authorizations also determines, at the end of a fiscal year and with the reconciliation with payments, the balances payable, namely, the commitment authorizations consumed and not payed. The balances payable thus allow accurate assessment of payments that will intervene in a subsequent fiscal period and be deducted from the realization of future budgets.

Fiscal sustainability in the short or medium term is based on a program of legal commitments, giving rise to deadlines of provisional payments compatible with the limit of payment allocation defined in the budget, not only in respect of the current fiscal year but also for following fiscal years.

To supervise effectively the State's management and to obtain reliable future expenses and costs, the amount consumed in commitment authorizations is the total amount of the commitment made, including for the part that will give rise to a disbursement on a subsequent fiscal year.

### Multi-Year Expenditure Management and Sincerity of the Budget

The multiannual budget has two main advantages (Schick 2005; Posner and Park 2007).

First, it allows to strengthen the role of parliamentarians who control now the two ends of the chain of expenditure, authorizing the commitment of the expenditure and its regulations. Payment appropriations and commitment authorizations are voted by the Parliament for a fiscal year. The commitment authorizations not consumed shall, in principle, be canceled, according to the budget regulations, except when they correspond to investment projects, which involve legal commitments over several years.

The commitment authorizations can also neutralize the effects of the reallocation between appropriations: they ensure that the substitution of expenditure, with its own temporality, by another whose schedules may differ, is *in fine* neutral for the budget, since the cumulative amount of the corresponding commitments across fiscal years remains unchanged.

Finally, by giving full visibility to managers and to parliamentarians on payments made at the end of a fiscal year, while tracing the balance payable, accounting for the commitment authorizations and payment appropriations reconciles multi-year expenditure management and scope of the annual budget.

The budget is also a managerial act in the sense that once the budget is approved, it must be implemented by managers.

## Budget as a Managerial Act: Budget Execution and Revision

With the vote of the initial finance bill, the Parliament gives the Government a budget authorization akin to an option, but not an obligation to spend. The execution of the State's budget obeys a number of rules designed to ensure that the execution is carried out as close as possible to the will expressed by the Parliament while giving managers some flexibility.

### Monitoring and Control of Expenditure Budgets

The Budget Department, within the Ministry of Finance, carries out the monitoring and steering of the implementation of the State's expenditure in transverse way, ensuring the regularity of the management, the sustainability of public expenditure, and the compliance of execution with regard to the budgetary commitments voted by the Parliament through the finance bill.

This responsibility can materialize especially at the beginning of the fiscal year by the constitution of a "reserve of precautionary," which permits to put aside a part of appropriations for each program, as explained in Example 3. This reserve is an essential tool of budgetary control to cover the ups and downs or contingency expenditures that can occur during the execution of the budget.

**Example 3 Mechanisms of the Reserve of Precautionary Set-Up in France**

Under the French Organic Law (Article 51) and the multiannual budget law for 2012 to 2017 (Article 6), the precautionary reserve is to make unavailable, at the beginning of the fiscal year, a fraction of the appropriations voted in the budget. This reserve is formed at the beginning of the fiscal year by the application on each program of differentiated rates (at least 0.5% of appropriations under staff costs and 5% for other expenditures in the general budget). It offers to the Government a flexibility easily mobilized to deal with credit risks and hazards arising during the year. It also helps to maintain a certain "stress" on expenditures of the different Ministers.

In each Ministry, program managers are required to establish an initial budget programming, which takes into account the reserve; the budget controller ensures the accuracy of calculating the sums set aside. During the budget execution, it belongs to the Minister of Finance to decide or not about partial release of credit, program by program, to face, for example, unavoidable expenditure.

Source: http://www.performance-publique.budget.gouv.fr/actualites/2013/maitrise-depenses-etat-mise-en-reserve-credits-gestion-2014-0#. VnfM8hFglLM

The responsibility of the Minister of Finance for enforcement requires also continuous monitoring and analysis throughout management to understand, predict, and anticipate changes in the State's expenditures.

Considering that the Budget meanwhile passed as a law was built on macroeconomic and financial assumptions, the budget management may face unforeseen events during the execution: e.g., various hazards may occur on expenditure management such as natural disasters, unforeseen new needs, etc. The Ministry of Finance must therefore anticipate, throughout the year, what will be the total amount of expenditures at the end of the fiscal year (including unpredicted expenditures) and propose, if appropriate, corrective measures or actions when the forecasts tend to deviate from the initial budget bill.

**Example 4 The Case of the "Zero Value Standard" Implemented in France**

The steering of the implementation of the State's budget is performed through the monitoring of expenditures standard – the "zero value standard" – which is one of the

(continued)

main tools of management and control of public finances at the disposal of the Government.

When the Government proposes the Budget Bill to the Parliament, it is committed to control the expenditure of the State and respect the "zero value standard." These standards of expenditure intend to give a simple management tool that allows the Government to be accountable for its steering and monitoring of State's expenditure before the Parliament.

The "zero value standard" covers all the expenses of the State considered controllable, therefore excluding the burden of debt and the contributions of the State and its operators for the financing of pensions of officials, which are rigid expenses, inherited from the past, and therefore hardly controllable.

The "zero value standard," introduced in 2011, aims to avoid that potential gains from under-implementation of the burden of debt and pension reform are used to fund other expenditures; it is therefore a virtuous rule that facilitates the reading of the execution of the State's budget implementation; the Government in this way commits that the controllable expenditures do not increase or even decline from 2014 in constant euros compared to the previous fiscal year.

The "zero value standard" requires greater rigor and transparency in monitoring the implementation of State's expenditures: to serve as a supporting tool to the decision, this standard must indeed be revised during the year by analyzing State's expenditure estimates, item by item, program by program, and Ministry by Ministry.

Source: http://www.performance-publique.budget.gouv.fr/budget-comptes-etat/execution-budget-etat/essentiel/s-informer/prevision-suivi-execution-budget#. VnfDaRFglLM

The Ministry of Finance conducts periodic work of analysis of the implementation of the expenditure. Analytical works permit, using available data on the management of the previous fiscal year, to update the forecasting execution of the current year compared to the assumptions used to build the initial budget. These analyses are used to update data on the determinants of the expenditure, as the number of beneficiaries of a benefit paid by the State, and, more generally, to take into account in the forecast of expenditures' any new factor – or hazard – that may cause a gap from the forecast established at the time of the initial budget bill.

To estimate the level of spontaneous evolution of the expenditure, the Ministry of Finance shall organize an exchange of information with the relevant Ministries. This information is confronted with statistical history of previous years and other relevant information of the public sector or the economy.

In addition to regular exchanges during the year with the Ministries' correspondents, the Ministry of Finance can also rely on the expertise of accounting and budget controllers in each Ministry, which are in contact daily with Ministry's managers and have therefore a good knowledge of the technical records of the Ministry to which they are placed. These exchanges are formalized in infra-annual meetings and interim management reports, which also help to identify possible difficulties during the budget execution and to analyze the gaps occurring with the initial budget bill. The Ministry of Finance uses this information to establish a forecast of the spontaneous evolution of State's expenditures and then to propose measures that will correct these gaps.

The forecast conducted by managers also covers staff costs. For example, in France, the Ministry of Finance monitors with the Ministries of all statutory and compensatory measures applicable to staff. For this, the Ministry of Finance has general jurisdiction to countersign draft regulatory texts related to the public service or to officials who have direct or indirect financial implications. On the expenditure themselves, whether in terms of employment or payroll, the

Ministry of Finance ensures that the assumptions underlying the ministerial job schemes, i.e., the outputs or recruitment needs, are consistent and proven and especially that the job limits set up in the budget are respected at the end of the fiscal year. For payroll, it is important that expenditure has been properly evaluated and if necessary to adjust appropriations.

At the end of the fiscal year, the forecast is used as a diagnostic by the Government to decide on possible corrective measures to be implemented before the end of the year, to ensure that final expenditure complies with the original intention and is consistent with the objectives of budget targets voted by the Parliament.

### The Monitoring of the Results of Budget Execution by the Parliament

The Parliament examines, during the fiscal year N+1, the report on the implementation of the budget of year N and the financial statements for the year N. The budget and financial statements may be subject to different accounting rules – for example, the budget can follow the legal commitments and receipts/disbursements, while the financial statements are prepared in accordance with accrual accounting.

During the presentation of the budget execution to the Parliament, several documents can be handed over to elected representatives, depending on the accounting obligations of the State in each country. The following information is generally provided (IMF 2007; IPASAB 2016):

- A reporting information with the financial outcome of the year, according to both the budgetary accounting statements and the financial accounting statements
- Information on budget performance, including a thorough presentation of annual performance reports by major public policies and the financial outcome of each Ministry with regard to commitments made during the budget vote
- The auditor's report on the certification of the State's budgetary and financial statements by the SAI and eventually by a private organization
- The report on financial outcomes and fiscal management of the State carried out by the SAI

Even before the end of the fiscal year, it can also be forwarded to the Parliament a monthly situation of the State's budget. This is a photograph of the infra-annual execution of the State's budget by recording, month after month, the main accounting items: expenses, revenues, balance of special accounts and their overall result, and the balance of the general budget. Based on the financial accounting data, monthly budgetary situation offers a synthetic vision of the evolution of budget execution of the State's during the fiscal year. It also allows comparisons with the results observed during the prior years to the same periods of the year.

This reporting on the monthly budgetary situation allows economic commentators to appreciate the trends month by month for all factors that contribute to the formation of the current execution of the budget balance. It is often commented by the Minister of Finance that puts into perspective the data to local or global economic conditions.

This communication derives from a desire for financial transparency, thus contributing to strengthen knowledge and understanding of the execution of the State's budget. It is part of a code of good practices on public finance transparency designed by the International Monetary Fund (IMF 2007).

Good practices also include the publication, according to a schedule announced in advance, the monthly situation of the State's budget. The publication, by the State, of the monthly budgetary indicators allows all stakeholders involved in the budget situation of a country, including the creditors of the public debt; international organizations such as the World Bank, the IMF, and the European Union; and the citizens in general, to stay informed of the monthly evolution of the situation of public finances.

## Conclusion

The budget is both a political act and a negotiation or bargaining between the Government and the Parliament and other stakeholders. It is also a technical act, considering that most countries have defined fiscal rules and standards governing both the preparation and the execution of the budget. These rules can be aimed to ensure that authorizations voted by the Parliament are well respected, but also to provide information on multi-year commitments that permanently commit a State. Finally, during the execution phase, the budget is a managerial act too. The New Public Management has, in recent years, deeply changed the role of budget managers. Thus, new jobs have appeared in Ministries, such as fiscal and financial controllers. Similarly, the objective of public sector managers is not to spend money but to develop and implement actions to achieve results and to report and to be accountable to the Parliament for both the Government action and the implementation of public policies.

Additionally, even if this has not been addressed in this entry, the budget is also an "accounting philosophy' with different countries to be able to choose between using an accrual basis regime or a cash basis regime to elaborate the budget, despite the financial statements being based on an accrual accounting system.

# Budget Execution: Spending Patterns During the Fiscal Year

Birgit Moser-Plautz
Department of Public, Nonprofit and Health Management, University of Klagenfurt, Klagenfurt, Austria

## Synonyms

Budget implementation

## Definition

The public budget contains the maximum expenditures allowed, with their planned utilization and the estimated public revenues for the budgetary period needed for covering the expenditures. The administrative bodies are responsible for executing the budget as approved by the legislative branch. Spending patterns within a budgetary period are about the timing and the amount of budget spent during the fiscal year (e.g., a peak in spending at the end of the year).

## Introduction

Public sector organizations are under increasing pressure to spend taxpayer's money efficiently and sustainably to create public value, as resources decrease and legitimacy problems surge. Budgeting is the process where public policies are prioritized and a government's revenues and expenditures are monitored and controlled. The budget determines expenditures for objects as well as purposes and thus links financial resources and human behavior to achieve certain policy targets (Wildavsky and Caiden 2001). In this regard, not only allocating scarce resources but also the execution of the budget has become central issues in public finance. Budget execution came up as a link to reforms in practice, but has been neglected in academic literature, as Cain et al. (2004, p. 558) states: "While budget execution remains an integral phase of the budgetary process, it continues to be overlooked in the academic literature." Nevertheless, in the academic literature are three intertwined research streams about budget execution observable: (1) budget control, (2) rebudgeting, and (3) spending patterns during the budgetary period. The first research stream investigates budget control systems used to control budgets and spending behavior in public sector organizations, focusing on the design, use, and effectiveness of budget control instruments. The second stream examines rebudgeting – changing the approved budget during the fiscal year. And the third research stream focuses on spending patterns within a fiscal year, investigating the timing and the amount of budget spending, and if spending patterns exist like heightened spending at the end of the year. The literature on the spending patterns examines the underlying causes for certain patterns and consequences and discusses remedies against dysfunctionalities.

This contribution is structured as follows. The next section provides an overview of the budget cycle in particular of the phase of budget execution. Section three looks at the different spending patterns and section four discusses different remedies. The conclusion is provided in the final section of the contribution.

## The Budget Cycle: Budget Execution

Budgeting is a process and can be distinguished into different phases. In general, four phases are identified: Preparation and submission, approval, execution, and audit. The budget cycle overlaps 3 years, in the first year the budget draft is prepared and approved usually by the legislative branch of government, with the start of the fiscal year the budget is executed by the executive branch of government and after the close of the fiscal year, the budget is audited, therefore the legislative branch examines the implementation reports and financial statements for the previous fiscal year. As the budget is usually for one fiscal year, an organization has to deal with three budgets at the same time, as shown in Fig. 1.

| | | Fiscal Year 1 | Fiscal Year 2 | Fiscal Year 3 | Fiscal Year 4 |
|---|---|---|---|---|---|
| 1 | Budget preparation | B1 | B2 | B3 | B4 |
| 2 | Budget approval | B1 | B2 | B3 | B4 |
| 3 | Budget execution | | B1 | B2 | B3 |
| 4 | Budget audit | | | B1 | B2 |

**Budget Execution: Spending Patterns During the Fiscal Year, Fig. 1** Overlapping budget cycles. (Adapted from Pfäffli 2011, p. 19)

Only after the budget is approved, the administration is allowed to make expenditures within the approved limits and to generate revenues for fulfilling their tasks. Thereby expenditures ceilings can be exploited but do not have to (Pfäffli 2011). While budget preparation is a planning act, budget execution is a management process (McCaffery and Mutty 1999), which is less visible than the preparation and approval phases are, in particular, the latter is open to the public with hearings and debates. Day-to-day routines in the execution phase are not public unless legislative approvals or notifications become necessary. Although budget execution is often assumed as a mechanical task, the degree of discretion by public managers in budget spending as well as unforeseen events and uncontrollable circumstances make the budget execution a complex process. Depending on different scientific authors' views, monitoring and controlling budget execution during the fiscal year is sometimes assigned to the execution phase and sometimes to the audit phase. Monitoring budget execution should detect deviations from the planned budget in order to set corrective measures, but these controls should be balanced with the level of discretion and flexibility in budget spending by public managers (Cain et al. 2004).

## Spending Patterns

Although there is a limited number of publications investigating budget execution, research identified two spending patterns, most publications investigate spend-downs at the end of the fiscal year and only a limited number of contributions focus on expenditure deferrals (e.g., Baumann 2015). Reviewing the literature shows a multiplicity of terms for spend-downs, which makes the research field complex and diversified. Terms for spend-downs range from spending sprees, spending surges, September Grasshoppers, June end-play, and March Madness to December fever. One reason for the limited number of studies on spending patterns is that spend-downs are often hidden from the public and even more from the researchers. Nevertheless, some contributions analyzed monthly spending data and were able to show an increase in spending in the last months of the fiscal year (e.g., Balakrishnan et al. 2007; Fichtner and Greene 2014; Liebman and Mahoney 2013).

The analysis of the literature shows that some contributions focus on the underlying causes of spending patterns (e.g., Forster 1990), and some concentrate on the analysis of archival data aiming to find evidence for (wasteful) spend-downs (e.g., Fichtner and Greene 2014), while others discuss remedies to avoid spend-downs without investigating the underlying causes or evaluating already implemented remedies (e.g., Hyndman et al. 2007). The working paper by Liebman and Mahoney (2013) has a hybrid focus, as it looks for evidence for spend-downs as well as for their wastefulness, and additionally investigates several remedies.

The contributions show some conflicting findings regarding the underlying causes and explanations of wasteful spend-downs. Forster (1990), one of the first scientific works on this topic, already described the underlying causes for wasteful spend-downs in detail and named "uncertainty" and "risk" as the main drivers for

deferring expenditures and budget exhaustion at the end of a fiscal period. Only a few publications refer to Forster's paper (1990) and investigate the mentioned causes. In contrast to the contributions put forward by the economics and operations research discipline, where the main assumption behind spend-downs, or rather lapsed funds is that this is the result of rational behavior of public managers (i.e., doing their jobs properly) (Douglas and Franklin 2006; Forster 1990; Liebman and Mahoney 2013). Uang and Liang (2012) see the problem in an opportunistic behavior by public managers. Other contributions identify the rules themselves as the reason for spend-downs or procrastination resulting in spending deferrals (Baumann 2015). In contrast, Balakrishnan et al. (2007) used institutional theory and argued that spending the whole budget at the end of the fiscal year is a socially accepted behavior. Literature in this research field either does not refer to a theory or refers to principal-agent theory, the predominance of principal-agent theory might stem from a strong economic perspective.

## Remedies for Wasteful Spend-Downs

Literature on spend-downs at the end of the fiscal year recommends several remedies for wasteful spend-downs, which either reduce disincentives for budget surpluses or create incentives for surpluses (Reiter 2016). The most frequently discussed remedies: carry over rules, extension of fiscal year, limiting spending at the end of the fiscal year, transferring funds/virement and closer monitoring are summarized in the following.

### Carry-over Rules

This remedy allows carrying over unspent funds to the next fiscal year and has been part of several New Public Management reforms with the prospect to increase efficiency and flexibility in budget spending. To avoid spend-downs the funds carried forward should be well protected and available for the respective unit. In addition, savings should not be seen as a signal for lower budget needs and result in budget cuts for the respective unit.

Douglas and Franklin (2006) developed a framework for understanding potential costs and benefits of agency surpluses, for details see Fig. 2.

Lienert and Ljungman (2009) argue that carry-over rules are based on three assumptions: appropriate budget allocation in relation to the tasks of the budget unit, only a small portion of the approved budget will be carried over, and the timing of expenditures is not important for the budget authority. As the assumptions are only rarly met in practice, evaluations are necessary: "i) if a carry-over is justified; ii) how much of the unspent appropriations should be allowed to be retained, and iii) if the carry-over should be allowed to be used in a particular year" (Lienert and Ljungman 2009, p. 6). Over the years a significant amount of savings can accumulate, which could threaten aggregate fiscal targets. Therefore, restrictions should be applied regarding the time and the volume of carry-overs (Fichtner and Greene 2014; Korac et al. 2019). In addition, Lienert and Ljungman (2009) recommend that six preconditions should be fulfilled before a country implement carry-over rules: accurate appropriations, well-developed accounting and reporting systems, access to financing, well-functioning internal control and external audits, devolved budget management powers, and a medium-term approach to fiscal policy.

### Extending the Fiscal Year

Most public administrations use annual budgets, prolonging the fiscal period could give public managers the possibility to spend unused funds more wisely. However, extending the fiscal year could just defer the wasteful spending-behavior, and in addition, it comes at the costs of flexibility to respond to new information (Pollack and Zeckhauser 1996). An alternative would be extending the period of obligation, where the approved budget is allowed to be spent within, for example, 2 years, but appropriations are made annually (Jones 2005).

### Limiting Spending at the End of the Fiscal Year

Research shows that certain categories like goods and services are more prone to spend-downs than

**Budget Execution: Spending Patterns During the Fiscal Year, Fig. 2** Framework for understanding potential costs and benefits of agency surpluses (Douglas and Franklin 2006, p. 51)

other categories like pay and benefits for employees, for these categories one could set spending limits at the end of the year (Kozar 1993). An alternative would be a time variant budgetary tax to even out the expenditures during the fiscal year (Baumann 2015), which would make spending in the later months more expensive.

### Aggregating the Budget of Subunits

Aggregating the budget of subunits could be a remedy for inefficiencies of decentralized budget spending. Pollack and Zeckhauser (1996) argue that aggregating budget subunits would lead to fewer deferrals at the beginning of the fiscal year due to risk sharing. The argument is that units defer spending to the end of the year as the uncertainty about unforeseen costs is the highest at the beginning of the year and decreases as the year proceeds. A disadvantage would be the common pool problem of excess expenditures as monitoring becomes more difficult.

### Transferring Funds

Literature also recommends increasing the flexibility of public managers by the possibility to transfer funds from one account to another, although this remedy could result in a lack of control by the central authority (Pollack and Zeckhauser 1996).

### Closer Monitoring

The remedies described above lead to more flexibility and discretion for public managers that could result in unintended and opportunistic behavior, which makes closer monitoring and control necessary. Brimberg and Hurley (2015) recommend an audit focus on expenditures at the end of the fiscal year. Another example of closer monitoring is mid-year budget reviews, which on the other side could create incentives for spend-downs before the mid-year review.

### Improving Information System

If uncertainty about occurring costs is the cause for spend-downs at the end of the fiscal year, an improved information system could reduce uncertainty and help budget units to spend the approved budget in time. Nevertheless, an improved information system could solve the problem of spend-downs only to some extent (Brimberg and Hurley 2014).

### Surpluses Should Not Justify Future Budget Cuts

An incentive for spend-downs is possible budget cuts in the future, as it could be a signal of overbudgeting. Budget units with efficiency savings should not be punished with budget cuts, but rather rewarded for spending taxpayer's money carefully. Although the concept is simple, it would mean a fundamental change of a budgeting rationale (Reiter 2016).

## Conclusion

Budgeting is a process often divided into four phases: budget preparation, budget approval, budget execution, and audit. While budget preparation and approval are about planning, budget execution is implementing the budget as planned and thereby less public than other phases in the budget cycle. Nevertheless, budget execution is not a mechanical task, as public managers have discretion about the amount and timing of spending during the fiscal year. For this reason, spending patterns can become visible, like spending deferrals at the beginning of the year and spend-downs at the end of the fiscal year. Despite the growing attention in research and practice toward spending patterns, especially on wasteful spend-downs, only a limited number of journal articles and other scientific publications have up to now addressed this topic. Spend-downs are often only of anecdotal evidence, and nevertheless, some studies addressed this issue and discussed remedies against spend-downs, like the possibility to carry over unspent funds.

# Budget Formulation Process of Japan's National Government

Harunori Yamada
Faculty of Political Science and Economics, Waseda University, Tokyo, Japan

## Synonyms

Bureaucracy; Public finance

## Definition

The framework by the Cabinet and the Diet to formulate the Japan's national budget

## Introduction

Japan adopts three-tier government system; the national government, 47 prefectural governments, and about 1700 municipal governments, each having authority to formulate its own budget. We simply call the national budget. But Japan does not adopt the unified budget system. The national budget of Japan for fiscal year 2017 can be divided into 14 budgets. The national government's budget of Japan consists of the general account budget and 13 special account budgets. These budgets are formulated by the government and submitted to the Diet for approval along with the budgets of four government-affiliated financial agencies.

The general account budget is the most fundamental budget of the Japanese national government. Therefore, when we just simply say "the budget" in Japan, it often means the general account budget. All national taxes except several special-purpose taxes are treated as the revenues of the general account budget. According to the Public Finance Law, "Zaisei hou," all expenditures for each fiscal year must be financed by the revenues of that fiscal year, which is called the single-year budget principle. The expenditures of the general account budget are classified according to the government programs, such as social security, public works, education and science, and national defense. We can see the overview of the government's policies and activities through the general account budget. Special account budgets are established by legislation when the government needs to carry out specific projects, or to administer and manage specific funds, or to administer revenues and expenditures separately from the general account budget (Ministry of Finance 2004, p. 3).

Budget formulation process of Japan's national government is largely composed of two stages: the government stage and the Diet (parliament) stage. The government stage is at which the budget is formulated within the government. The Diet stage is at which the budget is deliberated in the Diet. The climax of the budget formulation may be regarded as residing in the parliament stage in

many countries. Oppositely, it resides in the government stage in Japan.

## The Government Stage

### Ministry of Finance

Under the Constitution of Japan, only the Cabinet has the right to prepare and submit the budget to the Diet. In case of ordinary bills, members of the Diet as well as the Cabinet can submit the draft bills according to the law "the Diet Act." However, unlike the case of ordinary bills, any Diet members do not have authority to submit budget proposals to the Diet (Ministry of Finance 2004, p. 13).

The Cabinet of Japan is composed of the Prime Minister and Ministers of State. Under the Cabinet law, the number of Minister of State is limited within 14, but when necessary, the number can be raised up to 17. One of the Ministers which composes the Cabinet is the Minister of Finance, which is the top of the Ministry of Finance.

Among the Cabinet, the Ministry of Finance has primary jurisdiction over budget formulation. The Ministry of Finance of Japan is now called "Zaimu-sho" in Japanese, but it had been called "Ohkura-sho" until 2001 despite English name still remains unchanged as the Ministry of Finance. The name "Ohkura-sho" had a long tradition from the beginning of the eighth century. Ohkura-sho, having authority over both of the fiscal policy and monetary policy, had been credited with the prominent power. So especially in the past, powerful members of the ruling party, who have experienced other Ministers or high-ranking executive posts among the ruling party, have been usually nominated as the Minister of Finance. Experiencing Minister of Finance was regarded as a gateway to be a Prime Minister.

Due to the prominent power it had, the Ministry of Finance was regarded as one of the main targets in the central government reform which was enacted in 2001 by Hashimoto Cabinet. Consequently, Ohkura-sho was wrested control over the banking and other financial policies, broken up into the Zaimu-sho and Kinyu-cho (Financial Services Agency) and renamed from Ohkura-sho which had a special meaning to more ordinary name Zaimu-sho.

The Ministry of Finance is one of the 11 ministries of Japan. The Ministry of Finance has primary jurisdiction over public finance including budget formulation, and within the Ministry, the Budget Bureau, "Shukei-kyoku," is in charge of drafting the budget. There are other bureaus in the Ministry of Finance which are related to budget formulation: Tax Bureau which is in charge of tax system, Customs and Tariff Bureau which is in charge of customs and tariff, and Financial Bureau which is in charge of issuance of Japanese government bond. Among these bureaus, the main bureau for the budget formulation is the Budget Bureau. Since the budget formulation is regarded as the most significant duty in the Ministry, the head of the Budget Bureau, the Director General of the Budget Bureau, "Shukei-kyokucho," will be usually expected to next promote to the Administrative Vice Minister of Finance, "Zaimu-zikan," which is the head of the tens of thousands of officers of the Ministry of Finance.

### The Outline of the Government Stage

The fiscal year in Japan's national budget begins on April 1st. The budget formulation process begins in the summer of the previous year. In the initial stage, each ministry makes budget request and submits its budget request "gaisan youkyu" to the Ministry of Finance by the end of August of the previous year. But it is not the real start of the budget formulation process. About 1 month before these budget requests, usually by the end of July, the Cabinet approves the guidelines for budget requests, which is called "gaisan youkyu kizyun" in Japanese (Ministry of Finance 2004, p. 14).

The guidelines for budget requests set out ceilings for programs such as social security, public works, and other expenditures for the next fiscal year's budget request. These ceilings are usually expressed in terms of absolute or percentage increase or decrease against the previous fiscal year's amount. The guidelines also establish special priority-allocated categories in order to promote the allocation of funds to politically

targeted areas. Since each ministry is required to prepare its budget request within the limits of these guidelines, each ministry needs to determine the priorities of the expenditure items within the ministry before submitting its request to the Ministry of Finance. Therefore, these guidelines are regarded to be effective in controlling each ministry's inclination toward making excessive budget requests. This system has played an important role in curtailing overall government expenditures since first employed in the fiscal year 1961 budget (Ministry of Finance 2004, p. 14).

Following the submission of budget requests, budget examiners of the Budget Bureau in the Ministry of Finance start a series of hearings with each ministry on the details of the budget requests. Budget examiner is called "shukei-kan" in Japanese. Budget examiners are elite division director class officers around mid-1940s and early 1950s. The budget examiners review each budget item, requesting additional supporting materials and data as necessary (Ministry of Finance 2004, p. 15).

The budget examination process continues, and usually around early December, the Cabinet releases the "basic principles of budget formulation" and the ruling party(ies) releases(se) "outline of budget formulation" and "outline of tax system reform." Following these decisions, final negotiations are held between the Minister of Finance and each Minister, which are called Minister negotiations, "daizin sessyou." After the Minister negotiations, the Cabinet authorizes the final Draft Budget around late December.

### Abolition of MOF's Draft and the Revival Negotiations

Until the formulation of FY2009 budget, following the guidelines for formulation of the budget, the Ministry of Finance (MOF) had finalized a draft of the Draft Budget each year, which was called as "Zaimu-sho gen-an," MOF's draft. It was presented to each ministry and final negotiations regarding the budget requests were held between MOF and each ministry for about 1 week on the basis of MOF's draft. These final negotiations were called revival negotiations, "fukkatsu sessho." Revival negotiations were held by several stages. The first stage was held at the official level, and continued by raising the class of officials, beginning at the division director class; next, director-general class; and next, vice minister. When there were matters which did not reach agreement by official level sessions, next were held between Ministers. If agreement was not reached here, next held was at political level, Ministers and the executive members of the ruling party. After necessary adjustments to the MOF's draft through the revival negotiations, the Draft Budget was approved and finalized by the Cabinet usually near the end of December.

Once, especially until 1980s, revival negotiations were regarded as a climax of budget formulation. People paid much attention to this process, and media, newspapers, and television networks provided wide coverage to the revival negotiations. Campbell expressed the revival negotiations as high drama (Campbell 1977, p. 198). However, at the formulation of FY2009 budget, the revival negotiations were abolished by the order of Prime Minister Aso; instead, the Minister negotiation was held just before completing the MOF's draft. Continuously, at the formulation of FY2010 budget, the MOF's draft was abolished by the Hatoyama Cabinet. Abolition of MOF's draft and the revival negotiations are parts of the reform, which pass the control over budget formulation process from the Ministry of Finance to the Cabinet.

### Establishment of the Council on Economic and Fiscal Policy

It had been criticized in Japan that bureaucrats had taken control of budget making, drafting government policies and bills instead of politicians. Especially, the lack of leadership of the Prime Minister in the Cabinet had been under criticism. In case of budget making, despite the Constitution stipulates the Cabinet makes and submits the budget, in realty, the officers of the Ministry of Finance had been regarded as the real budget maker.

To change such situations and to strengthen the administrative leadership of the Cabinet and the Prime Minister, the central government reform was executed by the Hashimoto Cabinet. On January 6th 2001, simultaneous to the

reorganization of the Japanese Central Government, which is well-known as restructuring of national administrative organs, under which the Prime Minister's Office and 22 Ministries were reorganized into the Cabinet Office and 12 Ministries by realigning the roles of the government, the Council on Economic and Fiscal Policy (CEFP) was established to support the Prime Minister in exerting its leadership. The CEFP is composed of senior ministers including the Prime Minister as a chair and Chief Cabinet Secretary, Minister of State for economic and fiscal policy, and authority on economics, business executives. The CEPT is expected to decide the basic framework of the budget, including priority areas and policies, and to make each ministry prepare the budget request and Ministry of Finance draft the budget in accordance with the ideal the CEPT shows (Ministry of Finance 2004, p. 11).

The CEFP has exerted a fairly big influence on budget formulation since its establishment, except 3 years from 2009 to 2012 while the Democratic Party of Japan (DPJ) had in power; the National Policy Unit established by the DPJ Administration took the place of CEFP. the so-called "Honebuto-no-houshin," large-boned principle by literal translation, made each year version by the CEFP and approved by the Cabinet in every June annually, has been regarded as a basic policy for the budget formulation. Following the Honebuto-no-houshin, CEFP issues the overview of the budget, "Yosan-no-zentaizou," which applies the Honebuto into the budget formation each year in July. Until CEFP was established, the guidelines for budget requests had been drawn up mainly by the Ministry of Finance; instead, since 2001, it has been drawn up in accordance with the Honebuto-no-houshin CEFP makes. Especially, two prime ministers, Jun-ichiro Koizumi and Shinzo Abe, both as a chair of CEFP, are acknowledged as well-utilized it in exerting leadership in budget formulation. CEFP has enabled cabinet-led budget formulation.

## The Diet (Parliament) Stage

The Cabinet submits the Draft Budget to the Diet at the beginning of the ordinary session. The ordinary session of the Diet is convoked in January. The budget bill can only be initiated by the Cabinet. The Diet is composed of the two Houses: the House of Representatives and the House of Councillors. According to the Constitution of Japan, the House of Representatives is given priority over deliberation on the Draft Budget.

After the submission of the Draft Budget to the House of the Representatives, the Minister of Finance outlines the Draft Budget and the government's fiscal policies in budget speech. This speech is called financial address. Financial address is one of the four speeches of administrative policies by cabinet members which are done at the beginning of the ordinary session of the Diet: policy speech by the Prime Minister, foreign policy address by the Foreign Minister, and economic policy address by Minister of State for Economic and Fiscal Policy.

In the House of Representatives, the Draft Budget is deliberated by the Committee on Budget. When the budget is referred to the Committee on Budget, the Committee may request the presence of the Prime Minister and other Ministers of State. During the deliberation, the opening of public hearings is required. Since the budget proceedings frequently provide opportunities for criticizing the administration for opposition parties, the Committee on Budget is the most popular committee in each House with the largest number of members composed.

After approval by the Committee by majority vote, the Draft Budget is put to a vote at a plenary session of the House of Representatives. After approval by the House of Representatives by majority vote, the Draft Budget is sent to the House of Councillors. In the House of Councillors, the Minister of Finance makes financial address, along with other speeches as well as in the House of Representatives.

In the House of Councillors, the Committee on Budget holds deliberations in the same manner as in the House of Representatives. Likewise, the Committee sends the Draft Budget to a plenary session of the House of Councillors after approval. Following its passage in the House of Councillors, the Budget becomes effective on April 1st, the beginning of a fiscal year.

## The Difference Between the Budget and the Bill

Both budget and bill are submitted and deliberated in the Diet. But, the House of Representatives is given priority over deliberation on the Draft Budget. On the contrary, the bill can be submitted and deliberated in the House of Councillors prior to the House of Representatives, or vice versa.

A bill becomes a law when passed by both Houses. But despite the House of Representatives passes a bill, when the House of Councillors makes a decision different from that of the House of Representatives, a Conference Committee comprised of selected members from both Houses can be convened to enter into the reconciliation process.

This Conference Committee of both Houses is called "ryo-in kyougi-kai." If the Conference Committee cannot come to common conclusion, or if the House of Councillors does not make a final resolution within 60 days after the receipt of a bill approved by the House of Representatives, a bill can become a law when passed a second time by the House of Representatives by a majority of two-thirds or more of the members present. And usually, since two-thirds vote is difficult to obtain, it is hard for a bill to become a law.

In case of the budget, when the decision of the House of Councillors differs from that of the House of Representatives, the Conference Committee of both Houses must be convened. Unlike in case of law, the opening of the Conference Committee is mandatory. If the Conference Committee cannot come to an agreement, or if the House of Councillors does not make a final resolution within 30 days, the conclusion made by the House of Representatives shall be that of the entire Diet. The Draft Budget can be a budget by the approval of the House of Representatives without the approval of the House of Councillors (Ministry of Finance 2004, p. 15).

This term, 30 days, is shorter than that of the bill, 60 days, which the conclusion made by the House of Representatives shall be that of the entire Diet. Namely, a Draft Budget can become a budget relatively easier than a bill becomes a law. It is because a budget can be effective for only 1 year; conversely, a law can be effective eternally once it is made, unless it is abolished by another law.

The Constitution guarantees superior position of the House of Representatives in budget deliberations like this way for the purpose of facilitating budget deliberations so that government activity will not be jeopardized due to the delay of the budgetary process.

## Conclusion

In this chapter, the budget formulation process of Japan's national government has been introduced. What is of most importance in budget formulation process would be to establish financial democracy in its process. In Japan, the Ministry of Finance has been under criticism as a main culprit of bureaucrats-led budget formulation. To tackle with this problem, several efforts have been made by shifting the power from the MOF to politicians. They have succeeded in some points: making budget formulation more transparent and setting priorities in budget allocation. However, they have failed in curtailing government spending, halting the expansion of budget deficits and government debt, which might impose the burden on future generations. With the absence of any legislative measures to cut the budget deficits, efforts to establish financial democracy in the budgetary process are still on the way.

# Budget Office

Usman W. Chohan
UNSW Canberra, Business School, University of New South Wales, Canberra, Australia

## Synonyms

Congressional Budget Office; Fiscal Council; Independent Fiscal Institution; Legislative Budget Office; Parliamentary Budget Office

## Definition

1. Legislative Budget Office (LBO): an office of economists and budget experts that is attached to, but separate from, the legislature. It has a mandate to provide impartial analysis of important fiscal matters relevant to current and future budgets. This term is the most frequently used, particularly in governance, public administration, and political science literature.
2. Independent Fiscal Institution (IFI): a term nearly synonymous with LBO, but with a wider remit, because IFIs may be attached to institutions other than legislatures, such as the audit office (France, Finland), or to no institution at all (Belgium). This term is more commonly used in the economic literature.
3. Congressional Budget Office (CBO): a subset of LBOs in countries with congressional political systems, such as the United States.
4. Parliamentary Budget Office (PBO): a subset of LBOs in countries with parliamentary political systems, such as Canada and Australia.

## Introduction

The budget is an inherently complex and obtuse document. This is because it is often very large, constituted of numerous moving parts, and underpinned by many economic assumptions and political predilections. It is also susceptible to intrusion from vested interests that are not always immediately evident, and is usually the product of a process of negotiation that has evolved over a long period of time. These elements make budgets difficult to grasp without the help of economic expertise, which is why *budget offices* are created to facilitate a greater understanding of what is an erstwhile intimidating and inaccessible document.

In the broadest sense, budget offices are institutions tasked with providing various forms of fiscal analysis. This may include duties such as (Chohan and Jacobs 2017) providing forecasts for economic variables over various time-horizons (Chohan and Jacobs 2016), analyzing how the government is taxing and spending public money, and (Joyce 2011) providing estimates of the costs associated with specific government policies ("costing"). In some countries, budget offices are given a very broad mandate, while in other countries they may be tasked with very specialized duties. The decision about what roles are to be ascribed to a budget office is often a product of the specific political and economic circumstances in which the office is conceived. However, the roles of a budget office are also normally influenced by international best practices, at least to some degree. These best practices have been prepared and honed over several decades by international institutions such as the OECD, the World Bank, and the IMF, among others. This is particularly true for budget offices that are now being created in developing and emerging countries.

There are at least three rationales for instituting a budget office, and each emerges from a different discipline: economics, political science, and governance. The **economic** rationale for a budget office stems from the need to address a long-standing concern about the ballooning debt and deficit levels of countries around the world, which are unsustainable and potentially calamitous. This concern was made all too evident after the economic crisis of 2008, which is incidentally why so many budget offices were created in its immediate wake (Kopits 2013). The problem of swelling debts and deficits emerges from the notion of *intertemporal consumption*, which stipulates that

if the current generation will consume an amount greater than what it can pay for at the present time, it will incur debts that will need to be repaid by a future generation, which will in turn reduce the consumption of that future generation. Without an expert institution such as a budget office to study and warn against the unsustainable incurrence of debt, there will be insufficient pressure for current consumption to be mitigated, particularly in terms of the *ways in which* it can be controlled or reduced.

The **political science** rationale for a budget office arises from the study of the relative power that different institutions have over the budget process, which is to say, over the decision to allocate society's resources. Typically, budget offices are proposed as a mechanism for supporting legislatures due to the pressing need of legislators for economic expertise, which they often do not themselves possess. Lacking budgetary acumen, legislators are usually at a disadvantage to the executive branch, which usually controls budget machinery such as the Treasury or the Department of Finance. This can lead to a diminished role for the legislature in the budget process, and thus to a reduced voice for electoral constituents, as well as a truncated ability of the legislature to play an oversight role in the budget process.

The **governance** rationale for a budget office stems from the proposition that countries, and developing countries in particular, need to build strong mechanisms for accountability, which will foster a governance environment that is more participatory, which can in turn boost economic growth and distribute the fruits of that growth in a more inclusive manner. Budget offices are thought to be a particularly effective institution for boosting accountability and transparency in the budget process, because they can be designed to produce independent and impartial economic analysis that is extensive and rigorous. This helps to hold other agents in the budget process to account, and makes the complex nature of the budget more accessible (transparent) to all stakeholders.

There are at least two other disciplines that are also beginning to take an interest in budget offices, namely **accounting** and **public administration**. The emergent accounting rationale for budget offices stems from their ability to "mobilize accounting," which is to say, rigorous numbers-based analysis, to serve social goals. The emergent public administration rationale stems from the "politics-administration dichotomy," which studies the role that public managers can or should play in the political sphere. Through their impartial and rigorous analysis, budget offices provide an example of reconciliation of the dichotomy because they are offices staffed by public managers that serve in the budgeting process that is by its very nature a political enterprise; and they enhance both "efficiency" in terms of analytical accuracy, but also enhance "democracy" by making the budget more accessible to stakeholders (Chohan 2017).

Given the various perspectives that can justify the instatement of a budget office, it is not surprising that their numbers are increasing around the world. That said, budget offices diverge tremendously in shape, size, scope, and mandate. This makes effective comparisons between them quite difficult. As an example, the Congressional Budget Office (CBO) of the United States has a multimillion dollar budget, strong legal and functional independence, as well as the largest number of economists of any federal agency, second only to the Federal Reserve. By contrast, the budget offices of several developing countries are housed in ramshackle conditions and accorded paltry resources to fulfill what is an erstwhile important task. Most budget offices are found between these two extremes, with somewhat meager resource endowments that hard-working budget office staff must make the most of as they navigate a complex economic and political space.

In terms of design, budget offices are usually attached to a larger institution, which in many cases is the legislature, whether congressional or parliamentary, and are then known as **Legislative Budget Offices** (LBOs). However, in some countries, such as Finland and France, the budget office is appended to the audit institution. In a few cases, such as Belgium's High Council of Finance, the office is not appended to any institution at all.

Given that they can come in various forms, the broad term that economists use for budget offices is "**Independent Fiscal Institution**" (IFI), and this term in turn reflects the need for *independence* in the structure and the mandate of a budget office. In other words, despite being attached to a larger institution, most budget offices are conferred a degree of statutory independence from the institution to which they are affixed. This is done so that the budget office is allowed to conduct its analytical work without direct intrusion or pressure.

As they appear in their current form, budget offices were conceived in the latter part of the twentieth century, with the first national-level LBO being founded in the 1974 in Washington, DC, as the **Congressional Budget Office** (CBO). Since then, other countries adopted similar models for their local contexts, with congressional systems such as those in Latin America and the Philippines acting as early adopters. After the 2008 crisis, many countries in Europe (most Eurogroup members), Africa (e.g., South Africa), and Oceania (specifically Australia) began to consider and then implement budget offices. Today, the large majority of OECD countries have an institution akin to a budget office, while developing countries are quickly following suit. Furthermore, subnational jurisdictions are also implementing LBOs for their local budgetary requirements, such as New South Wales, Australia, and Ontario, Canada.

## Requirements for Effective Budget Offices

In order to succeed in its mission of providing rigorous budgetary analysis that facilitates the fiscal understanding of its stakeholders, a budget office requires several essential ingredients, without which it is left vulnerable to varying degrees of risk. The ingredients that a budget office requires include resources and mechanisms both tangible and intangible. Some require a greater urgency in fulfillment than others. They are enumerated in Table 1.

**Budget Office, Table 1** Requirements for effective budget offices

| Requirement | Description and example |
|---|---|
| Statutory independence | An LBO must be able to exercise a degree of independence from its affixed institution to avoid pressure and recrimination. Example: the PBO of Canada is not an independent "Officer of Parliament" and has therefore faced tremendous reprisals from the government in the past |
| Legitimacy from political Stakeholders | An LBO must be accorded a degree of legitimacy to function as a participant in the budget process. Example: many Congressmen in the United States do not even start debating a policy until they first have it costed by the Congressional Budget Office; such is the legitimacy and standing of that institution. |
| Open publishing capacity | An LBO must be able to disseminate its findings widely in order to enhance budget transparency. Example: the PBO of Canada has adopted an open-publishing approach and thus brought many important and controversial government policies to light, e.g., the war in Afghanistan and the procurement of fighter jets |
| Able leadership | LBOs must be headed by men and women of integrity and nonpartisan dedication to economic rigor. Examples abound of able leadership: Directors Rivlin, Elmendorf, Orszag in American CBO; Kevin Page in Canadian PBO; Phil Bowen in Australian PBO |
| Sufficient funding | LBOs must be given sufficient funding to function as effective offices. Examples: when the Canadian PBO costed policies that displeased the government, it threatened to cut the office's funding by half |
| Competent staffing | LBOs must have competent staff to execute the actual work of budget analysis. Example: the Australian PBO has a large office of budget experts, but also brings able staff from |

(continued)

**Budget Office, Table 1** (continued)

| Requirement | Description and example |
|---|---|
| | Treasury or Department of Finance on a secondment-basis, and also resorts to external consultants on a needs-basis |
| Internal controls | LBOs must have internal controls so that corruption is not practiced within the institution itself. Example: the head of the PBO of Uganda was charged in 2015 on three counts including embezzlement, false accounting, and abuse of office; a situation made possible by weak internal controls |
| Access to information | LBOs require access to information that is relevant to their budget tasks, but often this information may be in the hands of another department, which may refuse to divulge it under a variety of pretexts. Nonetheless, many LBOs are adept at using indirect analytical methods to study complex issues when information is not forthcoming |
| Relationships with key departments | LBOs must navigate a sensitive political environment tactfully because they are often less powerful than other departments. As such, they need to develop working relationships with other departments. Example: in Australia, the PBO has signed Memoranda of Understanding (MoUs) with departments to help assure their cooperation |
| Relationships with budget offices abroad | LBOs, particularly new or very small ones, can gain much from the guidance and mentorship of larger and better-established budget offices. Example: international associations such as the *Global Network of Parliamentary Budget Offices* help foster such mentorship relationships |
| Legal protection | LBOs require protection that is enshrined in law, including: a high barrier to dismissing LBO staff, a firm and clear position in the budget process, and legal recourse in situations where its work is stifled or its existence is threatened. Example: the PBO of Australia is situated within a law known as the *Charter of Budget Honesty*, which provides clarity on its roles, as well as legal protections for the office |
| External evaluation | LBOs must themselves be held accountable in a nonpolitical and expert manner, which is why external independent reviews are strongly recommended. Example: in Australia, a periodic independent review is conducted by external experts to assess the conformity of the PBO with its stipulated goals |

## Dangers for Budget Offices

Budget offices are inherently fragile organizations, very much at the mercy of the larger political and macroeconomic undercurrents in which they must swim. This essentially leaves them mired in a defensive posture where, instead of advocating for the fulfillment of more requirements to make them effective, they find themselves simply focusing on remaining viable. There are four basic forms of danger that menace budget offices. The first, and mildest, is that an LBO may go largely **ignored** in the budget process, as is the case in some European countries. In such instances, whereas they are allowed to exist, budget offices find themselves relegated to a marginal presence in the wider budget architecture. Second, budget offices may be actively **stifled** by a branch of government (executive, legislature or the bureaucracy), whether through the cutting of their funds, reticence in providing them necessary information, or through the dismantling of their independent mandates, among other methods. All of these have been meted out upon the PBO of Canada in the not-too-distant past (Page 2015). Third, budget offices can be **disbanded**

altogether. A total shutdown has occurred in countries where a severe shock to the democratic equilibrium has occurred, with the two most notable instances of disbanded LBOs being Venezuela (1999) in the wake of the Chavez government's ascent to power, and Hungary (2010) soon after the rise of a far-right government which crippled many independent institutions including the nascent budget office. Fourth, an LBO can be **sabotaged** from within. This has happened in Uganda (2015) where the head of the budget office was charged on three counts including embezzlement, for which he is serving concurrent sentences at the time of this writing. In sum, budget offices face a host of threats to varying degrees, which adds a sizeable pressure to what is an already difficult objective: the maintenance of dispassionate, analytical rigor in studying a document as complex as the budget.

## Conclusion

Budget offices are widely recognized as an important tool for improving accountability and transparency in the budget process, and irrespective of the logic for their implementation (economic, political, governance, etc.), it is clear that their numbers are increasing around the world. This growth notwithstanding, there are still some questions that linger in the abstract about these offices.

First, it is important to ask whether budget offices are a *necessary* institution and whether some other mechanism isn't capable of performing a similar budget-accountability role. A fact that draws attention to this question is that the country with the highest-ranked level of budget transparency (2015), New Zealand, does *not* have the equivalent of a Legislative Budget Office or other Independent Fiscal Institution. Further to this point of necessity, the original system in which the Legislative Budget Office was conceived, the Congressional arrangement of the United States, is an exceptional design in itself, which is why its transposition into countries with other forms of government (parliamentary systems), different degrees of democratic participation (Venezuela), and different levels of socioeconomic development (Uganda) have been less successful than in the United States.

Second, it is worth pondering whether an institution, such a legislature, that is bolstered by a budget office, really should be a dominant player in the budget process. It must be noted that for much of the history of liberal democracies, the tacit understanding was that it was the *executive* who was to dominate the budget process, not the legislature. Scholars continue to debate whether a strong legislative role in the budget process is in fact a worthy objective, because whereas active legislative participation increases the level of electoral representation and budget oversight, excessive legislative involvement in the budget process tends to detract significantly from the efficiency of the budget process.

Finally, perhaps the greatest hindrance to a fuller acceptance of budget offices as institutions lies in the inherent difficulty of measuring what their "success" is. Scholars have begun to investigate the ways by which such an assessment may be made, including through comprehensive and independent external reviews, stakeholder surveys, modeling counterfactual economic situations, assessing the fiscal trajectory ex-post facto, and so forth. However, all of these methods suffer from inherent limitations.

These limitations notwithstanding, there is a general agreement among academics and practitioners that independent budget offices do provide "some form of good." As a result, budget offices continue to draw both academic and practitioner interest and are very likely to do so in the years to come.

# Budget Policy and Reconstruction in Iraq

Usman W. Chohan
UNSW Canberra, Business School, University of New South Wales, Canberra, ACT, Australia

## Introduction

Modern Iraq's budgetary history is characterized by the monopolization of decision-making by power structures that have not exhibited a sufficient commitment to transparency, accountability, general welfare, citizen participation, or the "fiscal liberation of the Iraqi people" (Chohan 2016: 101; Savage 2013). Despite having an endowment of natural resources, particularly oil, that is vast by any measure, that oil wealth has not been channeled toward the needs and aspirations of Iraq's citizens. Over the past decade, Iraq's oil industry has accounted for 40% of GDP but only 1% of employment (United Nations Iraq Joint Analysis Unit [UNIJAU] 2013), and tens of billions of dollars' worth of oil revenues, if not more, have been effectively squandered in not being diverted toward the general welfare of the Iraqi people.

The current challenges faced by budget reformers in Iraq are the product of a long history of convoluted and counterproductive acts, and they are not just relegated to the Saddam-era or earlier. As Chohan (2016) and Savage (2013) separately explain, the US invasion of Iraq in 2003, while ostensibly paving the way for a pro-democracy fiscal era, was mired in catastrophic failures and a largely anti-democratic approach to the budget process, one that is far different from the way in which the United States attempts to structure its own budget processes.

In other words, the approach toward budgeting that the United States has applied to itself is very different from that which it has propagated abroad. A stark example of this was in the *Future of Iraq Project*, which reflected the preinvasion American thinking and planning for Iraq, argued for the installment of an "Economic Czar" in the country to manage American interests (United States Department of State [USDS] 2002), a motion that is neither participatory nor particularly democratic.

Budget reform has been a crucial, albeit only partially understood, component of the reconstruction effort in Iraq. It has been argued that the Americans who planned the invasion and occupation strategy in Iraq "knew little or nothing about Iraqi budgetary institutions, their histories, or even their functions within the budgetary process" (Savage 2013: 25). In light of such issues, the purpose of this chapter is to present a historical background and delineate the budgetary and fiscal hardships for which Iraq's people continue to pay an exacting price and to draw lessons from this both in the context of Iraq and beyond (Table 1).

## Historical Evolution of Budgeting in Iraq

Savage (2013) has outlined the convoluted history of budgeting in Iraq under Ottoman, British, Hashemite, and Baathist rule, characterizing it as a "historical layering of institutions" that occurred as a result of "dramatic exogenous shocks" such as world wars, invasions, and foreign occupation (2013: 46). During their colonial regime, British forces attempted to model Iraq's budget system on that found in other Westminster-style colonial arrangements, and although the budget was the main focus of legislative preoccupation at the time, oil was not. In the early 1930s, oil royalties comprised only 0.3% of government revenues

**Budget Policy and Reconstruction in Iraq, Table 1** Chronology of the budget process in Iraq

| Period | Years | Budgetary events |
|---|---|---|
| Ottoman Rule | 1533–1918 | Economy managed variously through local appointees or directly from the Ottoman Porte, and majority of revenues diverted to Constantinople |
| British Mandate | 1920–1933 | Westminster-style political and legislative conventions instituted around the budget process<br>Strong fiscal position, minimal debt, and strong treasury balance sheet |
| Hashemite Kingdom | 1933–1958 | Codification of rules on budget, audit<br>Oil becomes important part of revenues<br>General fiscal position remains stable |
| Baathist Period and Saddam Hussein | 1968–2003 | Excessive secrecy, lack of transparency and accountability, budget becomes "state secret"<br>Priorities: centralization of power, rewards and patronage, economic nationalism<br>Shadow budget system and parallel hierarchy of decision-making<br>Climate of stress and uncertainty: Iran-Iraq War and Gulf War. Military-oriented budget<br>Lack of long- and short-term planning, resort to ad hoc fiscal maneuvers<br>Expenditures "without fiscal constraint" |
| American-led occupation | 2003–2007 | Lack of strategy and a poorly planned fiscal reform playbook, influenced by inexperienced and non-expert neoconservative ideologues<br>Intent does not match budget process in occupying countries' own context, e.g., anti-democratic suggestion to establish "'Economic Czar"<br>Most budget information destroyed, Ministry of Finance outside protected Green Zone<br>Coalition Provisional Authority (CPA) promulgates laws without accountability<br>CPA displays wanton corruption and ineptitude, fails to deliver on significant budget aspects<br>CPA withdraws and companies offered budget-related awards on contractual basis, most fail abjectly and subsequent audits disband or discard the projects |
| 2008–present | | Violence, sectarianism, uncertainty increase<br>Political squabbling and short-termism, frequent changes of finance ministers and officials<br>Budget reform-related contracts continue to be awarded to foreign companies, most fail to meet standards<br>Oil prices remain depressed<br>Tens of billions of dollars in lost oil revenues<br>Multilateral agencies continue to engage with stakeholders, remain optimistic |

Sources: Savage (2013), Chohan (2016)

(Iraqi Administrative Reports [IAR] 1992). This changed, however, in 1933, when the oil industry began to be developed and concomitant payments began to be made to the Iraqi treasury. At that time, Iraq had a very healthy balance sheet, with no floating debt, no capital debt, and a substantial treasury balance (IAR 1992).

In 1940, the Hashemite Monarchy began to codify budget rules in terms of budget preparation, government accounting rules, and auditing procedures (Savage 2013: 32). This structure was modeled on best practices found in Commonwealth countries at the time. With the rise of the Baathists in 1968 and Saddam Hussein in 1979, that responsible and stable budget process fell into disarray, and the economic priorities of "centralized political control, economic rewards and patronage to maintain regime support, and economic nationalism" took center stage (Savage 2013: 34). This in turn promoted a shadow budget system removed from the mainstream budget process and rested on a system of parallel hierarchical decision-making and extreme secrecy. Furthermore, a climate of stress and

uncertainty due to conflicts such as the Iran-Iraq War and the Gulf War nullified much of the long- and short-term planning ability of government machinery, which created a much more ad hoc and military-focused budgeting context.

By 1985, Saddam had promulgated several laws that transformed the budget into a state secret and completely disbanded the democratic, participatory, and transparent elements in budgeting. In fact, Saddam's regime began to act "without fiscal constraint," and oil revenues were used to prop up this rentier system (USDS 2002: 3). Savage has euphemistically described all this as "a distinct alternative to contemporary international best practices" (2013: 44).

## Occupation-Era Budgeting and American Failure

The general consensus among scholars is that the American planning for fiscal and budgetary reconstruction of Iraq following the toppling of Saddam was "woefully inadequate" and that the United States "went into the business of state building in Iraq reluctantly and ill-prepared" (Savage 2013: 47). This is somewhat counterintuitive, given that the "Washington Consensus" and the hardline neoliberal philosophy adopted by Bush administration ideologues ostensibly place a very high priority on budget reform, at least in theory (2016: 96). In practice, however, mishandling budget reform was one of the most staggering blunders of the American neoconservatives who claimed to "liberate" the Iraqi people, a fact made worse since many of the Coalition staff involved in this area comprised young, inexperienced neoconservatives who were unprepared for the mammoth task ahead.

Prior to the invasion of Iraq, the US Department of State conducted a largely abstract exercise in the delineation of fiscal objectives in a post-Saddam environment (USDS 2002). It made many recommendations characteristic of neoliberal regimes, such as low income taxes, higher consumption taxes, no export taxes (even as Iraq's largest export was oil), no customs duties (even though this had been the second largest source of government revenue), and no exemption on taxes for necessities such as food and medicine (USDS 2002).

Worse still, the Future of Iraq Project suggested that "the way to take advantage of the possibilities of harmonization and solidarity is for a post-Saddam regime to appoint an *Economic Czar* to coordinate the different measures advocated [here]" (USDS 2002: 36). It can be inferred from wording such as "an Economic Czar" that early American planning for Iraq's fiscal framework was sadly not tailored toward a participatory, nor even a particularly democratic, approach to budgeting. This is regrettable because the main external stakeholder in Iraq's reconstruction, the United States, could have seized that opportunity to bring core governance reforms, such as greater legislative participation in the budget process, to the fore, instead of designing anti-democratic arrangements for an occupied country.

Instead, the United States installed a *Coalition Provisional Authority* (CPA) as soon as its forces declared their invasion complete. The CPA was an unaccountable authority that engaged in severe mismanagement through various means (Office of the Special Inspector General for Iraq Reconstruction [SIGIR] 2005). The first budget that the CPA attempted to hash together in 2003 has been described by Allawi as an "amateurish and unrealistic affair, hastily put together by ministries that had no idea of modern budget preparation requirements, [. . .] and the old ways were kept going for the sake of expediency" (2005: 194). Budget promulgations by the CPA can be described as a mixed blessing, for while they attempted to institute basic measures, they failed to incorporate long-lasting and crucial fiscal reforms. Subsequent revelations of the CPA's gross mismanagement discredited much of the authority's budgetary credibility in any case, particularly in a figure of $8.8 billion that went unaccounted for (SIGIR 2005: 1). The CPA's lack of budgetary accountability and transparency, "ghost employees," inaccurate metering of oil production, and lapses in record-keeping of funds were just some of the problems highlighted in an alarming SIGIR audit, which also lamented that the CPA's budget effort was "burdened by inefficiencies and

poor management" (SIGIR 2005: 2). In sum, the American approach to Iraq was through the edicts of an unelected outside authority that was not accountable to anyone for its poor management.

## Aftermath of the Invasion

After the transfer of power to the Iraqis was nominally accomplished, there were three different governments in less than 3 years, which meant three different finance ministers came and "disrupted cohesive and comprehensive budgeting of any kind" (Savage 2013: 46). Even the primary attempt to implement a modern electronic budgeting system in Iraq, through a contract awarded to the consulting company BearingPoint to install financial management software, was halted, mismanaged, and ultimately deemed a failure (Savage 2013: 112–143). A crisis of insecurity, sectarian disharmony, and political instability only worsened the situation. It has been estimated that between 2004 and 2006, Iraq had $24.6 billion in lost oil revenues (Savage 2013: 149). The little progress that had been achieved during the years of occupation began to recede, and by 2011, the budgetary situation was as bad as in the immediate fallout of the invasion.

The tense security situation in Iraq, combined with dwindling oil prices in 2014 and 2015, meant that the strains in the budget process were getting much worse. Further programs to address budget reforms, such as a legislative strengthening program in 2008, were grossly mishandled and largely deemed failures; and the reasons for this lack of success have been attributed both to foreign and local stakeholders, their lack of cooperation, and their lack of commitment to see meaningful reform through (United States Agency for International Development [USAID] 2011). However, despite such a long list of setbacks and failures seen before, during, and after foreign occupation, it must be noted that both internal and external stakeholders have not lost hope and continue to consider ways in which the budgetary architecture and fiscal processes of Iraq can indeed be reformed (UNIJAU 2013). Nonetheless, scholars and practitioners alike note that it will be a long road ahead.

## Conclusion

The history of budgeting in modern Iraq is fraught with convoluted and counterproductive acts, as well as exogenous and endogenous challenges. Despite the claims of American occupying forces, much of their planning for Iraq's fiscal structures did not reflect their own fiscal beliefs or practice. In light of the American planning documents vis-à-vis Iraqi occupation and reconstruction (USDS 2002), the case of Iraq should be highlighted in the discourse on foreign interventionism in the twenty-first century, as an example of the incoherence between the exacting standards of accountability that liberal democracies demand for themselves, as opposed to the undemocratic arrangements that they would seek to install in occupied countries. Furthermore, as Savage categorically states, "The United States simply does not manage money well when the solution to difficult problems rests with spending large amounts of money quickly to achieve strategic military and political goals" (2013: 109).

While instability continues to wreak havoc across the country and oil prices continue to stay at comparatively low levels as of this writing, it is incumbent upon both scholars and practitioners to consider sustainable, participatory, democratic, transparent, and accountable mechanisms for rebuilding Iraq's fiscal processes; ones that are not premised on hardline economic ideologies such as those espoused by the Bush administration officials (Allawi 2007).

Future research must go beyond highlighting the problems in Iraq's fiscal architecture toward articulating meaningful solutions. For example, Chohan (2016) suggests that mechanisms such as *Legislative Budget Offices* can to help ground the budgetary process in a more accountable framework and also suggests that greater legislative oversight of the budget process is needed to shift the fiscal impetus away from the executive branch. Such solutions only mirror the architecture found

in the local contexts of the countries that occupied Iraq in the first place. This is perhaps the most resounding conclusion in the study of Iraq's budget policy and reconstruction: that those agents who wish to espouse reform in other countries must not engage in double standards, and as the old refrain suggests, "wish for others what they would wish for themselves." Iraq continues to possess great natural and human wealth, and robust budget reforms can indeed help her to realize a fiscal liberation for her people.

Budgetary incrementalism; Punctuated equilibria and budget; Theories of the budgetary process

## Definitions

Due to constraints during the decision-making process, shifts in policies are gradual. However, a breach in the policy monopoly and long-term inattention and overreaction to an issue lead to large-scale policy changes at specific times. These patterns of incremental or large-scale change in policies could be measured in terms of budget allocations in different sectors.

## Introduction

Governments prepare annual budgets allocating available financial resources to different policy domains to promote the wellbeing of their citizens. The actual amounts allocated to different sectors are determined by the governments' intentions and attention toward such sectors, as reflected in the respective field of public policies. Additionally, democratic governments show a willingness to accommodate the diverse needs, demands, and interests of multiple competing groups during the budgetary process, which results in significant year-to-year changes (not limiting a constant allocation over time) in such

budget allocations in particular sectors. Theories of the budgetary process, including incrementalism (Lindblom 1959; Wildavsky 1964) and punctuated equilibrium (Baumgartner and Jones 1993), offer plausible explanations for such changes in budget appropriations in respective budget functions over time. This chapter highlights the theories of incrementalism and punctuated equilibrium in budgetary process and introduces the typology in budget punctuations.

## Incrementalism in the Budgetary Process

Annual budgetary decision-making processes can broadly be categorized into "traditional (incrementalism)" or "reform" perspectives. The arguments in the reform perspective suggest that annual budget appropriations are determined rationally and comprehensively via an analysis of an abundance of information related to the issues. Zero-based and performance budgeting approaches are examples that focus on activities and their outcomes rather than on budget line items (Brusca and Labrador 2016). These budget appropriation approaches require a large amount of information and technical calculations to analyze the possible outcomes of allocations to particular sectors.

Compared with the "reform" perspective, scholars of the traditional perspective argue that budgetary decision-making cannot be rational and comprehensive due to time, resource, and information constraints; in contrast, budgetary decision-making is incremental. Beyond the managerial judgments of the decision makers, the budgetary process involves interactions among a number of stakeholders of diverse and conflicting issues across diverse policy subsystems. Bureaucrats, legislatures, interest/pressure groups, and other budgetary actors interact and negotiate to reach an annual marginal change. Competition and bargaining among these actors result in negotiated and adjusted choices, and gradual changes in policies are eventually reflected as minor changes in the budget appropriations to particular sectors (Bailey and O'Connor 1975; Lindblom 1959).

"The Politics of the Budgetary Process" by Aron Wildavsky (1964) represents a classic work, and in the fourth edition (1984), it states that "Traditional budgeting makes calculations easy precisely because it is not comprehensive. History provides a strong base on which to rest a case" (Wildavsky 1984, p. 221). In general, the budgets for each item are reported incrementally every year. Even in formulating and designing a new campaign or funding in situations of crisis, decision makers rely on previous experiences and similar existing solutions.

Bureaucrats are supposed to be equipped with information and knowledge for analyzing issues, and they participate as key actors in the budgetary process. However, according to Lindblom (1959), these officials choose to make small changes in policies instead of comprehensively analyzing the issues and making radical changes. Bureaucrats possess very limited information about the problems and their causes, and the skills they are trained with to solve those problems are limited. Due to these cognitive limitations and information and time constraints, bureaucrats prefer incremental decision-making, which is mainly based on previous actions and results achieved regarding similar problems rather than analyzing issues comprehensively and rationally (Birkland 2015). Moreover, due to political control in the public sphere, Swain and Reed (2010) argued that public officials tend to propose politically appealing and predominant agendas for budget allocation and implementation that are less likely to incorporate rational and technically competent "reform" agendas.

Wildavsky (1964) contributed to establishing a practical approach to incrementalism in the public budgetary decision-making process. This scholar, along with Davis et al. (1966), utilized the following model of budgetary changes to empirically analyze the dynamics of the US federal budget based on samples from 56 agencies from 1947 to 1963:

$$y_t = \alpha y_{t-1} + \epsilon_t$$

where $y_t$ and $y_{t-1}$ represent budget allocation in a particular budget function in the current year and the previous year, respectively. The parameter $\alpha$ represents the percentage change in the previous year's allocation, and $\epsilon_t$ represents an indefinite number of exogenous elements, such as stochastic disturbances, including wars, economic recessions, changes in majority in government, and the availability of resources.

## Punctuated Equilibrium in the Budgetary Process

Baumgartner and Jones (1993) embedded incrementalism into a new model to analyze the policy process in a more comprehensive manner, which is known as punctuated equilibrium theory. The authors exhibited the idea differently in the policy process models that emphasized "stability, rules, incremental adjustment and gridlock" and suggested that "policy change is not always predictable." These authors observed frequent unexpected changes in policies and noted that the changes are "disjointed and episodic" (Jones and Baumgartner 2012, p. 1). The usual continuation of marginal adjustments following incrementalism may breakdown at a certain time point. Long periods of policy stability are disrupted by significant changes, but such substantial changes occur infrequently.

Jones and Baumgartner (2012) listed two main factors that elucidate the discontinuous change dynamics. According to the authors, the cognitive abilities of decision makers allow them to focus on only a limited number of issues at a time, leading them to neglect other indefinite issues. Due to this serial processing and long-term inattention to a particular issue in the policy environment, the neglected issue worsens to a point at which decision makers are forcefully obliged to intensify their efforts and "overreact" to address the issue, thereby ensuring a significant shift in the particular policy. Another factor responsible for a significant shift in policy is "progressive institutional friction." When pressure for change accumulates in a political system and breaches the policy monopolistic status quo, a major policy reform occurs, and the budget allocations in such sectors breach the incremental trend. Such unpredicted and sudden significant changes in budget appropriations are defined as budget punctuations.

In support of the arguments provided by Jones and Baumgartner (2012), many scholars explained the reasons behind the punctuated equilibrium in particular policies. Breunig and Koski (2006) argued that political and institutional constraints lead to punctuation in policies, and the ideological distances between a ruling party and opposition parties can be observed in the punctuation. Similarly, budget punctuations in multiple budget functions can be observed if the budgetary authority projects significant changes in revenue and external grants compared to the previous year's projections (Guragain and Lim 2018). The government needs to address many issues, including issues that attract high levels of public attention and media coverage and other issues that may have little impact on the public arena but may involve international obligations. Media coverage amplifies public attention, and decision makers' prior obligations toward certain issues escalates attention to the issues, causing punctuations (John and Beven 2012). Budget punctuations do not always present similar patterns across all governments. Local government budgets are highly influenced by national-level economic and financial environments. Jordon (2003) argued that national grants have a substantial influence on local expenditure allocations.

To determine whether budget appropriations are punctuated, scholars have used different measures and criteria. The degree of incrementality is the general benchmark and an operational definition to identify punctuation. Wildavsky (1964) defines incremental change as a 10% average annual change in budget allocation compared with the previous year. Bailey and O'Connor (1975) and Danziger (1976) defined incrementality as only a positive change, whereas others included negative changes in the definition of incrementality. Baumgartner and Jones (1993) used a wider range of ±25% change compared

with the previous year to explain punctuation. Some scholars compared changes with the average annual change. Among them, Jordan (2003) defined 25% positive change and 35% negative change, compared to the average annual change, as the degree of incrementality. The change in allocation beyond such ranges is regarded as the budget punctuation. The use of histograms and kurtosis measures together with the test for normality are also common in many studies (Breunig and Koski 2006; Guragain and Lim 2018; Baumgartner and Jones 1993; Jones and Baumgartner 2012; Jordan 2003) to validate whether the budget appropriation data follow a nonnormal distribution pattern resulting in budget punctuations.

## Budget Punctuation Typologies

The government provides policy indications in its annual budgets, and the magnitudes of policy changes are reflected in the budget allocations for particular sectors. The annual budgets earmarked for certain sectors may follow incremental changes, or the budget allocations may deviate from the incremental change pattern. Several empirical studies have highlighted the occasional interruptions to static year-to-year increments in budget allocation for a specific budget function (Jones et al. 1998; Jordan 2003; Breunig and Koski 2006) but have rarely considered that such interruptions are conditioned to the constraints posed by macrobudgetary factors, including the availability of revenue. Considering revenue endogenous in allocating resources to different budget sectors, Guragain and Lim (2018) have illustrated the following budget punctuation types, creating more space in which to analyze the budgetary process based on the theory of punctuated equilibrium.

### Parallel Punctuation

The significant increment in the national treasury reharmonizes budget appropriations; as claimed by Heller (1975), "increases in tax revenue positively influence the expenditure categories" (p. 441). The increment will induce simultaneous budget punctuations in budget allocations across the policy sectors and can be defined as parallel budget punctuations.

As shown in Fig. 1, the changes at time points $t_1$, $t_2$, and $t_3$ follow the same pattern in all sectors. The significant reduction in revenue at time point $t_2$ leads to the simultaneous reduction in allocation in all sectors, and a significant increment in revenue at time point $t_3$ leads to the simultaneous increment in allocations.

### Sequential Punctuation

In a nominal revenue growth situation, the constraints of revenue in expenditure allocations allow decision makers to concentrate only on particular issues. Incremental or minor changes in revenue collection follow the transfer of punctuations sequentially across different sectors in budget appropriations.

Figure 2 also illustrates the shifts or transfers of punctuations from sector 3 to sector 2 at time point $t_2$ and sector 1 at time point $t_3$ under the condition of incremental changes in revenue.

### Complementary Punctuation

Budgetary actors with narrow roles in the budgetary process have a tendency to exhibit incremental changes in their agency's

**Budget Punctuations and Incrementalism, Fig. 1** Parallel punctuation

**Budget Punctuations and Incrementalism, Fig. 2** Sequential punctuation

**Budget Punctuations and Incrementalism, Fig. 3** Complementary punctuation

budget allocations (Berry 1990). However, the bureaucratic agencies at the field level prepare their budgets in isolation while considering only their own sectoral goals. Revenue is always inadequate to equalize the totality of the compilation of all agencies' budget requests. Therefore, budgetary trade-offs between the budgetary sectors are inevitable (Mogues 2012). The pattern of complementary relationships among the multiple budgetary domains exhibits complementary budget punctuations.

Complementary punctuation is depicted in Fig. 3. At time point $t_2$, the punctuation in allocation in sector 1 is complemented by a decreased allocation in sectors 2 and 3. The punctuation in sector 2 at time period $t_3$ is complemented by minor changes in sector 3 and rapid negative changes in sector 1.

## Conclusion

The theories of incrementalism and punctuated equilibrium explain the budgetary dynamics of government budget allocations. The theory of punctuated equilibrium is more practical and relevant for explaining the budgetary decision-making process in an inconsistent decision-making environment. An unstable political environment is the key factor that breaches the policy monopoly and status quo, which leads to an unpredictable policy shift in a particular budgetary domain. The availability of resources is also an endogenous factor in the budgetary decision-making process. Considering revenue endogenous in budgetary decision-making, different budget punctuation types – parallel, sequential, and complementary punctuations – explain the policy shift represented in a budget allocation.

# Budget Reform and Political Reform

Usman W. Chohan
UNSW Canberra, Business School, University of New South Wales, Canberra, ACT, Australia

## Synonyms

Accountability in the budget process; Budget discipline; Budget documentation; Fiscal rules; Political reform

## Definition

"Budget Reform and Political Reform" examines the political nature of the budget process, including the interplay between the agents in the budget exercise, and considers the difficulties and opportunities that the politicization of the budget process provides for conducting meaningful fiscal reform.

## Introduction

The budget is an inherently political enterprise. It is susceptible to intrusion from vested interests that are not always immediately evident and is usually the product of a process of negotiation that has evolved over a long period of time. While it may feign the semblance of a neutral process, the budget is the politically driven, subjectively oriented, "financial reflection of what the government intends to do" (Wildavsky 1961).

Therefore, "reforms" and other alternations in the budget process are often characterized by either overt political wrangling or at the very least by covert political machinations, as various agents in the budget architecture vie for greater power, attempting to steer any "reforms" in a propitious direction. This observation has not been lost on academics, as they have long noted that much of the literature on budgeting has dealt in some way with "reform" (Wildavsky 1961) and

that the budget is a quintessential "instrument of reform" (Willoughby 1918).

Furthermore, the fact that the budget is "political" also means that the budget can be "democratic," in the sense that democratized budget processes, involving the bargaining maneuvers of innumerable interests, are more representative and participatory, than budget processes which are "dictated from above," even while such non-democratic budget processes might be more efficient in a procedural and executional sense (Chohan and Jacobs 2017a, b).

In attempting to theorize budget reforms, approaches such as *rational institutionalism* and *historical institutionalism* have found that budget reform is either extremely difficult or quite nigh-on unfeasible (Meyers 2016). The impediments to executing meaningful budget reform appear either too cumbersome or at the very least highly dissuasive, leaving the process of actual reform substituted for incremental motions or simply rhetorical practice (see Chohan and Jacobs 2017b; Chohan 2017).

Yet budget reform is a problem of pressing consequence for many, if not most, societies; and it is no exaggeration to say that their very prosperity in future years hinges on their suppleness in fostering meaningful budget reform (Meyers 2016; Posner et al. 2012; Schick 2004). With this mind, the purpose of this chapter is to delineate some of the problems posed by the politicized nature of the budget process and then proceed to discuss solutions to engage in reform despite the political challenges of budgeting.

## The Political Problems of Budget Reform

There are philosophical, social, and material factors that influence the political problems of budget reform, which is why an ex ante enumeration is warranted (see Table 1).

Many if not most countries today appear to face three basic problems pertaining to the sustainability of their budgets (see also Chohan 2017). First, many budgets exhibit a persistent and continued reliance on borrowing to fund expenditures. Second, they exhibit an inability to withstand fiscal shocks or respond to fiscal crises. Third, they fail to exhibit sufficient transparency and accountability. These three problems have been made more evident since the Global Financial Crisis of 2008, which made the necessity for fiscal reform increasingly obvious to policymakers, but more importantly, it also gave them the political breathing-space to articulate their will to undertake reform (Chohan 2017). However, it is a very costly strategy for governments, and societies more broadly, to wait for crises to undertake budget reform (Meyers 2016; Posner et al. 2012; Schick 2004). That is because engaging in such undertakings from a position of weakness severely restrains both the magnitude and the directions of possible reform.

Furthermore, it is not clear that those societies which profess to be making budget reforms are actually doing so. A growing body of research (see review in Chohan and Jacobs 2017b) examines the "rhetorical aspect" of budget reform, wherein much of the initiative around budget reform is actually just politicians seizing on expedient mantras, without in fact engaging in the significant processes which may incur political costs (see Australian example in Chohan and Jacobs 2017b; Chohan 2017). Budget reforms may involve significant budget restraint, which may imply significant cuts to programs that voters or interest groups may want, which means in turn that political entities undertaking these reforms face a vehement political backlash. There is ultimately an ambiguity about whether citizens actually *want* budget reform. They may signal that they "value" budget reform to politicians, but they do so without accepting that this means restrained consumption, welfare, or expenditure for them. This speaks to a *problem of public value*, wherein citizens articulate contradictory and conflicting values between which politicians must adeptly prioritize (Chohan and Jacobs 2017b).

There is also a heightened polarization among political parties today in many countries, which makes the process of bargaining and negotiation over budget items far more difficult than in the past (Meyers 2016). Without recourse to compromise, strongly entrenched positions leave budget reformers with very little room to maneuver. In the United States, the polarization of political parties

**Budget Reform and Political Reform, Table 1** Political problems of budget reform

| Problem | Consideration |
|---|---|
| Persistent borrowing | Governments find themselves increasingly reliant on borrowing larger sums to fund more and more components of the budget. While borrowing may represent a prudent means of expanding and seizing economic opportunities, a persistent reliance on borrowing is likely to be unsustainable over an extended period of time and can lead to fiscal ruin if left unchecked |
| Inability to withstand shocks | The most reliable indicator of the fiscal health of a society is to examine its ability to withstand fiscal shocks and adequately respond to crises. As the budgets of more and more countries are saddled with debts and other constraints, their ability to respond to shocks has become severely diminished, as was made evident in the Global Financial Crisis of 2008, and this has increased the risk (as well as the cost) of future financial setbacks |
| Lack of transparency & accountability | In a strong democracy, the process of allocating resources through a budget should be reinforced through mechanisms of accountability and bolstered by a high level of transparency. The global level of transparency and accountability in budgeting is still very low, and mechanisms such as Legislative Budget Offices or Charters of Budget Honesty (Chohan and Jacobs 2017a; Chohan 2017) as well as fiscal rules (Posner et al. 2012) can help reduce the transparency and accountability deficits |
| Political will and waiting for crises | Many public institutions and governments cannot muster the political will to undertake meaningful reform, because the accompanying budget restraint may likely lead to political recrimination (loss of office, angry voters). This is why it appears that they wait for economic crises to articulate the need for serious reform, which is a risky strategy that incurs a steep price, as reforms must then be conducted from a position of weakness, if at all |
| Rhetorical aspect | A large proportion of what is described as "budget reform" may in fact be treated as the exercise of rhetoric, with politicians reverting to expedient mantras instead of swallowing the bitter pill of actual budgetary reform, and this rhetoric precludes the truly difficult project of restructuring the fiscal architecture |
| Subjectivity of targets | There is no universally accepted target for most fiscal parameters. Different political parties express different values and aspirations for fiscal variables, such as some preferring planned deficits while others preferring balanced budgets. This delves into the realm of political beliefs and philosophy, as opposed to any scientific process |
| Contradictory citizen values | Politicians may simply be unable to engage in fiscal reform because they are bound by the values of citizens which are conflicting and contradictory. On one hand, citizens may articulate the value of budget restraint, but on the other hand, they do not want this to detract from their actual welfare, consumption, or expenditure |
| Manipulative interest groups | The politicized nature of the budget process is often hijacked by manipulative interest groups which expropriate larger and larger amounts of the overall budget totals for single-issue purposes, and when taken in aggregate, it means that less compromise is possible and less of the budget is directed towards truly broad-based fiscal goals |
| Public and private debt | Countries which do demonstrate strong public debt management still find that their private debt levels balloon, often mathematically so, as private consumption fuels excessive borrowing, even while public budget appears well managed (e.g., Australia) |
| Polarization of political parties | The heightened polarization of political parties means that compromises are unlikely to be reached, and more radical measures (e.g., government shutdowns) are seen as easy recourse, instead of tackling the fundamental budgetary challenges. Such excess politicization detracts from the execution and implementation of sustainable budgeting |
| Rewarding coalition interests | More divided governments can work towards at least a degree of compromise, but a government highly united under a political party will find the budget reflecting a determination towards rewarding the ruling party's coalition of mobilized interests, which detracts significantly from budget reform |

over the past few decades now leads to annual threats (both rhetorical and actual) of shutting down the Federal government (Meyers 2016; Posner et al. 2012; Schick 2004).

Beyond this, there is a need to distinguish between the public and private debt of countries, because those countries that have been successful at public debt management have often seen a

bloating of their private debts. So while the government of a country may be stringent in its expenditure and borrowing, the private growth of debt can and often does compensate for that public restraint with binges in private borrowing. Even within the private sphere, there is a distinction to be made between citizens (voting individuals) and private interest groups. It has long been understood (see Wildavsky 1961) that interest groups can manipulate the politicized architecture of the budget process, but today that system is so categorically usurped by interest groups that budget reform is seen to be scarcely more than an adherence to interest group bargains (Meyers 2016), who may be insistent on little more than a single issue, on which they absolutely refuse to budge (Meyers 2016; Posner et al. 2012; Schick 2004). Further to this point, when a government is divided, there is a greater chance of arriving at political compromises (if negotiations are conducted adeptly), but when governments are mostly unified under a single political party, then the budget will reflect the party's resolve towards rewarding its mobilized coalition interests (Meyers 2016), which is to say that interest group manipulation is even more evident when government is dominated by one party.

All of this is circumscribed by a philosophical problem: that are simply different attitudes towards the architecture of budgeting, which differ in value judgments that cannot be repudiated or contradicted in any logical way (Wildavsky 1961; Chohan 2017). For example, some political parties prefer reasonable deficit spending, while others prefer to balance the budget. Such notions are subject to the philosophy of political agents rather than to any scientific measure. To this point, in creating ideal targets for budgeting that would somehow not be political, the most serious hurdle is that there is no universal target for sustainable budgets, deficits, or debt that would unanimously be agreed upon.

## Solutions to Push Budget Reform

With such a large number of challenges of a political nature weighing down on the budget process, it behooves both academics and practitioners, whether of a reformist persuasion or not, to consider solutions to budget reform that can be implemented in spite of the aforementioned difficulties. This section enumerates four sorts of solutions: fiscal rules, budget offices, bureaucratic initiative, and citizen budgets.

The first set of solutions can be described as **fiscal rules**, as these aim to establish binding rules that governments must continually adhere to. A fiscal rule may be as simple as a law that forces the government to maintain deficits (or other fiscal parameters) within a certain threshold. Another form of rule is known as a *balanced-budget requirement*, which stipulates the degree of balance that must be continually achieved on both sides of the budget equation. A more interesting and complex form of such imposition is a "Charter of Budget Honesty" which is a document that sets out the rules for how the government should conduct its budget process (see Australian example in Chohan 2017). While such rules have garnered increasing appeal around the world, they are subject to critical limitations. For example, as discussed above, there is an arbitrary element to targets set in such rules, premised on the divergent philosophies of political parties. If a government is beset with a deficit target of 40% of Gross Domestic Product (GDP), why not 50%? Why not 30%? Aside from the arbitrariness of fiscal rules, there is also an important question around the enforcement of such rules. How is noncompliance treated? What sorts of penalties are imposed, and by whom? In the European Union, countries that have failed to adhere to fiscal rules have not regularly been penalized, which weakens the legitimacy of such rules. As a final brief critique, it should be noted that fiscal rules reduce the flexibility of governments to respond to shocks. Budgeting is premised on a trade-off between discipline and flexibility, and while fiscal rules bolster discipline, they reduce government flexibility to a significant extent (Chohan 2017).

The second set of solutions revolve around **nonpartisan budget offices**, who act as an agent in depoliticizing (or more precisely, "apoliticizing") the budget process (Chohan and Jacobs 2017b). Budget offices are created to inform political agents about key matters pertaining to the budget. In the case of

legislatures, which are crucial to the budget process in democratic countries, it is a Legislative Budget Office (LBO) that is appended to, but independent from, the legislature (Chohan and Jacobs 2017a), with a mandate to engage in fiscal issues and provide dispassionate, nonpartisan analysis to legislators. These offices face intense resistance from politicians, but if conferred with sufficient legitimacy, resources, and expertise, LBOs can provide immense value towards addressing the political problems of budget reform, as they can develop long-term oriented, expert-driven approaches towards budgeting (see Chohan and Jacobs 2017a, b).

The third set of solutions revolve around what is known as **bureaucratic initiative**, which suggests a greater role for bureaucrats in lieu of politicians in driving the budget process. Such solutions have been put into place in the budgets of countries such as New Zealand, and have generally been perceived positively insofar as the efficiency (and even transparency, see Chohan 2017) of the budget process is concerned, since bureaucrats such as Treasury officials have drawn upon their fiscal and financial expertise to treat the budget as a comprehensive resource-allocation problem best managed by specialized institutions. However, they have been questioned in terms of the level of democratic input, which is to say the involvement of democratically elected political representatives in that exercise.

The fourth set of solutions relate to a somewhat new but well-regarded initiative known as a **citizen budget**, whose purpose is to educate the wider public about the key elements of the national or regional budget in a highly simplified and straightforward manner. A citizen budget highlights the core fiscal priorities of a government, provides visually clear and concise information, and provides citizens with summarized aspects of the budget. The goal of a citizen budget is to cultivate a more fiscally informed citizenry, and particularly so in regions where financial literacy is low. Citizen budgets are being implemented in developing countries quite proactively and yielding positive results in terms of engaging citizens in the otherwise remote and inaccessible budget process.

The aforementioned four sets of solutions are by no means exhaustive, but they present overarching categories that help typologize solutions that have garnered particularly keen attention from academics and practitioners in the past decade.

## Conclusion

It is not possible to disaggregate the political ambit from the budgetary ambit, as the budget represents the allocation of society's resources through a political process of negotiation. Given that politics is so inextricably embedded within the budget, there is a need to examine what sorts of reforms could be made in spite of "politics." Whereas this chapter has suggested certain sets of solutions towards that end, budgetary thinkers have long asserted that true budgetary reform is not possible without substantial political reform as well (Wildavsky 1961), and perhaps vice versa. Irrespective of their deep entrenchment, both political and budgetary reforms warrant heightened urgency because of the constraints that societies face as they embark on unsustainable trajectories, particularly in the fiscal realm. A growing reliance on borrowing, an inability to withstand shocks, and a lack of accountability in the budget process loom large as challenges for democratic societies to address, still attempting to draw lessons from the Global Financial Crisis of 2008, as they proceed towards more robust budgetary and political systems in the years to come.

# Budgetary Assistance for Crisis Management

Barbara L. Neuby
Department of Political Science and International Affairs, Kennesaw State University, Kennesaw, GA, USA

## Synonyms

Contingency planning; Disaster funding; Emergency management

## Introduction

Almost any event can be a crisis for a particular government or organization. All organizations are aware of common natural disasters: hurricanes, fires, floods, and other weather anomalies. All realize the dangers of terrorism and accidents but few specifically budget for these events. Governments and nonprofit agencies have emergency plans and contingency funds, the latter ranging from around 1% to 3% of their budgets and a few larger jurisdictions, like the City of New York, for example, have crisis budgets. State and local governments in the US devote portions of their budgets as revenue and politics allows, but nations devote even larger shares of their budgets to the security and emergency functions.

When disaster occurs, state, provincial, or local governments go it alone until or unless help arrives. While resources must be used to respond to the emergency, whatever the type, even a minor crisis can slice through the best-laid budget. The organization may not have the skills and capabilities to manage the crisis appropriately or the funds to provide them. Help may be needed and can take many forms. Direct funding, grants, education or expertise, free or affordable equipment, or financial options specific to their situation are all available. If contingency or emergency funds are consumed, governments and nonprofits also have a variety of in-house measures they may be able to take on their own that will decouple the budget from the emergency. Sometimes the assistance offered is instrumental in rescuing a budget because of what is not spent, because funds not expended on that crisis response can make the difference between surplus and deficit at the end of the fiscal year. The type of assistance is often particular to the type of crisis. A review of disasters and the types of assistance available are the subject of this essay.

## Crises

When we think about a crisis, we probably think about our own experience, of what has happened

to us. That is a somewhat narrow, but understandable, view. Governments and most organizations do not have that luxury but must consider all possible hazards. The US Department of Homeland Security and most national governments take an all-hazards approach. Studies have shown that terrorism is unpredictable, and weather or natural calamities, while some claim predictive power, often take us by surprise. Yet governments and nonprofits must be prepared for whatever comes their way.

## Natural Disasters

Hurricanes, floods, and wildfires are the most predictable emergencies. We usually have hours if not days' notice. Tornados, tsunamis, and earthquakes offer a mere few minutes of warning. Entire industries have been built around weather, climate, and public notification. Scales and indices like the Saffir-Simpson for hurricanes and the Fujita-Pearson for tornados measure intensity and warn of the size of the threat. Historical information about past threats is used as a guide by governments to plan future budget allocations for disasters. Organizations can plan and budget for a potential response commensurate with the level of threat based on the likeliness of the event and the scale of loss. As in real estate, sometimes disaster management and funding depend on location. It is all relative. Jurisdictions that fall on a coastline must be ready for hurricanes. Drought-stricken areas must incorporate wildfire management into their emergency budgets. Governments on a fault zone must consider earthquake response plans, while those near rivers must bargain for floods and so on.

Biological events are also nearly totally impossible to budget for because there are so many "unknowns." For starters, there are an untold number of viruses in the world, weaponized strains of bacteria, and unknown consequences of medical research. Governments and private organizations stockpile medical supplies. Hospitals buy backup power and conduct mass care drills. The 2014 Ebola outbreak severely challenged budgets worldwide, and the 2016 Zika virus threatens to do the same. Resource utilization must be coordinated between public and private sectors for the good of all (World Bank 2016). Mass care is enormously expensive.

## Man-Made Disasters

Terrorism is an increasingly likely event for which no budget can adequately prepare. Governments face potentially devastating losses. Security is costly and most often these costs are shared with partners or mitigated by external funders of one sort or another. Monitoring, response, and recovery form the basis of crisis budget operations. Water, sewer, and power systems form the critical infrastructure by which state and local communities run. Obligations to maintain them are shared with the private sector that generally owns most of this infrastructure (United States 2013). Attacks on a large enough scale will usually bring assistance from other governments, mainly the federal government and an outpouring of volunteer assistance as happened on 9/11.

In the wake of the November 13, 2015 Paris terror attack; the Brussels, Belgium attack on March 22, 2016; and the truck that plowed through the crowded streets of Nice, France on July 13, 2016, European country budgets, once diminished in the face of the austerity regimens imposed by the EU government, are now increased and planned for crisis management. French President Francois Hollande noted that security took precedence over financial stability, and the country has added 23,000 military positions devoted to anti-terrorism in a move that will stretch budgets once again (Alderman 2016). Germany has added to its police and intelligence forces to the tune of 130 billion Euros or $141 billion. Companies across the EU zone plan to spend up to 500 million Euros more for surveillance and response activities (Alderman 2016). Israel spends five times on security what other

EU nations spend, crowding out other priority expenditures (Bassok 2013).

Sometimes accidents happen and sometimes they are made to happen. A company is allowed to forgo safety testing of its deep-sea oil well and the well explodes. Mechanical failures occur and a valve sticks shut on a cooling system in a nuclear power plant and radiation is released. A string of malicious code is sent unwittingly throughout a computer system and everything downstream crashes. Today, with power, water, and sewer systems electronically and remotely controlled, cybercrime is an ever-present reality. Hackers are alive and well with thousands of breaches occurring since 2001, and cybersecurity professionals do not come cheap (Center for Strategic and International Studies 2015). Other than basic protection against malware, communities cannot afford to support larger efforts.

Closely related to the cybercrime issue is the potential for failure of the electric grids in every country. In the US as in many developing nations, the electric power grid is a patchwork of old and newer generating stations pieced together in a disordered and haphazard fashion. The system is often unstable and is rife with vulnerabilities. An electromagnetic pulse, whether natural or man made, could wipe out a region's or even a country's electric capacity for weeks or months. New transformers require months to build and are manufactured by private industry. Governments are charged with overseeing the effort.

A financial collapse is also possible; some in international financial circles say the world is suffering from financial turmoil due to the levels of global debt, deflation, and economic woe (Council on Foreign Relations 2013; Subacchi 2010). In the US, in 2008, the federal government authorized its central bank to print money to loan to shore up the nation's banking sector. Now, with one quadrillion worth of derivatives trading in financial markets, a financial house of cards needs only one card to be withdrawn. Such a precarious situation has few good solutions. Events like the "flash crash" of the US stock market on May 6, 2010 when the main index dropped 1000 points in 5 min (Treanor 2015) caused widespread panic. Globally, the International Monetary Fund (IMF) serves as a crisis manager for the world's governments through its 13 programs for forestalling financial Armageddon (Moghadam 2011). Currency crises, balance of payments, unemployment, refugee crises, and food insecurity could push the financial sector over the edge, and only a sovereign government can budget for these events.

Civil unrest could come about as a result of each of the aforementioned disasters if food and funds suddenly became unavailable. Events such as those above can challenge government crisis leaders to the maximum point. Financial disasters require vastly different resources and skills compared to those required in a hurricane or fire, for example.

How do governments plan for all these potential hazards? Where do governments and nonprofits get budget help when needed? What tools can they use to help themselves?

## External Assistance for Crises Management

### Funding

When people think about budgetary assistance that might be available in a crisis, federal grants easily come to mind as they are the greatest single source of budget help when disaster overwhelms state or local resources. With regard to security or emergency preparedness events, the Department of Homeland Security anti-terrorism grant distributes over $1 billion to state and local governments for training to support 32 core capabilities. For large cities, the Urban Areas Security Initiative offers millions in preparation and equipment. Mass transit security is funded at $87 million and emergency management at $350 million, all from the federal purse. The funds go directly to states that are then supposed to pass it through to the cities, yet cities complain they do not ever see the money and hire lobbyists to chase it down in

**Budgetary Assistance for Crisis Management, Table 1** Department of Homeland Security grant funding 2008–2016 (000,000 s)

| Grant name | Amount |
|---|---|
| State Homeland Security Program | $1770 |
| Operation Stonegarden (state, local, and tribal coordination) | $55 |
| Urban Areas Security Initiative (UASI) | $1940 |
| Transit | $87 |
| Port security | $100 |
| Nonprofit security | $13 |
| Emergency management | $350[a] |
| Total | $4315 |

[a]Emergency management funding for FY 2016. Other amounts in previous years (United States Department of Homeland Security (2016)

state offices (National League of Cities 2017; Eisinger 2006; Table 1).

It is not only terrorism or natural disasters for which grants are offered to state and local governments but also for domestic crises like drug epidemics and homelessness. As noted, crises are particular to each jurisdiction. In some areas, the homeless and drug-addicted population has reached the crisis stage, and local policies or state aids have not solved the problems. The Department of Housing and Urban Development (HUD) and Department of Health and Human Services (DHHS) have awarded over $2 billion to nonprofit, government, and faith-based groups to alleviate local emergent crises from 2008 to 2015 (U.S. Department of Health & Human Services 2016; U.S. Department of Housing and Urban Development 2014). Many other federal grant programs provide funding to manage crises.

Closely related to anti-terror or weather disaster funding is the military equipment giveaway program. The Federal Support for Local Law Enforcement Acquisition Program, better known as the "1033 Program," sells or gives Humvees, automatic rifles, electronic surveillance and communications gear, and riot control equipment to state and local law enforcement at bargain basement prices (10 United States Code, Sec 381 2015). After race-related unrest occurred in 2015 in major cities, President Obama ordered the defense department to take the military equipment back leaving sudden holes in the equipment list of law enforcement agencies all over the country (Obama 2015).

The Federal Emergency Management Agency (FEMA) operates a particular reimbursement program for nonprofit organizations that lose facilities or suffer other losses during and after a disaster. Lutheran Social Services, the North American Mission Board, Catholic Charities, and other community organizations offer valuable services to public during emergencies. Mass care, food, medicine, transportation, and grief counseling are just a few charitable goods they deliver to a public in need. The FEMA Public Assistance Program is very complex and contains many specific regulations regarding how a nonprofit can apply for reimbursement for losses sustained during the nonprofit's disaster response. A nonprofit that sustains a substantial loss of a building or equipment while performing emergency activities under the direction of FEMA can possibly recoup many of their large financial losses thereby saving their budget for current services (FEMA 2016).

The National Volunteer Organizations Active in Disaster (NVOAD) is a nationwide nonprofit coordinating group that helps faith-based and other volunteer organizations serve a public during a crisis. NVOAD saves government money by providing services so that the government does not have to. NVOAD includes groups like the Lutheran Social Services, the Salvation Army, the Red Cross, and Catholic Charities, whose members have been trained to offer mass care, feeding, shelter, and grief counseling. Topical and industry organizations like the National Emergency Management Association (NEMA), the International Emergency Management Association (IEMA), and the International City Management Association (ICMA) can also serve local and state governments by providing information, training, and connections to other similarly situated governments. In addition, states and cities make their own compacts for crisis response, called emergency management assistance compacts or "EMACs." Through these agreements they share equipment, personnel, and best

practices about crisis response. Sometimes they pool funds to be used by a member of the compact after the event. Industry groups like the National Electric Manufacturers Associations (NEMA) and CyberSecurityVentures.com offer governments the chance to work with the most up-to-date encryption and fraud detection equipment. They provide state-of-the-art technology to support all manner of government network security and, at times, at reduced rates for their service.

Any government that seeks budget assistance for crises should not overlook their respective lobby group. For US cities there are two: the National League of Cities and the US Conference of Mayors. For counties, it is the National Association of Counties and for states, the National Conference of State Legislatures and the National Governor's Association. These organizations have offices and lobbyists in Washington, DC and serve as vital pipelines to the best grant, funding, and assistance packages available. These groups bring governments together often in real time. At the state level, the Governor's Council brings state emergency managers together to discuss DHS grants, and a Grants Committee filters through the fine print to inform state officials of the quickest path to funding relief. States share stories about what worked well for them. The budget is always an issue and that which saves time and effort saves money. Recently, ICMA developed websites for governments to come together in real time and talk about proven methods to prevent cybercrime, accidents, and other disasters.

## Training and Education

The Federal Emergency Management Agency (FEMA) offers local governments and states training on the National Incident Management System, or "NIMS," and supplies educational materials and a forum for coordination with private owners of critical infrastructure. Without these aids, state and local governments would have to find other training, probably in the private sector, and pay for it out of their own source revenues. Although nominal fees are levied, NIMS training saves local governments millions of dollars a year and, perhaps more importantly, makes them eligible for federal grants.

Working closely with state and local governments to prevent and monitor financial crises is the federal Financial Crimes Enforcement Center or "FinCen" for short. Although the banking system is privately owned and operated, states, local governments, and nonprofits depend heavily on it to manage their financial affairs. States have agencies to oversee banks within their jurisdiction, but the state cannot afford and is ill equipped to serve in the role of watchdog of the entire system. Fraud, embezzlement, other white collar crimes, or system security poses serious risks to state and local financial operations and would be devastating to their budgets. FinCen is a subdivision of the Federal Bureau of Investigation and, through the Automated Clearing House (ACH) network, monitors money flows through all the banks in the Federal Reserve System. This is a function state, and local governments have no capacity to do but must count on the federal level to safeguard.

## In-House Solutions

Governments, whether federal, state, city, or county, are not bereft of money-saving methods. They have their options that include borrowing from a bank or financial institution, passing legislation to acquire new revenues, or reprogramming funds through a budget amendment to move money where it is needed most without resorting to higher taxes or fees. Public authorities can also be created to serve as a financial foundation and focal point for one or more particular crises. Such an example of this mechanism is the Exchange Stabilization Fund, created and run by the treasury department of the US government during the 2008–2009 fiscal crisis. New or higher user fees are also viable although unpalatable options.

Borrowing is the least palatable way of finding money to manage crises. Governments have two kinds of debt they can incur: general obligation, or "G.O." debt, and revenue bonds. There are more complex, less used, financial techniques but they are beyond the scope of this essay. General obligation debt is easier to acquire because it is backed

by the "full faith and credit" of the issuing government and usually pays the borrower a lower interest rate because it is safer than revenue debt that is not so supported. Because of the lack of government support, revenue bonds generally pay higher interest rate to the lender. Generally, to sell revenue bonds, a government or nonprofit must have an income-producing activity like a stadium or a water plant from which to charge fees then used to pay off the bonds. Crises do not fit this description but financial institutions will often sell these debt instruments for governments. One example is the pension-obligation bonds sold by the state of Illinois. Because the state has not funded its pension fund appropriately over the past 50 or so years, the liabilities of paying the retirees' pensions has outstripped the state budget's ability to support the obligation. As was noted earlier in the essay, a crisis is particular to the government who owns it. For Illinois, one crisis is the public pension system and the state has chosen, on several occasions, to borrow money from willing lenders to stave off a crisis so that pension checks can go out tomorrow (Moody's 2016). While this is not the best way to respond to a crisis, the state's leaders are trying to find a more manageable plan.

Governments can also reprogram funds from one department to another department where money is needed more. As most crises do not happen at opportune times, money is often not where it is needed immediately. If the legislative body has already passed the budget (usually a long-drawn-out affair between the executive and legislative branches) then major moves of funds require their permission. If a disaster occurs, often staff in a department will continue to render needed service even though they are technically out of funds to do so, knowing that a budget amendment will transfer monies later on after the legislature has signed off. Here, structure and process are important tools governments must put in place before a crisis happens. The right offices and personnel must be trained on the right techniques to adjust the budget. It is important that governments are able to respond quickly and appropriately. Failure to do so could result in greater financial trouble than a minor budget overrun.

## Conclusion

While it is true that governments face far more challenges to their budgets from a wider range of disasters and crises than ever before, it is also true that they have adapted by creating new funding solutions and reforming existing ones to meet the new threat. Governments and nonprofits have more resources on which to draw: financing from and sharing arrangements with other governments, help from volunteers and national organizations, and in-house financial techniques that are creatively employed to maintain budget stability.

# Budgetary Constraints

María-Dolores Guillamón
Department of Accounting and Finance, Faculty of Economics and Business, University of Murcia, Murcia, Spain

## Synonyms

Arrest; Captivity; Check; Circumscription; Clampdown; Confinement; Control; Cramp; Curb; Curtailment; Damper; Detention; Deterrent; Hampering; Handicap; Hindrance; Impediment; Limit; Limitation; Obstruction; Rein; Restraint; Restriction

## Definition of Budgetary Constraints

Most governments set some type of restriction on their public finances figures in an attempt to prevent the recurrence of the wave of defaults and excessive deficits and borrowing. The introduction of these constraints could be explained by the theory of fiscal illusion. Fiscal illusion might take five distinct forms: the complexity of the tax structure, renter illusion with respect to property taxation, income elasticity of the tax structure, debt illusion, and flypaper effect. In the case of debt illusion, which involves the choice between debt and tax finance, it is assumed that individuals are more likely to perceive the costs of public programs if they pay for them through current taxation than if tax liabilities are deferred through public-sector borrowing. From this perspective, politicians would prefer to increase the budget with debt-funded spending, rather than tax funded. Furthermore, if citizens tend to underestimate the future taxes necessary to service the deficit, then the marginal taxpayer resistance to higher spending is lower than it would be under budgetary balance. Therefore, a debt limit, on the one hand, enhances future taxes anticipation, and on the other hand it prevents governments from increasing debt beyond socially optimum levels.

Budgetary constraints can be classified into two groups: exogenous and endogenous. On the one hand, exogenous constraints include the rules, limits, and conditions imposed by international organizations and treaties (e.g., the Stability and Growth Pact for the European Union). Endogenous constraints are mainly at the national level and refer to the issue of the financing of public expenditure, in terms of taxation and deficits.

Different types of instruments can make these constraints operative. They range from trusting market mechanisms to establishing some internal control in the public sector. In this latter option, instruments can be limiting rules, coordination mechanisms, or central government's direct control tools. Furthermore, budgetary constraints may take two models: ex ante controls and ex post mechanisms for dealing with insolvency. On the

one hand, ex ante regulations include individual limits (e.g., the purpose, types, and procedures of borrowing) and permissions. On the other hand, ex post regulations aim to control the debt stock and the current budget for dealing with insolvency.

## Introduction

The impact of fiscal institutions on the level of government debt and deficits has attracted intense interest in both economics and political science. In fact, most countries apply restrictions to budgeting and borrowing. These restrictions vary according to the concrete limit applied, which in turn determines how strict the requirement is.

The aim of fiscal institutions is to constrain government officials' behavior. In fact, limits and rules are designed to curb government officials' fiscal decision-making. Thereby, voters use fiscal institutions to reduce their principal-agent flaw, i.e., the problem that arises when officials use taxes in ways that do not maximize voters' interests.

The reasons that justify the establishment of these limits can be summed up as follows:

(a) To promote intergenerational equity, i.e., to prevent nowadays population from getting in debt to enjoy services whose financial cost will be transferred to future taxpayers
(b) To sustain financial balance, i.e., revenues must cover expenses.
(c) To protect the solvency of governments and to protect bondholders.
(d) To avoid the bilking problem in debt financing, since if transmigrants can shift the debt burden onto the future residents, the former under-evaluates the cost of debt and thereby overissue debt.
(e) To reduce interest costs and to get higher credit ratings. Anti-deficit rules can affect the bond market's perception of the borrowing jurisdiction, and this way affects the required interest rate on outstanding debt.

In the framework of the European Union (EU), economic governance aims to detect, prevent, and correct problematic economic trends such as excessive government deficits or public debt levels, which can stunt growth and put economies at risk. Thus, all EU member states are committed under rules known as the Stability and Growth Pact (SGP) to pursuing sound public finances since they are an essential prerequisite for sustainable economic growth and financial stability.

## Types of Budgetary Constraints

There are four main types of budgetary constrains based on the type of budgetary variable that governments seek to constrain (Schaechter et al. 2012):

- Debt rules set an explicit limit or target for public debt in percent of GDP. This type of constrain is the most effective in terms of ensuring convergence to a debt target and is relatively easy to present.
- Budget balance rules constrain the variable that primarily influences the debt ratio and are largely under the control of policy makers. These rules can be specified as overall balance, structural or cyclically adjusted balance, and balance over the cycle.
- Expenditure rules set limits on total, primary, or current spending. Such limits are typically set in absolute terms or growth rates and occasionally in percent of GDP.
- Revenue rules set limits or floors on revenues and are aimed at boosting revenue collection and/or preventing an excessive tax burden.

Furthermore, governments also can establish constraints about the use of some resources for restricted aims. In this case, it is possible to distinguish between three kinds of funds: unrestricted (available for general use), temporarily restricted (these funds have a time or purpose restriction during a period of time), and permanently restricted (these funds are restricted for a time or purpose restriction that never expires).

## Budgetary Constraints in Europe: The European Stability and Growth Pact

The two principal treaties on which the EU is based are the Treaty on the Functioning of the European Union (TFEU) and the Treaty on European Union (TEU) (European Union 2012). The TFEU is based on the 1957 Treaty of Rome (European Union 1957) and was originally known as the "Treaty establishing the European Economic Community," but was renamed when the Treaty of Lisbon came into effect on 1 December 2009. The TFEU organizes the functioning of the European Union and determines the areas of, delimitation of, and arrangements for exercising its competences.

The TEU (European Union 1992), signed in Maastricht on 7 February 1992 (for this reason is also called Treaty of Maastricht), represents an important step in European integration since it opens the way to political integration, introduces the concept of European citizenship, reinforces the powers of the European Parliament, and launches the European economic and monetary union (EMU). Thus, the member states must ensure coordination of their economic policies, provide for multilateral surveillance of this coordination, and are subject to financial and budgetary discipline. The main objective of monetary policy is to create a single currency (the euro) and to ensure this currency's stability thanks to price stability and respect for the market economy.

There are five criteria set out by the TEU that must be met by European countries if they wish to adopt the euro:

1. Inflation of no more than 1.5 percentage points above the average rate of the three member states with the lowest inflation over the previous year.
2. The ratio of the annual government deficit to gross domestic product must not exceed 3% at the end of the preceding fiscal year. If not, it is at least required to reach a level close to 3%.
3. The ratio of gross government debt to GDP must not exceed 60% at the end of the preceding fiscal year. Even if the target cannot be achieved due to the specific conditions, the ratio must have sufficiently diminished and must be approaching the reference value at a satisfactory pace.
4. Long-term interest rates should be no more than two percentage points above the rate in the three member states with the lowest inflation over the previous year.
5. The national currency's exchange rate should have stayed within certain preset margins of fluctuation for 2 years prior to entry.

The stability of the EMU has been and remains one of the top concerns of their leaders. The SGP, enacted in 1997, is the legal framework that seeks to ensure sustainable public finances so as to contribute to the stability of the EMU (European Union 1997). It is an agreement that is to be applied to all member states of the EU and complements the creation of the EMU. It consists of two main building blocks: the corrective arm and the preventive arm. On the one hand, the corrective arm of the SGP governs the Excessive Deficit Procedure (EDP). The EDP is triggered by the deficit breaching the 3% of GDP threshold or the debt being above 60% of GDP. On the other hand, member states that are not subject to an EDP have to fulfill the provisions of the preventive arm of the SGP. Thus, it compiles a set of rules designed to ensure that countries in the EU pursue sound public finances and coordinate their fiscal policies. Each country has to set their budgetary target, known as a Medium-Term Budgetary Objective (MTO). In April of every year (preferably by mid-April and not later than 30 April), all EU member states present to the European Commission (EC) the budgetary measures that they intend to implement in order to fulfill their commitments. These targets take into consideration business cycle swings and are included in stability programs, in the case of EMU member states, or in convergence programs, for the other EU member states. At the same time, all EU member states also submit details of the structural reforms they are

planning to boost growth and jobs in "National Reform Programs." The European Commission analyzes the two programs of every country and then makes specific policy recommendations to each of them. Governments discuss these recommendations with the European Commission and with each other and then integrate them into their national policies with their parliaments. EU member states base their budgets on a set of commonly agreed priorities to address economic risks and challenges detected by the EC.

The EC monitors the development of the budgetary situation and of the stock of government debt in the member states with a view to identifying gross errors. According to the TFEU, the EC examines compliance with budgetary discipline on the basis of the following two criteria:

1. Whether the ratio of the planned or actual government deficit to gross domestic product exceeds a reference value, unless either the ratio has declined substantially and continuously and reached a level that comes close to the reference value or, alternatively, the excess over the reference value is only exceptional and temporary and the ratio remains close to the reference value
2. Whether the ratio of government debt to gross domestic product exceeds a reference value, unless the ratio is sufficiently diminishing and approaching the reference value at a satisfactory pace

Countries that fail to respect the SGP's preventive or corrective rules may ultimately face sanctions. For member states sharing the euro currency, this could take the form of warnings and ultimately financial sanctions including fines of up to 0.2% of GDP, if they fail to abide by either the preventive or the corrective rules, or 0.5% of GDP, if they repeatedly fail to abide by the corrective rules. In addition, all member states (except the United Kingdom) could see a suspension of commitments or payments from the EU's structural and investment funds.

## Legislation to Reinforce and Strength SGP
